A valve, d, is so constructed as to admit the air blown through the plug into the barrel, but, by pressure on the orifice b, to prevent its escape.

Claim.—The improved tester-plug, for barrels and other air-tight receptacles, consisting of a hollow conical plug with entrance-hole and vertical check-valve, constructed and operated substantially as and for the purposes described.

144,882.—Rotary Engine.—SAUL BAKER and SAMUEL C. MCINTIRE, Springfield, Ohio. Application filed April 12, 1873.

Claim.—The combination of the pistons G G, connected together by the bow g with the cylinder A, and operating in connection with the inner face of the cylinder, formed as described, whereby said pistons are allowed to remain stationary, relatively to the piston-head, during the greater part of their revolution, and the power of the steam acting thereon is equalized, as set forth.

144,883.—Steam-Engine.—ABRAM BEEKMAN, New York, N. Y. Application filed October 4, 1873.

A sliding valve governs the admittance of steam from the boiler to the rotary chamber. Within the boiler a cone is arranged, beneath which the steam is generated.

Claim.—1. The single slide-valve J, arranged between parts A C of boiler and under the wheel F, as described, to be operated in the manner and for the purpose set forth.

2. The cone B, arranged beneath the water of a boiler, as and for the purpose specified.

144,884.—Locomotive Smoke-Stack.—JOHN V. BISHOP, Atlanta, Ga. Application filed July 26, 1873.

The deflectors direct the products of combustion against the side of the stack, while the open tubes prevent the egress of the rebounding cinders and permit large openings to be made in the discharge-tube.

Claim.—The combination, with deflectors J G, of the open tubes F F, arranged as described, in the side of the ordinary discharge-tube D of a smoke-stack, substantially as described.

144,885.—Glass Bottle.—JOSEPH BORDEN and JAMES L. TRIMBLE, Medford, N. J. Application filed November 10, 1873.

To prevent breakage of imperfectly-annealed bottles when corking them. A metallic removable head is attached to the neck of the bottle by screw-threads. An elastic cushion is interposed between the metal and the glass.

Claim.—1. The metallic head c, constructed substantially as set forth.

2. The combination of the glass neck a, the metallic head c, and the interposed elastic cushion d, in the manner and for the purpose substantially as set forth.

144,886.—Nut-Lock.—WILLIAM H. BOWMAN, London, Ohio. Application filed July 26, 1873.

A washer projecting laterally beyond the nut is connected to the bolt and turns with it. The projecting edge of the washer is perforated, and a pin inserted that bears against the side of the nut.

Claim.—The edge-perforated washer A, connected and turning only with the bolt, and projecting laterally beyond the nut or nuts, combined with pins I to lock the nut or nuts, in the manner described.

144,887.—Cherry-Stoner.—ELI BUCK and EDGAR W. KIRK, Cincinnati, Iowa. Application filed October 11, 1873.

An inclined pan or hopper with a frame projecting above it and grooves and holes in the bottom. In the frame is a bar with punches that slide on ways, when operated by a crank-shaft above them. To one end of the crank-shaft is attached a short crank which is connected with a vertical rod, and two other cranks that move a reciprocating pan under the punches.

Claim.—1. The combination of the pan A, provided with discharge-openings a'', with the reciprocating punches D, stripping-plate H, and sliding discharge-apron T, the various parts being constructed to operate in substantially the manner herein shown and described.

2. The reciprocating punches D, operated through the medium of devices which serve to actuate the sliding discharge-apron T, causing the latter to move backward when the punches rise, for receiving the stoned cherries, substantially as herein set forth and shown.

144,888.—Fishing-Stake.—JOHN O. CAMPBELL, Alpena, Mich. Application filed May 24, 1873.

To obviate pulling up and replanting fishing-stakes every season, the tops are made detachable by means of a fishing-rod joint, to which is added a spring-catch which engages with a slot in the band.

Claim.—A fishing-stake consisting of two parts, A D, detachably connected together by a socket, B, and spring-catch E, substantially as specified.

144,889.—Hasp for Butter-Tubs, &c.—HENRY C. CARTER, New York, N. Y. Application filed September 13, 1873.

The lower hinged part of the hasp is of elastic metal and convexed outwardly. A turn-button works through a recess in its lower part, and is held in position more firmly by the spring of the hasp.

Claim.—1. The hasp B, convexed outwardly and made elastic, combined with the swiveled staple, as and for the purpose specified.

2. The combination of the spring-hasp having recess c, and rotating staple E having projection d, as and for the purpose described.

144,890.—Farmer's Boiler.—PASCHAL COLVIN, Pecatonica, Ill. Application filed November 21, 1872.

This heater is to be placed in a vessel containing water or the food to be cooked. The smoke flows through the circuitous passage from the fire up to the exit-flue, so as to heat the exterior casing. Through suitable openings in the top air is admitted and fuel supplied.

Claim.—1. In combination with the inner shell F, the partition G and flanges or angle-irons e, substantially as described.

2. In combination with the outer shell E, the inner shell F having one end thereof formed into a scroll, F^2, and serving as a support for the pipe H, substantially as described.

144,891.—Device for Wetting Grindstones.—DAVID CUMMING, Jr., Jersey City, N. J. Application filed September 8, 1873.

Claim.—1. The roller or wheel f, applied in the water-trough of a grindstone, and movable so as to be brought into contact with such grindstone, substantially as set forth.

2. A wheel or roller of felt, or other material, set diagonally to the axis, and applied to and combined with a grindstone and its water-trough, as and for the purposes specified.

144,892.—Automatic Toy.—ALBERT H. DEAN, Bridgeport, Conn. Application filed February 25, 1873.

A toy see-saw operated by clock-work.

Claim.—1. In combination with the standards A, the pivoted balance B carrying the toy figures C at each end, and provided with the slotted guide-piece b for the reception of a crank-arm operated by clock-work, substantially as described.

2. In combination with the subject-matter of the preceding claim, the toy figures C, provided with the loosely-jointed metallic legs, as and for the purpose specified.

144,893.—Folding Pail.—ARRILLARD DU CHATEAU and JOHN D. WILLIAMS, Green Bay, Wis. Application filed May 10, 1873.

The sides of the pail are made of a flexible material, so as to fold, and braces extend from top to bottom, with joints in them, to hold the pail in an extended position when desired.

Claim.—A folding pail, composed of the india-rubber or other equivalent elastic tube A, hoops B C, rubber, metal, or wood bottom D, and the folding braces F, all substantially as specified.

144,894.—Spring-Power.—THEODORE EISELEN, San Francisco, Cal. Application filed October 21, 1873.

A flat steel spring is attached to the shaft carrying the main wheel, which drives a suitable train of wheels. The other end of this spring is secured to the free end of a heavy steel spring, which is secured to a shaft journaled in the opposite end of the frame and provided with a ratchet and pawl, the latter serving to adjust the tension of the spring.

Claim.—1. A train of gears, a b c d, in combination with the spring I, applied as described, and flat spring i, which serves both as a spring and connecting chain or belt, substantially as and for the purpose specified.

2. The re-enforcing power, consisting of the levers m with their weight p, in combination with the shaft i, in the manner substantially as described.

144,895.—Fire Indicator and Alarm.—JOHN FAWCETT, East Boston, Mass. Application filed August 23, 1873.

A metallic cage contains an easily-ignitible substance arranged under a combustible cord holding a trip-lever, with which is connected a wire leading to an alarm and indicator. Several cages may be connected together.

Claim.—1. The combination of a connecting-wire, E, tripping-lever C, combustible cord D, and a card of matches, B, or other equivalent easily-ignitible material, with an indicating-disk, H, spring I, and an alarm mechanism, K, the matches, combustible cord, and the trip-lever being in a metallic cage in the room to be signaled, and connected by the wire with the indicator in the room in which the signal is to be received, substantially as specified.

2. The combination of the chain R, the revolving disk P, and spring Q applied to the axis thereof, with the combustible cord D, arm O, catch-arm C, and the matches B, or equivalent ignitible material, as and for the purpose specified.

144,896.—Manufacture of Copper Ingots for Alloying Gold and Silver.—JOHN FELIX, San Francisco, Cal. Application filed August 15, 1873.

Claim.—1. The process herein described for removing oxides from metallic copper, consisting in melting the copper and treating it while at rest with flame from wood, substantially as described.

2. The method of giving a bright red color to copper, consisting in treating it in a crucible, molding it into ingots, and cooling, substantially as described.

3. The new article of manufacture, of dark cherry-red ingots of copper, made substantially as and for the purpose set forth.

144,897.—Reversible Center-Pinion for Watches.—OLMSTED GATES, Columbus, Ohio. Application filed October 3, 1873.

The center-pinion is locked or released, according to direction of rotation, by an obliquely-grooved tenon rigidly attached thereto, and a projection from the inside of a cup-like expansion at the base of the arbor.

Claim.—The cup C and tenon D, in combination with arbor I and wheel A and pinion B, and secured by the groove E and clutch G, or their equivalent, substantially as and for the purpose hereinbefore set forth.

144,898.—Blind-Hinge.—LOUIS GATHMANN, Chicago, Ill.—Case G. Application filed June 2, 1873.

The lower one of a pair of blind-hinges made with screw-attachments, cast with a series of notches or serrated teeth on the outer edge of its eye-piece, which remain open by the weight of the blind.

Claim.—The lower hinge, composed of the screw-hook C and the screw-eye C^1, having serrations or teeth, as described, for the purpose set forth.

144,899.—Leather-Splitting Machine.—JOHN GOEBEL and JACOB PERR, Caledonia, Wis. Application filed June 30, 1873.

The roller E is made vertically adjustable by means of a sliding rack, upon which the pinions of a transverse shaft rest, which support the bearings of the roller.

Claim.—In a leather-splitting machine, the rollers E, F, and L, knife G, rack B, spring M, and pinion C, constructed and arranged as and for the purpose specified.

144,900.—Spoke-Setting Machine.—WILLIAM R. GREENE, Juda, Wis. Application filed August 23, 1873.

The spoke is placed in a case, which prevents its splitting or bending while being forced into the hub by a screw, which is operated by miter-gears.

Claim.—1. The spoke-setting frame L, consisting of top piece p, slide-pieces g, and bifurcated clamps r, which hold the sleeve M, as set forth.

2. The sleeve M, having wedge-shaped side ribs t and perforated end u, for the purpose described.

3. The grooved guide-pieces I, having steps or pins v' for engaging rods v of clamps r and detaching them from sleeve M, as described.

4. The bifurcated clamps r, being arranged in different lengths to hold sleeve M in inclined position, and having rods v, for the purpose specified.

5. The combination of spoke-setting frame h, sleeve M, guides I, frame A, and gearing o o' for seating the spokes in the hubs, arranged substantially as and for the purpose described.

144,901.—Anchor.—ZEBINA HALL, Dennis, Mass. Application filed August 7, 1873.

Claim.—The circular frame c, having the cross-bars extending across its center, between which the single-pointed fluke 5 7 8 is pivoted so as to play back and forth, the fluke having a circular slot, 9, cut through its end so as to limit its movement, substantially as specified.

144,902.—Stuff-Regulator for Paper-Machines.—DAVID HAMEL, Holyoke, Mass. Application filed October 11, 1873.

The stream thrown by the pump through pipe H being constant, variations in the height of float G are caused by the variable consistency of the stuff. When the float rises, on account of thickness of the stuff, it closes, by means of valve E, the port F leading through chamber C to the screen, and causes a less quantity to be spread upon the screen, while at the same time valve E' rises port F' is opened, and the stuff flows freely back through chamber D and pipe to the reservoir. If the stuff is thin, float sinks, valve E rises, and a greater quantity is spread upon the screen, and less goes back to reservoir. I and J are gates attached to rock-lever K, and serve to close completely ports F and F', respectively, when it is desired to shut off flow of stuff from chamber B either to the screen or back to the reservoir.

Claim.—A self-acting stuff-regulator for paper-machines, consisting of the compartment B, float G, and valves E E', combined with the passage H from the main reservoir to the paper-screen, and a return-passage to the said reservoir, the valves being connected to said float, so as to be worked reversely to each other.

144,903.—Shank-Luster.—WILLIAM HAMILTON HANNA, Chico, Cal. Application filed October 4, 1873.

Claim.—1. The nipper-jaws A B, wedge C, screw-rod E, cranked nut G, rest F, and strap I, combined and arranged substantially as specified.

2. The strap I, in combination with the rest F H and suitable griping and stretching devices, supported by said rest, all as shown and described, whereby said parts are adapted to be applied to a last, and to operate as specified.

144,904.—Furnace for Desulphurizing Ores.—EDWARD C. HEGELER and FREDERICK W. MATTHIESSEN, La Salle, Ill. Application filed September 14, 1872.

The ore in powder is fed in at the top of the furnace, and flows down in a zigzag course as it is let out at the bottom by regulating devices.

Claim.—1. The furnace-shaft A, provided with zigzag columns or troughs C C, containing and supporting the ore, with sufficient opening at the bottom of each trough to allow the ore to slide through to the trough below, as described above, for the purposes therein set forth.

2. The modified form of the troughs, as shown in Figs. 3, 4, and 5, for same purposes as in claim 1.

3. The provision or arrangement, in the shaft A, of the gas-passages, through which the desulphurizing-gases pass under and in close contact with the column of ore, stationary or in movement, as above described.

4. The air-passages d d, as shown in Fig. 3, in connection with the modified form of the troughs, shown in Figs. 3, 4, and 5, the descent of the material on which is caused by an apparatus removing said material at the bottom of said furnace.

5. The revolving overshot-wheels D, arranged in relation to the bottom troughs of each ore-column, as and for the purpose specified.

6. The overshot-wheel D, for the purpose specified, revolved by the weight of the ore which it receives into its buckets, and controlled in its revolutions by the pendulum G.

7. A desulphurizing, calcining, heating, or drying shaft-furnace for fine ore or other fine materials, arranged, as above specified, to subject the ore or other materials to the action of the heated gases for a longer or shorter time, as may be necessary.

144,905.—Nut-Lock.—CHARLES A. HOWARD, Pontiac, Mich. Application filed June 26, 1873.

The extended plate is provided with a slotted spring end. The locking-plate is passed through the slot and interlocked, the spring holding it normally on a plane with the extended plate.

Claim.—The combination of the interlocking-plates E F with the nuts G H, the extension m of the plate E forming the spring, and the plate F interposed between the said nuts, substantially as described.

144,906.—Bed-Bottom.—EDWIN HOYT, Stamford, Conn. Application filed October 7, 1872.

The slat-frame has on its under side short studs descending into spiral springs, which rest on the frame beneath. Lateral bars on the top frame have affixed beneath them bolts, that prevent sagging by passing freely into lateral bars below.

Claim.—The bed-bottom, substantially as herein described, consisting of the supporting-bars a, cross-pieces c l, springs g, studs i, side rails d, bolts e, and slats e, the parts being arranged as shown and described.

144,907.—Bird-Cage.—EDWARD HUTCHINSON, New York, N. Y. Application filed August 16, 1873.

Claim.—A perch for bird-cages, consisting of two parts, A B, tongued and grooved together, and so united as to form cracks E for insects to conceal themselves in, substantially as specified.

144,908.—Machine for Turning Carriage-Axles.—WILLIS JONES, Brooklyn, N. Y. Application filed May 2, 1873.

The plate f supports the axle while the pressers i k hold it against the cutters d e. The cutter e is made in three parts to operate upon the shoulder of the axle. All the plates are adjustable as well as the stocks A and c by which they are held.

Claim.—The stock c, constructed as specified, and supporting the adjustable cutters d and e and presser f, in combination with the stock A and presser or pressers k l, the parts being adjustable, substantially as and for the purposes set forth.

144,909.—Pneumatic Station-Indicator.—JAMES P. KEALY and JOSEPH RIGNEY, Bridgeport, Conn. Application filed August 9, 1873.

Station-indicators, consisting of chains of name-plates in each car of a train, are connected to pneumatic engines, which are operated by compressed air from an air-pump connected therewith by tubes, the air passing through each engine to the next. The action of the indicators is reversed by fan-wheels, properly connected, located on top of each car.

Claim.—1. The chain of name-plates, arranged on a single roller, to be transferred from one side of the case to the other, and vice versa, and attached at each end by an expanding and contracting connection, substantially as and for the purpose specified.

2. The case containing the roller and the chain of name-plates, divided into two compartments by a partition, I, either stationary or pivoted, substantially as specified.

3. The slotted toothed bars U, pivoted to the piston of the air-engine, connecting-yoke T, stationary bar A', and stud-pins C, combined with the loose wheel O, double pawl N, cam R, and the ratchet-wheel J on the name-plate roller-shaft, substantially as specified.

4. The combination of the shifting-cam R and lugs S of yoke T with the double pawl R, substantially as specified.

5. The combination of a spiral wind-wheel, mounted on the car so as to be subject to the atmosphere, with the reversing toothed bars U, when connected to them by a sliding bar, F', rock-shaft J', connecting-rods H' I', and arms I' and K', or any equivalent connecting apparatus, substantially as specified.

6. The spiral wind-wheel, connected to the rock-shaft J' by a reversing-link, K', substantially as specified.

7. The series of annunciators, connected together and to the air-forcing pump Y by pipes Z and Z^1 and valves Z^2, substantially as specified.

144,910.—Refining Varnishes.—FRANKLIN KERSTING, Grand Rapids, Mich., assignor of two-thirds his right to CARL RUDOW and BENJ. F. BROADWELL, same place. Application filed October 12, 1872.

Claim.—1. The method, substantially as described, of clarifying and improving the luster of varnishes, and clarifying all manufactured liquids.

2. In such method, the employment of burnt, ground, or powdered oyster-shells.

3. In such method, the combination of pulverized marble and ground burnt oyster-shells, or their equivalent.

4. As a new article of manufacture and trade, varnish rendered clear and of improved gloss and elasticity, as herein described.

144,911.—Skeleton Skirt.—PHILLIPP LIPPMANN, New York, N. Y. Application filed October 30, 1873.

Claim.—A skeleton skirt in which the horizontal hoops b are supported upon and by flaps d woven upon the faces of the vertical tapes a, the hoops being passed through openings d' in the flaps made in the weaving, or otherwise by puncture, substantially as set forth.

144,912.—Garden-Cultivating Implement.—DAVID MACK, Barnesville, Kans. Application filed June 26, 1873.

To the front end of a jointed beam a bearing-roller is attached, and to the rear a braced standard, carrying a weed-cutter, a rear roller, and a rake, pivoted to the standard, and hanging over the weed-cutter a little in the rear of its cutting-edge.

Claim.—The combination of wheel D, jointed beam E A, rear roller L, and standard F, with horizontal weed-cutter J and rearward-superposed rake I, as and for the purpose described.

144,913.—Holder for Soda-Water Tumblers.—JOHN MATTHEWS, New York, N. Y. Application filed November 6, 1873.

The holder has a base-ring, to which is attached a handle and projecting wires, that secure an upper ring, into which the tumbler is to be set.

Claim.—1. A cup-holder composed of a base-ring and a series of body wires or pieces united therewith by means of holes or recesses, as set forth.

2. In combination with the upper ring of a tumbler-holder, the body-wires embracing or inclosing the upper ring, substantially as and for the purpose set forth.

3. The combination of a handle having a button or lug, c, and with the base-ring having a dovetailed slot or recess, and the body-wire, substantially as and for the purpose set forth.

4. The combination of base-ring A, the body-wires c, and the upper ring b, relatively arranged as and for the purpose specified.

144,914.—Weighing and Price Balance.—ALBERT M. MAYNARD, Savoy, Mass. Application filed September 30, 1873.

An equal-arm balance has an attachment by which, at any price per pound, the total price of the article weighed is shown. Weighs in pounds and ounces simply if the computing device is detached.

Claim.—1. The combination of the platform P', connecting-rod r, and the saddle-piece upon the scale-beam, substantially as specified.

2. The combination of an apparatus for weighing in pounds and ounces and a separate price-computing attachment, which may or may not be used in connection therewith, substantially as shown and described.

3. The combination of the equal arm-balance, central beam s, and graduated bar U, and connecting-rod r, or its equivalent, substantially as and for the purpose set forth.

4. The combination of the base-plate a and standards b c d, having arms projecting over the base-plate, with the duplex apparatus described, substantially as shown.

5. The saddle-piece g, having the lugs l l', in combination with the hooks Q Q', substantially as specified.

6. The scale-beam consisting of the central beam s and parallel arms s' s'', provided with knife-edges cast in one piece with the block t, and having the graduated bar U attached thereto parallel with the central beam, substantially as described.

7. The sliding bracket g, and the small bracket thereunder, for holding the knife-edges of the scale-beam in position, substantially as set forth, and combined as shown.

144,915.—Knit Fabric.—BERNARD J. MCGEE, Watertown, Mass., assignor to JOHN W. TUTTLE, same place. Application filed October 31, 1873.

Made on a machine having a single row of needles and two guide-bars, each carrying half as many guides as there are needles. The guide-bars are traversed across each other, first in one direction and then in the other, and lay a yarn over each needle to form the bands, and then move in opposite directions horizontally and vertically, so as to wind the yarn from two guides, a sufficient number of times, around alternate pairs of needles to form the coils or tufts.

Claim.—The new fabric composed of the chain-stitch bands and the ranges of tufts, made and combined substantially as described.

144,916.—Flower-Maker's Grass-Cutting Machine.—THEOPHILUS MILLOT and JAMES MILLOT, New York, N. Y. Application filed August 30, 1873.

Treadle pressure gives a shear cut of any length and thickness desired, the pile of material being securely fastened to a cutting-board, movable in guides upon the supporting-bed, which allow a feed-motion of the material to the shear-blade. A narrow adjustable cutter for trimming the points of the grass-blades is arranged in front of the larger cutter, to point them before cutting out.

Claim.—1. The combination of a cutting-board, E, and a clamp for holding the pack of material to be cut or said board, with a paper-cutting machine, the said board being arranged on a feed-guide having adjustability laterally to the feed, for shifting the pack to the position for cutting the slits, and also to the position for cutting off the bunches, substantially as specified.

2. The combination of the point-cutter Q with the cutter C and cutting-board, substantially as specified.

3. The said point-cutter connected with the shifting cutter-board guide H, to be shifted with the board, substantially as specified.

4. The said cutter Q, arranged on a movable support, in combination with an incline on the cutter C, that moves it out of the way of the said cutter C when the latter descends, substantially as specified.

5. The combination of the paper or cloth guide k with the cutting-board, substantially as specified.

6. The arrangement of shifting-guide H, standard K, swinging rod L, adjustable cutter-support O, and spring Z with the cutter C and table B, substantially as specified.

7. The point-cutter Q, arranged to work in an inclined plane coinciding with the shearing inclination of the cutter C, substantially as specified.

144,917.—Adjustable Blackboard.—PETER W. MOELLER, New York, N. Y. Application filed October 25, 1873.

Two blackboards, hung in a frame, sliding in grooves and connected by cord suspended upon a pulley, are each reversible by lowering to the bottom of the grooves, which are there wider, to allow of their removal.

Claim.—1. The combination of the blackboards C C, counterbalanced by each other, and suspension-cord L with the frame A, grooved upon the inner surfaces of its side bars to receive the edges of said blackboards, arranged to operate substantially as herein shown and described.

2. In combination with the blackboards C C, the grooves in the frame A, made deeper in their lower parts, at one side, to enable the boards C to be removed and turned, substantially as herein shown and described.

144,918.—Corn-Coverer.—JOEL A. MOORE, Salem, N. J. Application filed August 4, 1873.

A corn-coverer provided with two rollers, one in front for crushing the clods, and the other in the rear for leveling. The rear roller is pivoted in arms projecting from the rear of the frame. Between the two rollers are secured ridgers for forming the earth into a ridge to receive the seed.

Claim.—The combination described, with the ordinary ridges C and leveler D, of a front clod-crusher, B, that pulverizes the clods before they are raked up into the ridge intended to receive the seed.

144,919.—Hand Corn-Planter.—MICHAEL P. NEMMERS, St. Donatus, Iowa. Application filed May 24, 1873.

The seed-disk is rotated by the teeth engaging with a cam-shaped plunger, every downward stroke revolving the disk through a given space. Beneath the disk is a perforated plate, one end of which is raised or lowered by a bent lever projecting through one side of the box beneath the seed-disk, adjusting the plate to increase or diminish the amount of seed discharged.

Claim.—1. The combination, with the recessed plate l, arranged beneath the disk H, of the lever M, working through the slot m' of the hopper, as shown and described.

2. The combination, with the disk H, provided with the teeth g and perforations f, of the projection F, the cam projection E, and spring b, as shown and described.

144,920.—Barrel-Hoop.—HARRISON OSBORN, Richmond, assignor of one-half his right to SAMUEL WATSON, Lewisville, Ind. Application filed May 15, 1873.

A peculiarly-formed clasp is used for securing the ends of the hoop.

Claim.—1. Staples E E constructed with a hole in their central or middle part, for the purposes herein specified.

2. The staples E E, in combination with nail P, when used to unite the ends of hoop B, in the manner substantially as shown and described.

144,921.—Woven Corset.—JULIUS OTTENHEIMER, New York, N. Y., assignor to OTTENHEIMER, ROTHSCHILD & Co., same place. Application filed November 8, 1873.

The clasps or busks at the front are of greater width at the bottom than at the top, and the corsets have woven pockets adapted to receive them.

Claim.—A corset woven with the edges d d of the front busk-pockets diagonal to the edges c c and with the pockets for the ribs or bones d e, extending from near the diagonal edges d d toward the top edge of the corset, substantially as set forth.

144,922.—Machine for Finishing Horseshoe-Nails.—SILAS S. PUTNAM, Boston, Mass. Application filed May 31, 1873.

Two levers, pivoted on pins projecting from a plate capable of movement on trunnions, carry at one end the halves of a divided conveyer, the inner sides of which are tapering, and are operated to grasp the nail, after the head has passed through, by means of a spring-arm carrying a wedge that is forced between the ends of the levers, while another spring is thrown forward against an incline on the under side of the levers, to depress the conveyer and insure the entrance of the nail between the rolls, one of which is concentric, and the other eccentric. The rolls are fastened to their shafts by sleeves and nuts pressing them on tapered portions of the shafts.

Claim.—1. The combination of the rolls H H and a conductor, I, formed of two movable clamping portions, operated by suitable mechanism, as set forth.

2. In a nail-finishing machine, the sleeve K and screw-nut *l*, in combination with the shaft *a* or *e* with its tapering portion 11, the boxes *f f*, and the roll H, all constructed and operating substantially as and for the purpose described.

144,923.—Process for Purifying Quicksilver.—James B. Randol and Charles W. Wright, New Almaden, Cal. Application filed October 4, 1873.

Claim.—The process of purifying mercury by treating it, under agitation, with heated water and alkaline matter, substantially as set forth.

144,924.—Revolving Sample-Case.—John F. Randolph, Edwardsburg, Mich. Application filed August 30, 1873.

Claim.—The improved revolving show-case herein described, formed of the polygonal base B, the vertical partitions C, arranged radially around the shaft, and the triangular removable trays D, supported between said partitions in an inclined position by side and front strips *a b*, all as shown and described.

144,925.—Road-Scraper.—Roland F. Read, San Francisco, Cal. Application filed September 3, 1873.

The scraper is mounted upon jacks, which move longitudinally in ways, so that it can be adjusted at any required angle to the line of draft. These jacks carry long levers, by which the scraper is elevated, said scraper being retained in its elevated position by confining the long arms of the levers by means of the racks J. To compensate for the side draft of the machine, when the scraper stands at an angle, the rear wheels are directed by a foot piece within reach of the driver's seat.

Claim.—1. The parallel timbers C C mounted upon wheels A B, and having the longitudinal mortise or slot A, in combination with the adjustable lifting-jacks I, cords or chains *t*, and scraper E, substantially as and for the purpose above described.

2. The scraper-wagon, having the braces *z* and *v*, in combination with the lever *y*, rack Z, and connection N, for the purpose of adjusting the rear wheels in reference to the scraper, as set forth.

3. The scraper E and lifting-jacks I, with their levers K, all adjustable laterally, in combination with the rack-standard J, as set forth.

144,926.—Door-Spring.—Francis H. Richards, New Britain, Conn. Application filed June 7, 1873.

A cylinder, containing at one end a piston and at the other a coil-spring, is arranged in a tubular case over the top of the door. A fixed bracket upon the frame carries a pin which passes into the rear end of this case, and a second bracket upon the door itself is connected with a movable plug located in the center of the tube. As the door opens the last-mentioned bracket forces back the plug, which latter carries with it the coil-spring. When the door is released the coil-spring closes it, but the piston prevents slamming.

Claim.—1. The combination of the piston G, cupped packing H, and tube D with the bracket C E and spring F, or equivalent, substantially as herein shown and described.

2. The grooved screw I, for adjusting the vent, in combination with the packing H, piston G, tube D, and coiled spring F, or equivalent, substantially as herein shown and described.

3. The employment of a bracket, E, working in a slot in the tube D, for connecting the packed piston with the door, substantially as herein shown and described.

144,927.—Hand Cultivator.—Amos W. Ross, Northfield, Mass. Application filed September 13, 1873.

To the axle near the wheels are pivoted bars which extend rearward and pivot to the rear ends of an expansible V-shaped frame, the front end working through a keeper upon the axle. A lateral adjustment is effected by means of a lever, attached by a link to one of the rear pivot-joints, and extending parallel with one of the handles. Upon the axles are guards for protecting the plants, and hilling-shares are attached to the expansible beams.

Claim.—The combination of the wheels A, axle B, handles C, and cross-bar D with the pivoted side bars F, pivoted middle bars G, the plows, the keeper H, guards I, and hillers M, substantially as herein shown and described.

144,928.—Manufacture of Sulphuric Acid.—Joseph Saunders, Brooklyn, N. Y. Application filed November 8, 1873.

The balls will be some six inches in diameter, and arranged with one of the openings at the top in the tower in which the gases descend, and the reverse in the tower through which the gases ascend.

Claim.—Hollow balls of glass for sulphuric-acid-condensing towers, substantially as specified.

144,929.—Inkstand.—Thomas S. Shenston, Brantford, Canada. Application filed January 3, 1873.

Claim.—1. An ink or mucilage stand or receptacle having a tube projecting into its chamber, whereby it is adapted to be inverted without discharge of its contents, in combination with a receptacle for liquid for temporarily sealing the mouth of said tube, as set forth.

2. In combination with the sealing-liquid receptacle, the stand A, provided with the tube *b*, projecting upward in the conical cavity C, and downward into the chamber B, as and for the purpose specified.

144,930.—Railway-Switch.—William A. Slingerland, New York, N. Y. Application filed October 11, 1873.

An arrangement by which trains coming from a siding are always conducted onto the main track. Three sets of movable switch-rails are placed in conjunction with the ends of the main and side tracks. Corresponding fixed rails match the movable rails. The two outer sets of rails converge to the main track through fixed inclined rails or guide-pieces. The middle set of rails is always in line with the main track.

Claim.—The combination, with main track A A and branch B B, of intermediate short tracks C D E, having each a switch at one end and a frog or turn-in at the other, as and for the purpose described.

144,931.—Door-Latch.—Frank Stowe, Huron, Ohio. Application filed September 27, 1873.

A sliding spring-dog, having a rubber cushion in its outer end, is arranged in the front part of the latch-case, so as to engage and hold the bolt when it is drawn back by the knob. On closing the door the rubber cushion strikes against the jamb of the door and forces the dog inward, thereby releasing the bolt and allowing it to be thrown outward into the keeper.

Claim.—The dog C, carrying socket *b*, with rubber cushion C', and having sidewise-projecting lug *d* for engaging the bolt, as described.

144,932.—Spark-Arrester.—Gustaf Swenson, Hackensack, N. J., assignor to himself and Peter Bogart, Jr., same place. Application filed September 27, 1873.

Within the hood of the smoke-stack a vertical plate is arranged to direct the current of air upward through said hood.

Claim.—The vertical plate J, arranged in the conical hood with relation to the tubes I, guides D E, and top of the stack B, as shown and described, for the purpose specified.

144,933.—Combined Stubble Shaver and Scraper.—Henry Von Phul, Jr., and James Mallon, Holly Wood, La. Application filed August 16, 1873.

A curved vertical cutter, designed to split the rows of sugar-cane stubble, is mounted upon a frame with runners. The cutter is followed by a pair of oblique horizontal knives, behind which is a triangular scraper, the last two being adjustable as to height by means of bars and cranks operated by a lever.

Claim.—1. The combination of the knives G, sliding angular bars H, connecting-bars I, crank-arms J, shaft K, lever L, and catch-bar M, with each other and with the frame A D, substantially as herein shown and described.

2. The combination of the scraper R, bar Q, and lever P with the shaft K, having crank-arms O, the lever L, knives G, and bars H, all as shown and described, whereby the two cutting devices may be simultaneously raised and lowered by operating said lever, as set forth.

3. The combination of the cutter T with the knives G, scraper R, and frame A D, substantially as herein shown and described.

144,934.—Adjustable Bench-Vise.—Jeremy B. Wardwell, Lawrence, Mass. Application filed November 1, 1873.

The clamping device is made adjustable vertically to suit the varying widths of plank.

Claim.—The jaw B, frame or spider C, rest D, single pawl E, and double pawl F, in combination with each other and with the stationary slotted and notched or toothed bar A, substantially as herein shown and described.

144,935.—Road-Scraper.—Moses E. Warner and Seth W. Kingsley, Hatfield, Mass. Application filed October 29, 1873.

The scraper is attached to a freely-moving draft-bar in the ordinary manner, and said draft-bar is controlled from the driver's place by a chain-windlass and lever, which latter is operated by a strap, winding-drum, and hand-wheel. The draft-bar with the scraper is by this means readily lifted by the driver when necessary, and a second man dispensed with.

Claim.—The combination of the shaft 5, drum 6, hand-wheel 8, stop or catch 9, chain or strap 7, lever 3', and drum 2' with the chains 4' and draft-bar *d*, carrying the scraper, substantially as shown and described.

144,936.—Coffee-Pot.—John E. Weber and Peter Knudson, La Crosse, Wis. Application filed May 24, 1873.

An upper chamber contains water, and a lower chamber contains ground coffee. A lamp is placed under the upper chamber which when lighted heats the water until pressure is created, which forces the water into the lower chamber and permeates the coffee. The lamp is extinguished, and a vacuum forms in the upper chamber by condensation, causing the liquid to return. A glass bulb indicates the passage of the liquid from one chamber to the other.

Claim.—1. The coffee-pot A, consisting of the water-receptacle B, the middle part C, and the lower receptacle D, the parts B and D being connected by tubes *b* and *f*, having strainer E, substantially as and for the purpose described.

2. The water-receptacle B, having tube *b* with extension glass bulb *d*, for indicating the boiling process, and tightly-closing lid *a*, as described.

3. The lower receptacle D, having tube *f* with strainer E, supported by wires *g*.

144,937.—Heater and Feeder for Boilers.—Garner C. Williams, Catskill, N. Y. Application filed January 25, 1873.

The feed-pipe connects to the front and rear ends of the boiler by branch pipes, and by a central pipe with the lower pipe of the boiler. In said feed-pipe are arranged injectors, with their mouths projecting above the branch pipes, and thereby create the circulation of the water through the boiler from the rear to the front end, upon the Giffard principle.

Claim.—The combination, with boiler-piping H E D E H, of the injection G and G' feed-pipe B inserted at C, and having its end projecting above that of boiler-pipe D and pipe D', as and for the purpose described.

144,938.—Machine for Cutting Veneers.—William H. Williams, Green Point, (Brooklyn,) assignor to John R. Graham, New York, N. Y. Application filed September 2, 1872.

The knife-carriage is adjusted on inclines M, and is moved automatically by screws K, so that the pitch of the knife *f* is maintained as the log is reduced in its diameter by successive cuts.

Claim.—1. The log-holder frame D, constructed of a beak bar or brace arranged in rear of the trunnions *b b*, and radial projections from the trunnions at the ends of the frame, in combination with the log-holder B, with its end ways or slides *c c*, intermediately-arranged sliding guides or stays *d d*, and the set-screws *e e*, the whole being arranged for operation substantially as specified.

2. The adjustable inclines M M, in combination with the cross-shaft N, the bevel-wheels *n n o o*, the screws *p p*, and the sliding or reciprocating knife-carriage J J', whereby the angles of both inclines may be simultaneously changed, essentially as and for the purpose herein set forth.

3. The combination of the toothed segments or segment-levers E E, the pitmen G G, the wheels H H, the pinions F F, and the curvilinearly-reciprocating log-carrier B D, substantially as specified.

144,939.—Baking-Mold.—George Wingate, Boston, Mass. Application filed August 9, 1873.

The mold is provided with a sliding plug or cover that rests upon the upper surface of the bread, and is forced up thereby as it rises. A false bottom is also provided and attached to a rod passing through the bottom, by means of which the bread is forced out of the mold. The cover or false bottom may be provided with ornaments, figures, &c., which are imprinted on the top or bottom of the loaf.

Claim.—1. The mold A, with its extended top *b*, in combination with a plug or cover sliding therein, and provided, or not, with a device to produce a mark or impression on the top of the loaf, substantially as described.

2. The plate or disk D, provided on its upper side with letters or figures, or with a rib or projection, *i*, extending across it, substantially as and for the purposes described.

144,940.—Machine for Drawing Wire.—Joseph Woods and Edwin Woods, Warrington, Great Britain. Application filed September 22, 1873.

The wire is drawn through the dies, four in number, by intervening drums, around which it is wrapped three or four times as it passes from the plate, from whence it is continued through the next plate. The speed of the drums increases from the first to the last, to provide for the elongation of the wire.

Claim.—The series of two or more dies, with intervening drawing-pulleys moving at increasing surface speeds, substantially as and for the purpose hereinbefore set forth.

144,941.—Rotary Engine.—Leonard H. Woods, Syracuse, N. Y. Application filed October 18, 1873.

The revolving steam-drum is divided by a hollow exhaust-partition. Steam is applied to each section alternately through a hollow shaft, with suitable openings to hinged gates on the drum, working against double abutments, thus overcoming the dead-center.

Claim.—1. The rotary engine, consisting of the combination of steam-cylinder A, having abutments A', and exhaust-partition D, rotary drum B, and stationary hollow steam-shaft C, arranged substantially as and for the purpose described.

2. The rotating drum B, having sleeves or shaft extensions B', hinged vibrating gates *b*, and steam-ducts *d*, which are arranged in such a manner that those of one section are at right angles to those of the other section, for the purpose set forth.

144,942.—Stop-Nozzle for Hose-Pipes.—James N. Allen, Providence, R. I. Application filed November 3, 1873.

An exterior sleeve, with interior screw-threads, engages with a longitudinally-sliding bar or rack provided with incline teeth corresponding with the screw-threads on the sleeve, and connected to a plug-valve by a link, so that the rotation of the sleeve will effect a longitudinal movement of the rack and rotation of the valve.

Claim.—In a stop-nozzle, the combination of a rotating valve with an actuating threaded sleeve, a rack, and connecting-link, substantially as described.

144,943.—Pipe-Coupling.—Daniel Ashworth, Wappinger's Falls, N. Y. Application filed October 17, 1873.

A pair of annular disks, fitting loosely upon nipples behind their collars, interlock each in the other by external inclines and hook-shaped lugs.

Claim.—1. The combination of the disks B B, each having one or more hooked-shaped lugs, C, projecting from its face, notches D for the reception of the corresponding lugs C on its fellow, and external inclines *a* leading therefrom, substantially as and for the purpose herein set forth.

2. The combination, with the system of hook-shaped lugs C C, the notches D D, and inclines *a a*, of the segmental screw-threaded lugs *b* and *c* on each disk and their fellow leg D on the other disk, essentially as and for the purpose specified.

144,944.—Water-Wheel.—Benjamin J. Ransom, Ballston Spa, N. Y. Application filed November 13, 1873.

A counter-balance is arranged, in combination with the oscillating gates of a water-wheel, for relieving the gates from the pressure of the column of water.

Claim.—1. In combination with the oscillating gates of a water-wheel, a counter-balance attached thereto for relieving the gates from the pressure of the column of water, substantially as set forth.

2. In combination with the gates B and links and ring for operating the same, the weighted lever for adjusting the action of the counter-balance, substantially in the manner set forth.

144,945.—Dynamometer.—George W. Bemlow, New Haven, Conn. Application filed September 16, 1873.

A lever is fulcrumed upon an arm which revolves with a shaft. One end of the lever is connected by a link with the face of a pulley, the other with a bar which can slide in a slot through the shaft. This bar is connected with a spring and index, and its movement is the measure of the resistance overcome in turning the shaft by a belt on the pulley.

Claim.—1. The pulley A loose upon the shaft B, the lever C D having its fulcrum in connection and so as to revolve with the shaft, one arm, C, in connection with the said pulley, the arm D acting directly or indirectly upon a longitudinally-sliding bar, F, and a spring interposed between the said pulley and shaft to offer a resistance to the turning of one by the other, the construction and arrangement of the said parts being substantially as described, so that the power more than sufficient to overcome the said resistance will cause the said lever to turn and impart a correspondingly longitudinal movement to the said bar, and thereby indicate the amount of such power.

2. In combination with the pulley A, loose upon the shaft B, the lever C D, spring *d*, the transverse slide G provided with the incline *b*, and the longitudinally-sliding bar F, all substantially as described.

3. In combination with the pulley A, loose upon the shaft B, the two levers C D and C' D', the springs *d d'*, one or both of said levers acting directly or indirectly upon the longitudinally-sliding bar F, substantially as specified.

144,946.—Flattening-Oven for Plate-Glass.—John B. Boulicault, New Albany, Ind. Application filed March 21, 1873.

Double turn-tables in oven communicating with cooling-chamber, in which glass is stacked on slides I I.

Claim.—1. The combination of the two turn-tables C C' with the slides I and frames K, all substantially as and for the purposes set forth.

2. The frame *f* with friction-roller *i*, arranged in the center of the turn-table C' and operated by means of the lever G and spring *e*, substantially as and for the purposes herein set forth.

3. The combination of the slides I, frame K with rollers *h*, and the lever L, shaft *m*, and arm *k*, all constructed and arranged to operate substantially as and for the purposes herein set forth.

144,947.—Saw-Set.—William J. Boynton, Battle Creek, Mich. Application filed October 10, 1873.

Claim.—A saw-set combining in its construction two jaws, having a throat, *c*, to receive the extreme end of the saw-tooth to relieve it of pressure, two inclined faces for bending the teeth, and two flat surfaces for grasping and holding the saw-blades, arranged to operate substantially as herein shown and described, for the purpose specified.

144,948.—Compound for Filling Wood.—Cyrus E. Bradley, Wilmington, Del. Application filed October 10, 1873.

Claim.—A compound for filling the pores of wood-work prior to the application of varnish, consisting of a solution of para or india-rubber, shellac, litharge, and sugar of lead, compounded in the manner and about in the proportions substantially as set forth.

144,949.—Sleigh-Brake.—Thomas H. Bromley, Stonebrough, Pa. Application filed November 3, 1873.

Claim.—1. The brake-bar F, having the claw G and branching arms E E, in combination with the pendent arms D D and rock-shaft B, as and for the purpose specified.

2. The prongs I, pivoted upon the brake-bar F having the prong G, combined substantially as described, for the purpose specified.

3. The combination of the prongs I, brake-bar F having prong G, rock-shaft B, and arms E D, substantially as described.

144,950.—Writing-Tablet.—Charles M. Brown, Providence, R. I. Application filed October 3, 1873.

Ribs are attached to or formed on the leaves of an erasible tablet, to prevent the writing from becoming obliterated when the leaves are closed.

Claim.—An erasive tablet provided with the ribs B B, raised on or attached to the leaves thereof, substantially as and for the purposes herein set forth.

144,951.—Clothes-Drier.—Joseph Burch and Benjamin Webb, Warren, N. Y. Application filed March 29, 1873.

The clothes-drier is constructed with two elliptical plates, between which is pivoted arms so arranged as to fold closely within

them and against the back, which has at its center a bracket for its suspension or attachment.

Claim.—The clothes-rack herein described, having the elliptical plates B B', between which are pivoted the arms D, in the manner shown, together with the fastening-bracket C, the several parts being arranged as specified.

144,952.—Mordant for Dyeing.—RICHARD O. BURGESS and SAMUEL LA RENTY, Providence, R. I. Application filed October 25, 1873.

Sodium chloride, thirteen parts; binoxalate of potash, three parts.

Claim.—A color-mordant composed of the substances mixed together in about the proportions specified.

144,953.—Tack-Hammer.—GEORGE J. CAPEWELL, Cheshire, Conn. Application filed October 14, 1873.

A tack-hammer is provided with a pair of jaws for extracting tacks, one of said jaws being rigid and the other movable, the movable jaw projecting out and forming a fulcrum, to which is attached a spring for releasing the claws after the tack has been drawn.

Claim.—The herein-described tack-hammer and extractor, consisting of the hammer-head, the spring fulcrum-jaw, and stationary claw, the whole constructed to operate substantially as described, as a new article of manufacture.

144,954.—Car-Coupling.—ALBERT F. CHANDLER, Fall River, Mass. Application filed September 8, 1873.

The link on entering strikes the block E, which is driven along grooves in the draw-head until its arms *f*, coming in contact with the lever D, force it against the lower end of the link-holder, which is thereby thrown over and the pin falls into place. When the link-guide is raised its lever H forces the block E up against the link, and retains it against the pin at the desired height.

Claim.—1. The draw-head A, pivoted pin-holder B, lever D, and sliding block E *f*, combined to operate substantially as and for the purpose described.

2. The vertically-operating link-guide F, the lever G, and wedge-shaped bar H, in combination with the sliding block E and the draw-head of a car-coupling, substantially as and for the purpose described.

144,955.—Varnish or Polish for Wood, Metals, &c.—JEAN FRANÇOIS CHEVALIER, Lyons, France. Application filed November 6, 1873.

Claim.—The liquid polish composed of water, hydrochloric acid, alumina-calcareous earth, in the proportions and prepared substantially as specified.

144,956.—Car-Coupling.—JAMES T. L. COCHRAN, Columbia, Tenn. Application filed October 18, 1873.

The end of the link which fits in the cross-bar of the tender is rectangular, while that which enters the cross-bar of the coach is rounded, so that if the locomotive and tender should leave the track the link will be turned up-side down, and the pin will fall out, and thus release the cars.

Claim.—The bolt C, cross-bars A B, and pins *d e*, all combined substantially as and for the purpose described.

144,957.—Strap-Coupling.—THOMAS COGSWELL, Boston, Mass. Application filed September 25, 1873.

A metal strip is doubled midway of its length, and has a projecting pin on one part that extends through the strap, and also through an eye or slot in the other part. A swinging hasp correspondingly slotted catches into the protruding end of the pin, and locks the parts together. A sliding leather loop conceals the mechanism and holds the parts in place.

Claim.—1. The coupler *d*, having its parts which embrace the strap connected by the pin *f* and hasp *i*, substantially as shown and described.

2. In combination with the coupler, the sheath *m*, substantially as shown and described.

144,958.—Fireman's Ladder.—MARTIN CROHIN, Washington, D. C. Application filed October 18, 1873.

The main ladder is elevated by means of a short lever-ladder, which engages with the lower round of the main ladder in connection with ropes passing over the lever-ladder and fastened to the links E E. The main ladder is elevated by depressing the lever-ladder, which forms a short lever-arm, said main ladder being stiffened by a system of rope tension-stays. It is steadied in its elevated position by adjustable braces, and adapted to uneven ground by adjustable caster-wheels.

Claim.—1. The combination, with a ladder, of the lever-ladder D, the links E, ladder-halliards F, and hoisting-halliard G, constructed and arranged substantially as described.

2. The combination, with the ladder, of the extensible legs B and their caster-wheels, substantially as described.

3. The combination of the ladder, the extensible legs B, and the caster-wheels with the separately-adjustable foot-braces H, as and for the purposes specified.

4. The halliard-links F, in combination with side lines *p*, constructed and arranged as and for the purposes specified.

144,959.—Bed-Bottom.—LEWIS M. CROSBY and EZRA G. CAMERON, Ashtabula, Ohio; said CAMERON assignor to said CROSBY. Application filed July 2, 1873.

The slats lie on two lateral bands of webbing, each stretched along the top of a series of spiral springs, which rest on the front and foot pieces of the frame, onto the ends of which the webbing is drawn down and nailed. Another band is passed under the top coil of each spring, and nailed to the upper band. The apex of each spring (on which it stands) has its end straightened, passed down through a mortise, and then bent under the frame at a right angle.

Claim.—1. The coil-springs B, with straight projections *z* and angular ends *y*, in combination with the slats A with oblong slots, and the wedges *a*, all substantially as shown and described.

2. The combination, with the springs B and slats G, of the wide webbing D and narrow webbing E, arranged as and for the purposes herein set forth.

144,960.—Plow.—AMUND K. DAHL, Fox Lake, Wis. Application filed April 19, 1873.

The front half of the land-side, with the forward section of the moldboard and the point, are cast in one solid piece, to which the other parts are bolted by means of flanges, the standard extending downward only just past the top. The hinged guard clasps the standard, and is held down by a spring.

Claim.—1. The front part A, of a plow, with the part *c* of the mold-board, and the part *d* of the land-side, all made in a single solid piece, substantially as described.

2. The guard D, having its rear end slotted to engage on the standard *a*, in combination with the spring F, the construction and arrangement being substantially as shown and described.

144,961.—Cement Sewer-Bottom.—MARCELLUS DAY, Charlestown, Mass. Application filed October 2, 1873.

The sewer-bottom is formed in tubular sections of hydraulic cement and sand.

Claim.—The tubular sewer-bottom or section, formed to shape in a mold, of the material and by the process substantially as described.

144,962.—Fumigator.—ABRAHAM R. DENLINGER, Gordonville, Pa. Application filed August 30, 1873.

In the main tube the fumigating substance is placed, perforated and removable diaphragms being placed upon each end. A mouth-tube is attached to one end, and a nozzle to the other end.

Claim.—In combination with the cylinder A and conic tubes E F, the detachable rimmed or flanged and perforated diaphragms D C, locked or otherwise attached, when the whole jointly is constructed substantially in the manner and for the purpose described.

144,963.—Stock for Shoeing Animals.—JACOB DITCH, Five Forks, Pa. Application filed August 8, 1873.

The animal is led between two upright posts on each side. The platform is widened or narrowed by shifting the posts of one side with a portion of the floor by means of a pivoted lever and link lateral at each end. Confining end bars are applied adjustably. A shifting block fitting in mortises is used to hold the foot in shoeing. A pulley with a cord confines the animal's head.

Claim.—1. The bed composed of the slotted end pieces E E and longitudinal bar provided with cross-pieces B B, in combination with the posts I I I' I', connected by cross-bars, longitudinal movable bar D provided with mortises, and levers L L to open and close the stocks, substantially as described, and for the purpose set forth.

2. The stationary bed A, having the uprights I I, carrying a roller, in combination with the movable bed D H, provided with uprights I' I', carrying a roller, belt M, levers L L, and connecting-rods G G, as and for the purpose set forth.

3. The stocks made to open and close, as described, with the brackets N N, provided with holes, and bars or cross-pieces O O, having perforations and pins, by means of which the bars may be adjusted to animals of different heights, substantially as described.

4. The stocks made to open and close, as described, when provided with mortises P P, in combination with the shifting-block Q, by means of which either foot of the animal confined can be securely fastened for shoeing, substantially as described.

5. The stocks made to open and close, as set forth, when provided with a roller, R, having a cord or its equivalent, in combination with the mortises P P and shifting-block Q, as and for the purpose set forth.

144,964.—Nut-Lock.—CASPER DITTMAN, near Leacock Post Office, Pa., assignor to himself and DAVID N. LANDIS, Jr., same place. Application filed July 10, 1873.

A series of rubber balls are inserted in the chambered nut, and a follower provided, which enters the recess. The follower and nut are prevented from separating by slightly spreading the interior flange of the nut in the central hole of the follower.

Claim.—1. The combination of nut D, having flanges C R, and the rubber balls H, placed between said flanges and the washer F, substantially as and for the purpose described.

2. A nut and washer C D E F, held together by a portion of the nut being upset in the hole of the washer, as and for the purpose specified.

144,965.—Pump.—JOSEPH W. DOUGLAS, Middletown, Conn., assignor to W. & B. DOUGLAS, same place. Application filed September 2, 1873.

A brace is pivoted to an adjustable sleeve, which encircles the pump-barrel.

Claim.—The combination of the sleeve F, carrying the brace or standard G, with the pipe C of a pump, as specified.

144,966.—Dumping-Car.—JOHN ELLIOTT, JOHN P. HARRINGTON, and WILLIAM R. DAVENPORT, Erie, Pa., assignors to ERIE CAR-WORKS, same place. Application filed October 24, 1873.

Claim.—1. In combination with the transverse timbers A B of the truck-frame, the yoke *c*, hinged brake-hangers *d*, and brake-blocks C, as and for the purpose set forth.

2. The combination of the center bearers F F, side sills G G, center stringer E, and iron stirrups *f f*, as and for the purpose described and represented.

3. The combination of the rods *h h*, drops H H hinged thereto, and safety-straps *i i*, as and for the purpose described and represented.

4. The combination of the center stringer E, slotted as at *r r*, and the cheek-pieces N N for strengthening said stringer, and for facilitating the removal and replacing of the draw arrangement O, as described and represented.

144,967.—Stove-Pipe Stretcher, &c.—GEORGE ELSEY, Sterling, Ill. Allippcation filed May 24, 1873.

A casting of wedge shape skeleton form for inserting in the end of a stove-pipe for stretching the same, and so formed that it may be used as a boot-jack.

Claim.—A skeleton stove-pipe stretcher having the inclined bars A, curved bar B, shoulder-bars *a*, and handles C, with or without the brace-bars A' and lugs *b*, substantially as described.

144,968.—Center-Board for Vessels.—JOSEPH ESPALLA, Mobile, Ala. Application filed October 4, 1873.

Claim.—A center case, the forward end of which is wider than the after, provided with a center-board as constructed and pivoted that it will swing and swerve automatically, in the manner shown and described.

144,969.—Machine for Forging Hammers.—WILLIAM EVANS, Long Island City, N. Y. Application filed October 25, 1873.

Claim.—1. The arrangement and combination of the forming-dies, the punch, the shears, and the finishing-dies in a machine for making hammers, substantially as described, for the purposes specified.

2. The dies E^1 E^2, for the purpose of crowding out the metal and perfecting the contour of the hammer, substantially as described.

3. The method of making hammers from a steel blank by subjecting the blank, first, to the cutlining-dies; secondly, to the convex dies for indenting the cheeks; thirdly, to the punch; fourthly, to the shears; fifthly, sixthly, and seventhly, to the finishing-dies, substantially as described.

144,970.—Suspenders.—THOMAS JEFFERSON FLAGG, New York, N. Y. Application filed July 26, 1873.

Claim.—The suspender-end before described, consisting of the combination of the concealed core *c*, the cloth facing *c*, turned over the edge of the core, the button-hole lining *w*, projecting and concealing the edges of the cloth face and the core at the button-hole, and the backing *w*, covering and concealing the raw turned-in edge of the face, substantially as before set forth.

144,971.—Shutter-Hinge.—WILLIAM FOSKET, Meriden, Conn., assignor to CHARLES PARKER, same place. Application filed October 17, 1873.

A horizontal flange upon the lower side of the upper leaf falls behind and locks over another horizontal flange upon the upper edge of the lower leaf. The flange turns and projects at right angles to its plane for a short distance at its end. The larger part of the sides of the flanges are inclined, but small portions near the edges are perpendicular, to secure a more positive lock.

Claim.—1. The plate A, provided with the pintle B, the flange C, and the flange D, at right angles, or nearly so, to the flange C, combined with the plate E, provided with an elongated opening, F, for the pintle, and the flange G, substantially as and for the purpose described.

2. The plate A, provided with the pintle B, the flanges C and D, at right angles, or nearly so, to each other, combined with the plate E, elongated opening F, and flange G, when the said flanges C and G are constructed with a portion of their surfaces, *s w*, vertical, so as to form a dead lock, substantially as described.

144,972.—Clothes-Tongs.—ELIZA ANN FOULKE, Paris, Ill. Application filed September 15, 1873.

The arms are crossed and pivoted near the center of the length. The jaws have flat edges with concave inner spaces with holes for the escape of water.

Claim.—A pair of tongs the jaws C whereof have flat biting-edges *c* and intervening spaces or gutter-grooves *a*, provided with outlet-perforations *b*, as and for the purpose described.

144,973.—Safety Appliance for Governors.—JOHN GASKELL, Bridgeport, assignor to THE COLT'S PATENT FIRE-ARMS MANUFACTURING COMPANY, Hartford, Conn. Application filed May 26, 1873.

Claim.—In combination with a governor and the belt which drives it, a feeler provided with means of pressure, to bear said feeler upon the belt, and a stop in connection with said feeler, and in position relatively to the governor, constructed and operating substantially as described, so that, upon the breaking or loosening of the belt, the said stop will catch and hold the valve-moving portion of the governor in substantially the position it occupies when such breaking or loosening occurs.

144,974.—Needle-Threader.—FELIX R. GASPARY, Berlin, Prussia. Application filed May 28, 1873.

The corrugated portion of the elastic arm is adapted to embrace the needle and insure the entrance of the hook into the eye; and when the thread is caught the arm, in resuming its natural position, draws the thread through the eye.

Claim.—1. The arm D, pivoted to the clamping device B, made elastic, and provided at its lower end with the hook *h*, and with the notch or corrugation *s* at its point of contact with the needle, substantially as and for the purpose specified.

2. In combination with the elastic arm D, constructed as described, and provided with the hook *h*, the shield D, extending from the clamping device, and so as to receive the said elastic arm D, substantially as set forth.

144,975.—Elastic Anti-Friction Attachment for Vessels' Booms.—HARMON GREGORY, Jr., Rockland, Me. Application filed October 20, 1873.

Claim.—The combination, with the boom C, carrying the ring A provided with an annular groove, of a friction band or strap, D, the free ends E E of which serve as a socket for the springs L L, the whole being constructed and operating to form an anti-friction and elastic attachment, substantially as set forth.

144,976.—Letter-Box.—BENJAMIN B. GURLEY, Minneapolis, Minn. Application filed April 26, 1873.

A letter-box having two compartments, one on each side of the door, has an aperture, lid, and a door on each side. A letter dropped through the aperture on one side falls through an opening in the door into the receptacle on the opposite side. Raising the lid on the inner side, to drop a letter into the outer compartment, operates a crank, lifting a signal, which is held in an elevated position, by a catch on the outer lid until the lid is raised to release it.

Claim.—1. The boxes A and B, having letter-openings, combined with the door C, with its single opening *d'*, as and for the purposes set forth.

2. The lid *b'* of the inner box, rod *m*, crank-shaft E, and indicator G, connected and operated as and for the purpose set forth.

3. The lid D, arm *n*, and spring *k*, in combination with the crank E, as and for the purpose set forth.

4. The combination, with a door, C, of an outer and inner letter-box, A B, having letter openings and doors D D', and an inner lid, *b'*, operating an exterior indicator, G, all substantially as set forth.

144,977.—Lifting-Jack.—JOHN T. HAMILTON, Boone county, and EZRA F. CONNER, Decatur, Ind.; said CONNER assignor to said HAMILTON. Application filed September 24, 1873.

Improvement on patent of J. T. HAMILTON, March 19, 1872. The rod with which the rack-bar engages is secured between the standards.

Claim.—In a lifting-jack, the combination of the lever B, rod D, the ends of which are secured to the sides of the legs A A, and the rack-bar C, all substantially as and for the purposes set forth.

144,978.—Circular Harrow.—GEORGE W. HILLS, Dodge Centre, Minn. Application filed October 3, 1873.

A revolving harrow having a cam-shaped block in the center, to which the draft-beam is attached by a swivel-bolt. To the beam are secured rollers, one of which revolves on the upper surface of the cam-wheel, while another revolves on its periphery, and bears against the depressed portions, so that, when the harrow comes in contact with an obstruction, causing it to revolve, the roller is caused to move past a rounded corner, and onto another depressed side. A roller on the rear end of the draft-bar revolves against the outer rim of the frame.

Claim.—1. The combination, with a circular revolving harrow, A B, of the irregular cam-shaped center-block D, swivel-bolt *d*, draft-bar E, and draft-wheel G, as and for the purposes herein set forth.

2. The combination of the harrow-frame A B C, cam-shaped block D, beam E, swivel-bolt *d*, and rollers G G^1 G^2, all constructed substantially as and for the purposes herein set forth.

144,979.—Apparatus for Printing upon and Decorating Enameled Surfaces.—SAMUEL J. HODGSON, New Haven, Conn., assignor to THE AMERICAN ENAMEL DECORATING COMPANY, same place. Application filed September 16, 1873.

Claim.—1. In combination with the revolving table A and the post D, the arm I supported from the said post, and carrying the printing-disk M and the coating-roll U, substantially as set forth.

2. In combination with the printing-disk M supported from the post D, the block E, to which the disk is attached, and made adjustable vertically and axially, substantially as described.

3. In combination with the printing-disk N, the post D, and the block E supporting the disk, the cylindrical bar G to which the disk is hung, and made adjustable in said block, substantially as described.

4. In combination with the printing-disk N, hung to or supported from the post D by the arm I, the weight W, pivoted to said arm, for the purpose of adjusting the pressure of the said disk, substantially as described.

5. In combination with the printing-disk N, supported from the post D, and the coating-roll U, the auxiliary arm P, attached to and made adjustable upon the arm I, substantially as and for the purpose described.

144,980.—Grain-Scourer.—CHACE B. HORTON, Waterloo, N. Y. Application filed April 5, 1873.

Rubbers in convex sections attached to a cylinder revolving within another cylinder. Sections provided with sockets in which

may be secured any desired kind of brushing-surface, on each side of which are metallic rasping-surfaces.

Claim.—1. The tangential rubber for grain-scouring cylinders, constructed with a front end, 1, adapted to force the grain into contact with the case, and with a socket, 3, to hold a brush, 4, or its equivalent, and to protect the edges thereof, substantially as herein described.

2. A tangential rubber for grain-scouring cylinders, having metallic rasping-surfaces 1 2 at its respective ends, and an intermediate changeable brushing or rubbing surface, 4, formed and operating substantially as herein set forth.

3. A tangential rubber for grain-scouring cylinders, having a wooden rubbing-block, 4^b 4^c, held in a socket, 3, and constructed with an effective surface formed by saw-kerfs, substantially as specified.

144,981.—Steam Radiator.—ALBERT L. IDE, Springfield, Mass. Application filed June 6, 1873.

Each tube of the radiator is provided with three passages, two of which are intended for the upward and the third for the downward passage of steam.

Claim.—In a steam radiator, a vertical pipe or column divided interiorly into three vertical passages, substantially as and for the purpose specified.

144,982.—Hand-Power Baling-Press.—PLATT C. INGERSOLL, Green Point, N. Y. Application filed August 4, 1873.

Claim.—1. The pulley G for guiding the chain L, in combination with the pulleys C D I, for operating the follower B of a press, substantially as described.

2. The differential pulleys C D and ratchet and pawl E K, in combination with the pulley I, guide-pulley G, and follower B, substantially as and for the purpose described.

144,983.—Sulky.—LA FAYETTE H. JENNISON, Monroeville, Ohio. Application filed October 24, 1873.

Claim.—1. The U-shaped springs G, in combination with the thills A A and axle-tree E, substantially as and for the purpose set forth.

2. The spring-brackets F, in combination with the thills A A and axle-tree E, as and for the purpose set forth.

3. The trotting-sulky consisting, essentially, of the thills A A, U-springs G G, spring-brackets F, and axle-tree E, all constructed and arranged in the manner as described, and for the purpose set forth.

144,984.—Bed-Spring.—WILLIAM W. JONES, Philadelphia, Pa. Application filed May 14, 1873.

Two coupled spiral springs are surmounted by independent loops for the reception of the slats, the springs, loops, and coupling constructed of one piece of wire.

Claim.—A compound bed-spring, consisting of two coupled spirals, A and B, composed of a single piece of wire, and each surmounted by an independent loop, *b*, for the reception of a slat, all as and for the purpose specified.

144,985.—Measuring Device for Spooling-Machines.—THOMAS K. KEITH, Haverhill, and AUGUSTUS SHAVER, Milford, Mass. Application filed July 10, 1873.

The spool draws the thread through open loops on the face of a loose worm-wheel, thereby turning said wheel, which engages with a toothed worm rotating at a right angle to it, which in turn engages with a graduated toothed wheel rigidly attached to the shaft, which serves as a bobbin-spindle, and arranged side by side with the first-mentioned loose worm-wheel.

Claim.—The combination, with the screw-wheel *f* and gear-wheel *l*, of the toothed and screw wheel *r* engaging with both these parts, being arranged and operating substantially as described.

144,986.—Blacksmith's Forge.—WARREN T. KELLOGG, Troy, N. Y. Application filed June 20, 1873.

The blast-fan is operated by means of a hand-lever and frictional gearing, with journal-boxes adjustable in slots by means of springs.

Claim.—The combination, substantially as shown and described, in a portable forge, of a blast-fan and system of friction-pulleys and adjustable journal-boxes and springs for constantly maintaining the contact of the faces of the pulleys, all arranged below the plane of the fire-pan and operated by a lever, in the manner set forth.

144,987.—Apparatus for Preserving and Forcing Beer.—EDWARD C. KRAUSNICK, St. Louis, Mo. Application filed April 28, 1873.

Gas conveyed from a generator through a tube expels air from a liquid-receiving chamber placed within the temperator, which is afterward filled with liquid from a reservoir. The vacated space in the reservoir is filled with gas from the generator. The liquid-chamber is surrounded by hot or cold water, as warm or cold liquid is desired. An extra cold-chamber, as well as a siphon containing mercury for determining the pressure of the gas, is placed on the generator.

Claim.—1. The generator A, the temperator B, and the reservoir D, constructed, connected, and combined substantially as and for the purpose described.

2. The chambers *c* and *e*, combined with a pipe, *d*, arranged as and for the purpose described.

3. The siphon *l* for regulating, increasing, or diminishing the pressure of the gas generated by increasing and diminishing the quantity of mercury, applied to serve also as a safety-valve, being of such dimensions that all the gas possibly generated by neglecting the closing of faucet *p* can escape through said siphon *l*.

4. The washers *g* and *f*, so arranged that the generated gas is prevented from passing directly through the washing liquid by the horizontal plates h^1 h^2 h^3 h^4, as and for the purpose described.

5. The generator A, so constructed that, in a few rare cases, when the use of carbonic acid is injurious to the liquid to be preserved, the hydrogen gas may be generated for the same purpose, to form an indifferent atmosphere.

6. The extra acid-vessel *y* on generator A, applied as described, whereby the generator may be supplied with fresh acid by filling said vessel with water and adding a few pieces of carbonate of lime, and the operator may keep the generator for a longer time at work without giving a new charge.

7. The faucet F, constructed and applied as described, so that the generated gas can enter the reservoir or barrel D, the preserved liquid can pass through this faucet out of reservoir D into vessel b^3 of the temperator, and, further, can pass from vessel b^3 into the outlet-chamber of said faucet, without coming into contact with the atmospheric air, or without reducing the original pressure, till drawn off for use.

8. The temperator B, constructed and applied as described, so arranged that it may be used as a refrigerator or a coloridicator, being founded on the laws of specific gravity of fluids of different temperatures, without altering the pressure.

9. The reservoir D and vessel b^3, combined with pipes b^4 b^5 and faucet F, as and for the purpose set forth.

10. The pipe *q* and faucet *p* on generator A, combined as described, so that the pressure of the generated gas may be increased at will of the operator.

11. The combination of pipe β^2 and its connections with cistern b^3 of the temperator B, the pipe β^1, and surrounding pipe β^3, as described, so that the temperature of the water of cistern b^3 can be regulated and kept uniform, as the liquid to be preserved may require.

144,988.—Middlings-Purifier.—EDMUND M. LACROIX, Minneapolis, Minn. Application filed November 22, 1873.

By the reciprocating or vibrating and rising-and-falling motions imparted to the annular sieve, the material to be acted upon travels in the path of a circle from the head to the tail. The air-pipe underneath the sieve, as constructed, admits of a double blast being thrown upon it.

Claim.—1. An annular sieve constructed and operated as described, the material to be acted upon traveling over the same in the path of a circle from head to tail.

2. The combination, with an annular sieve, constructed as described, of mechanism for imparting a reciprocating or vibrating motion to the same, substantially as and for the purpose described.

3. The combination, with an annular reciprocating or vibrating sieve, of mechanism for imparting a rising-and-falling motion to the same, substantially as and for the purposes described.

4. The combination, with an annular reciprocating or vibrating sieve, of an automatic cleaning device underneath the same for keeping the meshes of the cloth clear.

5. The combination, with a sieve or shaker, of mechanism for imparting a reciprocating rotary motion to the devices for cleaning the meshes of the cloth.

6. The combination, with an annular reciprocating or vibrating sieve, of a suction-blast, substantially as and for the purposes described.

7. The combination, with an annular reciprocating or vibrating sieve, of an air-blast underneath the same, substantially as and for the purpose described.

8. The air pipe or pipes D', constructed with diagonal openings, with or without slides *d'*, substantially as and for the purpose specified.

9. The combination, with the chamber B and annular sieve F', of the flexible ring or head U, for the purpose specified.

10. The combination, with an annular reciprocating sieve, of discharge-spout R and flexible connections *r*, substantially as and for the purpose described.

144,989.—Corn-Planter.—JAMES G. LA FORTE, Dayton, Ohio. Application filed October 23, 1873.

The frame of the machine is mounted upon five wheels, three of which follow after the furrow-openers and droppers to cover the seed. The forward wheels vibrate upon a king-bolt, as in the common four-wheel vehicle, and change direction in turning at the end of the field, but when passing straight forward become fixed by lock-bars. The middle covering-wheel is placed in rear of the others, and has upon one side cams to operate the seed-slide. Row-markers are formed by cut-rigging in the usual manner.

Claim.—1. The combination of the hoppers D D', spring-slide G, reversible lever H, and follower F provided with several series of inclines, *b*, with the adjustable followers *c* and drill-teeth *f*, for the purpose of planting corn in rows and hills at varying distances apart, substantially as described.

2. The combination of the self-adjusting follower-shaft *d* with the arms *l l* and drill-teeth, as and for the purpose shown and described.

3. The brakes or stays K K, for holding the front axle rigidly in line with the frame-work of the machine, substantially as set forth.

144,990.—Drain-Tile.—JOHN LEVELER, Rochester, N. Y. Application filed October 17, 1873.

A pipe-mold made in sections, its ends having offsets and intermediate sockets to form pipes, having alternate corresponding projections and depressions on their edges, so as to interlock with each other.

Claim.—1. The rectangular mold herein described, consisting of the sides A A, bottom B, and ends C C, and provided with the offsets *c c* and *d d*, as and for the purpose specified.

2. The pipe constructed with square bottom and sides and an angular top, and provided with the intermatching coupling projections *f f* and sockets *g g*, as and for the purpose specified.

144,991.—Automatic Fire-Alarm.—CHARLES H. LESCHORN, Philadelphia, Pa., assignor of one-half his right to ALEXANDER LESCHORN, Pittsburg, Pa. Application filed May 10, 1873.

One or more U-shaped tubes or vessels containing mercury, and having one arm in connection with a closed and exhausted fusible tube extending to the locality to be guarded, are arranged with a piston on the other side, carrying an indicating-disk, and in connection with the trip or detent of an alarm mechanism, so that in case of fire the tube collapsing allows the mercury, acted on by atmospheric pressure, to raise the piston, and thus sound an alarm, at the same time that the indicator being brought into view announces the locality of the fire.

Claim.—1. The combination of a clock-alarm cam-wheel, L, a lever, J, piston-rod *a*, indicator-plate F, and piston E, with the cylinders A B communicating at *c*, and being partly filled with mercury, and the fusible vacuum-pipe D, substantially as specified.

2. The combination of a fusible vacuum-pipe, a piston, and a communicating pair of cylinders or pipes charged with mercury or any other liquid, for the purpose of indicating, by the change of elevation of such liquid in either part of the said cylinders or pipes, the action of fire on the fusible vacuum-pipe, substantially as specified.

144,992.—Machine for Tenoning Cogs.—STEPHEN W. LONG, Owensborough, Ky., assignor to himself and THOMAS H. GUTHRIE, same place. Application filed July 26, 1873.

The several forms required by wooden cogs are given by means of the carriage and adjustable guides and ways.

Claim.—In combination with the rotary cutter-head E *e e'*, the pivoted and grooved ways *b b'* F *f f'*, reciprocating carriage H H^1 A A^1 k^2 k^1 I *i*, adjustable table J *j*, rock-shaft K, clamp M *n* O, and set-screws L, L^1, R, and S, as and for the purpose specified.

144,993.—Apparatus for Refining and Deslivering Lead.—GUSTAVE LUCE, Marseilles, France, assignor to LUCE, SON & ROZAN, same place. Application filed November 16, 1872.

Injects steam into the bottom of the vat which contains the melted mass, agitating the mass, causing the lead to crystallize, and oxidizing the foreign metal.

Claim.—The combination of the melting-caldron H, the crystallizing-vat A arranged to receive the melted lead from the caldron, the steam-pipe B extending to the bottom of the vat and provided with the cock C, and the operating-rod E, the said vat provided with the spout or spouts E', all substantially as and for the purpose specified.

144,994.—Farm-Gate.—WILLIAM LUCUS, Olive Green, Ohio. Application filed October 4, 1873.

The gate is supported centrally on a vertical post which extends up through a slotted cross-beam, and rests its lower end in a step in the ground-sill. Rollers are attached above the cross-beam to the upper end of said post, on which, after the gate is turned half-way around, the gate is rolled along the cross-beam to one side of the roadway. A long latch-bar holds the gate to the side posts when shut.

Claim.—The horizontally-turning gate D, suspended from an overhead beam, C, by means of rollers *d d*, in combination with the slot *a*, substantially as and for the purposes described.

144,995.—Crimping Apparatus for Boots, &c.—MARTIN R. MARCELL, Dansville, N. Y., assignor of one-half his right to WARREN H. CASE, same place. Application filed April 23, 1873.

Rollers are inserted in the inner surfaces of the jaws, slightly projecting, so that the crimping-block, as it is forced between the jaws, will bring the leather into immediate contact with the rollers.

Claim.—1. In an apparatus for crimping leather, the combination of the rollers G G with the jaws E E, or equivalent, when said rollers are set in the inner faces of the jaws, and project therefrom to receive the contact of the crimping-block, substantially as and for the purpose specified.

2. In combination with the jaws E E and rollers G G, the encircling-straps H H, as and for the purpose specified.

144,996.—Valve.—ANSELM MARMONT, St. Louis, Mo., assignor to JOSEPH W. BRANCH, same place. Application filed October 7, 1873.

The valve-seat is made cylindrical in form, and is cemented in place against a circumferential flange in the valve-chamber. On the valve-seat the valve proper is hinged. On the back of said valve a projection, having a slotted cylindrical socket, affords the means of operating the valve by the spherical head attached to the valve-stem.

Claim.—1. The valve-seat *a*, formed with a circumferential flange, *m*, which abuts against an inside flange, *n*, of the valve-chamber *c*, and with lugs *d* for attachment of the axial valve *e*, substantially as and for the purpose set forth.

2. The axial valve *e*, formed with a lug, *j*, having a cylindrical socket, *i*, and slot *k*, and jointed to the valve-seat *a*, in combination with the operating screw *f* having a spherical head, *h*, as set forth, and for the purpose described.

3. The combination of the valve-chamber *c*, necks *b b'*, valve *e*, socket-lug *j i*, valve-seat *a d*, and screw *f* having a head, *h*, and passing through a stuffing-box, all substantially as set forth.

144,997.—Hose-Coupling.—THOMAS J. MAYALL, Boston, Mass. Application filed October 9, 1873.

A divided hinged coupling-ring closes around collars formed upon the contiguous ends of the hose-sections, and is securely fastened by a locking device consisting of a pivoted locking-lever and a swival cross-pin applied to the respective ends of the coupling-ring.

Claim.—1. In combination with the divided and hinged coupling-ring, the locking-lever and swiveled and adjustable locking-pin, said parts being applied to the respective ends of the coupling-ring, and constructed and arranged for joint operation, substantially as shown and set forth.

2. The coupling collars, having their exterior opposite sides inclined or beveled, and provided with packing-rings on their contiguous faces, in combination with the divided and hinged coupling-ring, locking-lever, and swiveled locking-pin, said parts being constructed and arranged for joint operation, substantially as described.

144,998.—Apparatus for Mixing Vulcanizable Compounds of Rubber, &c.—THOMAS J. MAYALL, Boston, Mass. Application filed October 29, 1873.

The radial inclined blades lift and mix the mass, overcoming the tendency of the sulphur, emery, and other heavy matters to collect at the bottom of the mixer. The stock is squeezed and mashed between the projecting arms and mixing-blades.

Claim.—The combination, with the mixing-tank and the upright rotary shaft therein, of the radial inclined blade carried by said shaft, and the stationary arms projecting inwardly from the sides of the tank, and operating, in conjunction with said revolving radial inclined blades, substantially as shown and set forth.

144,999.—Paper-Hanger's Brush.—JOHN M. MCCOMB, Lancaster, Ohio. Application filed August 22, 1873.

Claim.—1. The hinged spring-pressed clamp C, applied to the top of a paper-hanger's brush, as and for the purpose described.

2. The combination, with clamp C, of lifter E, having stud *e*, with cord or wire extending along the handle, as and for the purpose set forth.

3. The combination, with a lifter having the extension *e'*, of the crooked lever G, hook *g*, fulcrumed at H H, and an end, *g'*, extending below the handle, as and for the purpose specified.

145,000.—Means for Operating Screw-Propellers.—ALEXANDER MCDONALD, Cumberland, Md. Application filed October 27, 1873.

The pinion *a* is attached to the lower end of shaft *b*, to the upper end of which is attached a hand-wheel, L, said shaft being mounted on a rocking bar, J, which allows the pinion to be thrown into and out of gear with the wheel I, the whole being designed to afford means for assisting the machinery in passing the dead-center, or for starting it when it has stopped on that point.

Claim.—1. In connection with a propeller-shaft, the combination of the gear I and pinion *a*, having a hand-wheel connected therewith, and having bearings in a rocking bar, as and for the purposes set forth.

2. In combination with the blades D D', the shaft and sleeve A A', and gears, as set forth, the gear I, pinion *a*, hand-wheel L, and rocking shaft, all substantially as and for the purposes set forth.

145,001.—Saddle.—THOMAS H. MCGRATH, San Antonio, Tex. Application filed September 13, 1873.

Claim.—1. The metallic cap C, having flanges *c* and extension *c'* applied to horn of saddle-tree, as and for the purpose described.

2. The grooved part-collar E, applied under the front of the horn of a saddle, as and for the purpose set forth.

145,002.—Medical Compound.—GEORGE F. MUNRO, Leon, Iowa. Application filed May 13, 1873.

One part of cinconia, one part of sanguinaria, one-fourth part of niter, two parts of sulphur, one-eighth part of leptandria and podophyllin, one-eighth part of bromide of potassium and morphia, and "Tilden's" extracts in such proportions as the malady of the patient may require.

Claim.—The medical compound herein described, composed of the ingredients, compounded in the manner and proportions, substantially as specified.

145,003.—Barrel-Washer.—ADOLPH MUNTZENBERGER, Kenosha, Wis. Application filed June 26, 1873.

The barrels, partially filled with water, are placed upon a rack suspended between standards so as to enable it to swing longitudinally, and agitate the water and cause it to be thrown around the entire surface of each barrel.

Claim.—The hereinbefore-described device for washing barrels, consisting of a rack suspended so as to swing longitudinally, and suitable mechanism for causing said rack to reciprocate, substantially as and for the purpose specified.

145,004.—Car-Axle Box.—DAVID MUNSON, St. Albans, Vt. Application filed April 3, 1873.

The jaws of the pedestal have concave interior surfaces, while the sides of the axle-box are globe-shaped, this construction allowing the axle-box to adjust itself within the jaws.

Claim.—The hanger B provided with concave sides, as shown and described, in combination with the globe-shaped box C, for the purposes herein set forth.

145,005.—Manufacture of Steel.—CHARLES M. NES, York, Pa. Application filed November 21, 1873.

Claim.—The manufacture of steel from silicon pig-iron, either separately, or in combination with ordinary pig or cast iron, substantially as described.

145,006.—Safety-Strap for Harness.—CLARENCE W. NICHOLS, Chicago, Ill., assignor to HENRY H. FEARY, same place. Application filed September 10, 1873.

Claim.—1. The strap D, combined with the cross-strap B, and forming therewith a safety-triangle, as and for the purposes described.

2. The combination and arrangement of the loops, rings, or eyes *a*, *a*, *b*, and *c* with the straps B D, as and for the purposes described.

145,007.—Earth-Boring Machine.—SILAS R. OWEN, Stewartville, Mo. Application filed April 19, 1873.

The boring is effected by connecting the sweep to the auger-shaft through the attachment L. The weight of the auger and shaft feeds the same downward, the shaft being extensible, and at the same time draws the rope *c* from the windlass D. When the auger is to be raised the sweep is disconnected from the auger-shaft, which is then prevented from rotation by the bolt P', and connection is effected between the sweep and the capstan H by a drop-hook and catch. The sweep is then rotated, and the capstan takes up the rope from the drum E, geared with the winding-drum, which takes up the hoisting-rope to which the bucket is attached. The sweep is attached to a ring which rotates freely within the capstan. The rope which suspends the auger-shaft is prevented from twisting when the auger is rotated by a swivel connection at lower end, and by passing through a tubular swivel which sustains the auger-shaft case at the upper and.

Claim.—1. The combination of ropes C and G with pulley B, swivel U, windlasses D and E, wheels *d*, *e e'*, and *f*, crank F, and capstan H, substantially as specified.

2. The combination of sweep K, levers L L, adjustable bar M, ring J, drop-hook *h'*, and catch *h*, substantially as specified.

3. The combination of bars N O, box P, bolt *p'*, and swivel-eye *p*, substantially as specified.

145,008.—Fog-Signal.—GURNEY C. PATTISON, Baltimore, Md. Application filed July 2, 1873.

A floating body, with a vertical opening through its middle, in which is hung a paddle-wheel, is supported at its ends upon fixed upright poles, and carries a bell, suspended over the paddle-wheel, in such manner as to be tripped or swung by the same as the wheel is turned by the waves.

Claim.—The combination of the boat A with wheel E and bell F and the bars B B, connected to the boat and to the standards C C, all substantially as and for the purposes set forth.

145,009.—Spindle for Spinning-Machines.—WILLIAM G. PERRY, Manchester, N. H. Application filed July 21, 1873.

The cap receives the lower end of the bobbin, causing it to turn with the whirl, which latter has also a flange projecting over the upper end of the bolster, protecting it from dust, &c., and a pin entering a circumferential groove in the bolster to prevent the whirl being raised in doffing, the neck of the whirl steadying its rotation.

Claim.—The whirl B, having the cup U, flange J, neck H, and pin S, in combination with the bolster E, having screw-step N, and groove Y T, and the spindle, as and for the purpose specified.

145,010.—Apparatus for Drying Tan.—NATHANIEL PORTER, Peabody, Mass. Application filed September 4, 1873.

Claim.—The stationary solid floors A, arranged as herein described, in combination with the reciprocating scrapers, links *a b*, and shaft *c*, all constructed and arranged substantially as described, for the purpose specified.

145,011.—Sewing-Machine Caster.—JAMES K. PROCTOR, Malden, Mass. Application filed November 1, 1873.

The casters may be lifted from the floor by a lever.

Claim.—The caster-frame D, herein described, the same consisting of the two bars *a*, each carrying two caster-wheels, *b*, and the connecting-rod *d*, which bars *a*, together with the rods *d*, are hung to the standards C and connecting-rod F, and actuated by the treadle-lever G, or its equivalent, substantially as herein described, for the purpose specified.

145,012.—Planing-Machine.—JOHN RANKIN, Binghamton, N. Y. Application filed December 3, 1872.

The planing cylinder is driven by a system of gearing that imparts power equally upon opposite sides of the cylinder-shaft.

Claim.—In combination with the supporting-frame and work-bed, and the cutter-shaft with its driving mechanism, the yielding feed-roll and its driving-gears, the whole arranged to operate substantially as and for the purposes described.

145,013.—Railway-Switch.—THOMAS J. REYNOLDS, Irvington, Ill. Application filed November 5, 1873.

A switch of that class wherein a spring is interposed between the shifting-lever and the movable point-rail, to allow the flange of the wheel to pass should the point be improperly set. The opposite point in this case is fixed, and secured to the main rail by bolts passing through offsets, which hold it at the proper distance from the main rail. The said point is fixed in a block, E, upon which the flange of the wheel runs in making the transit from the point to the main rail, or vice versa.

Claim.—1. The combination of the rails C B, rod F, spring G, and target-rod H with the rails A D and piece E, as and for the purpose set forth.

2. The combination of the piece E with the rails A D and lugs *b b b*, as and for the purpose set forth.

145,014.—Brace-Truss.—HENRY H. ROEDEL, Lebanon, Pa. Application filed July 29, 1873.

At each of the four corners where the iron frames of the brace meet is placed an angle-iron, upon each arm of which the frame is adjusted. Four adjustments are thus furnished, so that the abdominal portion of the brace may be drawn up as well as shortened to meet the varying form of the abdomen.

Claim.—The side springs, connected to the front and back bars by the solid angles adjustably connected thereto.

145,015.—Railway-Rail Fastening.—ALBION M. ROUSE, St. Louis, Mo. Application filed May 19, 1873.

The clamping-jaws have wedge-formed sole-plates so arranged that when drawn together the base of the rail is constricted both laterally and vertically. The lower flange of one is pierced for the passage of lugs on the other, through which elastic wedges of U form are driven. These are secured in place by a locking-strip.

Claim.—1. The combination of the jaws B E when provided with wedge-formed sole-plates C F, arranged and operating substantially as and for the purpose set forth.

2. In combination with the jaws B E, the slotted lugs D and slotted rib or flange *e'* for securing the jaws together, substantially as set forth.

3. The elastic wedge G *g*, arranged substantially as set forth.

4. The combination of jaws B E, lugs D, wedge G, and locking-strip H, substantially as and for the purpose set forth.

145,016.—Harrow.—LEVI C. RUMBERGER, Cass, Pa. Application filed May 24, 1873.

Securing harrow-teeth to beams by means of eyelets or round sockets provided with square holes, which are set into beams, and are prevented from passing through by means of flanges on the upper ends. The teeth are passed into the eyelets or round sockets, and are secured by means of wedges.

Claim.—In a harrow, the cylindrical eyelet A with the flange *a*, the diametrically-opposite holes *a'*, the square hole B, and the key-groove *b*, substantially as specified.

145,017.—Machine for Making Heel-Stiffeners.—JAMES SAMUELS, Vineland, N. J., assignor to WILLIAM G. HILL, Cambridge, and L. B. RUSSELL, Lynn, Mass. Application filed February 17, 1873.

Claim.—The former A, the fluted clamp C, and the crimper E, arranged, constructed, combined together, and provided with operative mechanism, all substantially as described.

145,018.—Broadcast Seeder.—JAMES B. SCARBOROUGH, Millburn, Ky. Application filed July 12, 1873.

Claim.—In a broadcast seeder, the scatterer G, constructed with two concave disks of equal size, arranged one above the other, and separated by the radiating angular partition-plates *a*, their inner acute angles meeting the margin of the opening in the upper disk, substantially as shown and described.

145,019.—Seeding-Machine.—MORRIS SCHNAPP, Pleasant Park, Mo. Application filed March 15, 1873.

The frame consists of a beam, share-standards, and handles. The seed-box is adjustably secured to the forward standard and provided with a feed-roller at the lower end, and rotated by a band from a pulley on the covering-wheel. The covering-wheel is adjustably attached to the rear end of the beam, thus affording means for tightening the band and regulating the depth of the machine.

Claim.—The standards B B', clod-fenders J J, seed-box E, clamps G G', wheels H I, bar K, pulley *f*, and belt *e*, all constructed, combined, and arranged as and for the purpose set forth.

145,020.—Photographic Plate-Holder.—AUGUST SEMMENDINGER, Fort Lee, N. J. Application filed September 4, 1873.

Claim.—The supports a bent up of wire, and provided each with two recesses, *b b'*, and with retaining-spurs *c*, in combination with a photographic plate-holder, A, substantially as and for the purpose herein set forth.

145,021.—Manufacture of Gas.—HENRY SKOHNS, London, assignor to WALTER SANDELL MAPPIN, Stanley Crescent, England. Application filed October 8, 1873.

Claim.—1. The process of treating the crude gases, vapors, or products arising from the coking or first carbonization of cannel-coal and analogous substances, by introducing such products, with superheated or other steam, or with water, into retorts or chambers charged with chalk or analogous material in a highly-heated state, as above described.

2. The above-described process of manufacturing or producing gas for illuminating or heating purposes by coking or carbonizing cannel-coal or analogous substances in coking retorts or chambers, treating the resulting gases, vapors, or rising products with superheated or other steam, or with water, in other or intermediate retorts or chambers containing chalk or analogous material for absorbing the sulphurous compounds and ammonia, and amalgamating the gases in final retorts or chambers charged with coke or analogous substance.

3. The process of manufacturing or producing gas by passing air or superheated or other steam through a retort or chamber charged with highly-heated chalk or analogous material, thence through a retort or chamber charged with highly-heated coke or analogous substance, and afterward through a highly-heated retort charged with cannel-coal or analogous substance, as above explained.

145,022.—Smoke-Consuming Apparatus.—WILLIAM RAE WILSON SMITH, Glasgow, North Britain. Application filed November 7, 1873.

Tubes are formed by longitudinal grooves in the side of the grate-bars, through which hot air and superheated steam are supplied to a horizontal pipe above the fire and into a hollow bridge-wall, through which they are emitted and commingle with the smoke.

Claim.—1. A smoke-consuming apparatus in which hollow grate-bars A, air or steam tubes B, and a hollow bridge, D, having outlet-openings *b*, are combined and applied to a fire-box or furnace, substantially as herein described.

2. The air or steam passages *a*, formed between adjoining grate-bars by longitudinal grooves in the edges of the same, as set forth.

145,023.—Bed-Bottom.—CHARLES B. SPENCER, Hastings, Minn. Application filed May 1, 1873.

A frame has near each end a lateral strap fastened to posts on its sides. Along these straps are affixed sections of round rods, each split longitudinally. Around each is coiled the middle of a wire-spring, the extended ends of which are attached, one to the slats above and the other to the frame below.

Claim.—The jointed rods E 3, in combination with the springs D and slats C, substantially as shown and described.

145,024.—Machinery for Making Wood Shanks for Boots and Shoes.—WATSON N. SPRAGUE, Keene, N. H., assignor to himself, and GEORGE GOODYEAR, Elizabeth, N. J. Application filed October 2, 1873.

A revolving disk is provided with a series of knives set at different distances from its face, which split the wooden shank into layers, which are all united at one end.

Claim.—1. In machinery for cutting and splitting shanks for boots and shoes, the combination of a rotary cutter-holding disk, a series of cutters set at different distances from the face of said disk, so as to make their cuts in different planes, and thus form the leaves of the shank, and a guide for supporting the stock to be operated on, so that said stock may be fed in proper position in the path of said cutters, said parts being arranged and operated substantially as shown and described.

2. The combination of the cutter-holding disk, the slitting-cutters, the separating-cutter, and the guide or support for the wood or other stock to be operated on, substantially as and for the purpose shown and set forth.

3. The cutter-holding disk provided with a circular boss or central projection, and the slitting and separating cutters arranged on said disk, as described, in combination with the guide having a ledge or shoulder, between which and the shoulder formed by the boss the stock may be pressed and held against the face of the disk in the path of said cutters, as shown and set forth.

4. The combination of the slitting and separating cutters with the cutter-holding disk, constructed in rear of the slitting-cutters with clearing-spaces, progressively increasing in size to accommodate the increasing thickness of shank, and a discharge opening or outlet in rear of the separating-cutter, substantially as shown and set forth.

145,025.—Sewing-Machine.—ONÉSIME ST. AMANT, Quebec, Canada, assignor of one-half his right to JOSEPH WOODLEY, same place. Application filed October 28, 1873.

A series of levers connected with the presser and operated by a pattern-cam, operate such foot to move the material in any desired direction.

Claim.—1. The combination, in a sewing mechanism of otherwise ordinary or suitable construction, of a feed capable of universal movement, and a pattern wheel or cam, and intermediate mechanism connecting said pattern and feed, constructed and operating substantially as shown and described, to cause said feed to automatically carry the work during the progress of the sewing backward as well as forward, to either side or in any direction, substantially as and for the purpose set forth.

2. In combination with the presser-foot *v*, having an intermittent rise and fall, as described, the wheel c^1, provided on its lateral faces with projections, indentations, and plane surfaces, as described, and the system of levers communicating movement from said wheel to said presser-foot, all substantially as herein shown and set forth.

3. The wheel c^1, in combination with the levers g^1 and l^1, link q^1, and spiral springs m^1 and o^1, for actuating the presser-foot *v*, substantially as described.

4. The wheel c^1, in combination with lever r', slide r, bell-crank lever u', and rod w', caused to move as described, and actuating the presser-foot *v*, as and for the purposes described.

5. The wheel c^1, having projections, indentations, and plane surfaces, in combination with pinion k^1, as described.

6. The rod *u* with presser-foot *v*, in combination with stud *s*, pivot-pin *t*, yoke *w*, and spring *x*, substantially as set forth.

145,026.—Saw-Mill Dog.—EDWARD H. STEARNS, Erie, Pa. Application filed July 3, 1873.

A series of self-adjusting dogs are arranged within the setting-knee of the head-block, and are attached to a lever, from which they receive their vertical movement.

Claim.—1. The cant-hook dog *c*, having the lug c^2, in combination with the lever *b* and spring b^1, substantially as set forth.

2. The cant-hook dog *c*, having the lug c^2 and the swell c^4, in combination with a post or bearing at the pivoting-point *a*, and the spring b^1, substantially as set forth.

3. The combination of the cant-hook dog *c*, lever *b*, spring b^1, ratchet-plate *d*, and standard B', substantially as set forth.

4. The series of dogs *n* n^1, in any desired number, and having guides *e*, in combination with the stirrup *g*, guiding-strips e^1 of the standard B', and lever *b*, substantially as set forth.

5. The series of dogs *n* n^1 n^2, in combination with the guiding-strips e^1, the knee g^1, and block g^2, substantially as set forth.

145,027.—Malt-Polishing Apparatus.—WILLIAM W. STOLL, Brooklyn, N. Y. Application filed November 10, 1873.

The friction-pins have square heads, and, being inserted from the outside, cannot work loose and fall among the malt. A raised flange and inverted cup-cap prevent the malt from discharging at the sides of or clogging the vertical shaft.

Claim.—1. The combination of an adjustable discharge-spout with the feed-opening in the chamber A containing friction-pins *d* and agitating-pins *f*, which act upon the malt in said chamber, said spout serving to retain the individual grains for a longer or shorter period in the polishing-chamber, substantially as described.

2. The friction-pins *d*, provided with heads on their outer ends, and secured in the sides of the polishing-chamber from the outside, substantially as set forth.

3. The protecting-cap *h* and circular flange *g*, in combination with the shaft B and with the polishing-chamber A, substantially as shown and described.

145,028.—Last-Block Fastener.—NELSON R. STREETER, Groton, N. Y. Application filed November 21, 1873.

Claim.—A last-block fastener composed of a rigid rod or strip of metal, bent as described, and pivoted to one or both sides of the last, so as to freely swing back and forth, in combination with the block *b*, having its rear end notched or slotted to receive the clasp, substantially as shown and described.

145,029.—Horse Hay-Rake.—GEORGE SWEET, Dansville, N. Y. Application filed October 30, 1873.

The independently-hinged teeth pass through loops in evener-bars, centrally pivoted to the rear of the axle. Rake is lifted by friction-brakes acting on the supporting-wheels.

Claim.—1. The evener-bars H H, pivoted in their centers, and provided with loops *a a*, through which the rake-teeth pass, and having slots *x x* in their ends for the passage of the pins *b b*, all substantially as and for the purposes herein set forth.

2. The hand or pawl *d*, in combination with the notch *y* and projection *i*, all as and for the purposes herein set forth.

145,030.—Ticket-Box for Railroad-Cars.—GEORGE C. THOMAS, Brooklyn, N. Y. Application filed December 7, 1871.

The recessed head, when moved to present its opening for the ticket, trips the spring-seated tilt and deposits the preceding ticket it supported into the lower compartment.

Claim.—The combination, in a ticket-box having a glazed front, of the inclined spring-tilt F, bearing with its lower edge against the glass, with the recessed and pivoted block D and its trigger *i*, all as set forth, for the purpose specified.

145,031.—Saw-Mill Dog.—JOHN TORRENT, Muskegon, Mich., assignor to STEARNS MANUFACTURING COMPANY, Erie, Pa. Application filed October 15, 1873.

A series of self-adjusting dogs are arranged upon a vertically-moving bar.

Claim.—1. The box or case H, having one or more latch-dogs, in combination with a standard, D', and lever A, substantially as described.

2. The automatically-operating dog *a*, having a preponderance of weight back of its pivoting-point, in combination with the box or case H.

145,032.—Device for Operating Sash-Doors.—HIRAM B. TRIPP, Boston, Mass. Application filed July 10, 1873.

A knob-spindle, arranged to turn in the door, is connected, by means of a rack-bar, with a rotating rod having cams that turn in slots formed in the hinges, so that by turning the knob the door may be thrown outward sufficient to disconnect the tongues and grooves of the door and jamb, and permit the door to swing open.

Claim.—1. A safe-door hinge, C^3, consisting of the leaves *a b c*, connected together and applied to said door and safe-body as herein described, in combination with the rod D having cams or eccentrics *l l* and a spindle arranged to turn within the door and connected with rod D, as herein described, for the purpose set forth.

2. The combination, with a door hung substantially as herein described, of a spindle arranged to turn within the door, when such spindle is connected to the rod or other part for operating said door-hanging, substantially as and for the purpose described.

3. The combination, with a door hung substantially as herein described, of a spindle arranged to turn within the door, when such spindle is adapted to both actuate the rod D, or its equivalent, for operating said door-hanging, and to throw the bolts on the door substantially as described.

145,633.—Curry-Comb.—JOHN W. TAUSSELL, Troy, N. Y., assignor to WILLIAM P. KELLOGG & Co., same place. Application filed June 17, 1873.

Formed of right-angle sections of sheet metal, one edge being toothed, the other forming part of the back and barely lapping the angle of its preceding piece. A metal brace or strap passing through a slot at the base of each toothed part, at each end of the comb, is centrally riveted in each space between the toothed plates.

Claim.—1. A curry-comb formed in sections A A′, overlapping only enough to form a bearing at the angle of the next section in the series, and with braces B B, passing along the inner faces of the back through slots, and confined to the sections of the back by rivets, substantially in the manner as set forth.

2. A curry-comb constructed in sections A A′, in which are slots to receive braces B B′, passing along the back, to which they are secured by rigets, the ends of the slots forming shoulders to relieve the rivets from lateral strain, substantially as set forth.

145,634.—Ironing-Machine.—JAMES T. WALKER, Albany, N. Y. Application filed October 16, 1873.

A stationary frame has arranged above it an adjustable movable frame, and in these frames are journaled sets of drums and heating-rollers, so that the goods can be ironed on both sides while passing between them on endless belts, and then dried by passing through another set of rollers.

Claim.—1. The combination, with a stationary and a movable frame, in an ironing-machine, of the drums A and B and one or more heated rollers, C C′, and one or more heated rollers, D, for ironing goods on both sides, substantially as herein set forth.

2. The combination, with a stationary and a movable frame, in an ironing-machine, of the drums A and B, one or more heated rollers, C C′, one or more heated rollers, D, and one or more drying-rollers, E, all substantially as and for the purposes set forth.

3. The combination, in an ironing-machine, of a stationary frame, Z, provided with a drum, A, endless belt M, and one or more ironing-rolls, D, and an adjustable frame, Z′, provided with a drum, B, and one or more ironing-rolls, C, substantially as and for the purposes herein set forth.

4. The combination, in an ironing-machine, of a stationary frame, Z, provided with drums A A′, endless belts M N, and one or more ironing-rolls, D, and an adjustable frame, Z′, provided with a drum, B, one or more ironing-rolls, C, and one or more drying-rolls, E, all substantially as and for the purposes herein set forth.

145,635.—Car-Axle Journal.—JOSEPH WHITAKER, Woonsocket, R. I., assignor to SIMEON S. COOK, same place. Application filed July 14, 1873.

Claim.—The shaft or journal *d*, tapering outward from its inner to its outer end, in combination with the lubricating-box *a*, having the groove *f* at its inner end, adapted to hold the packing and supply the lubricant to the inner end of the journal, substantially as described, for the purpose specified.

145,636.—Chair-Rocker.—MONROE WILCOX, and CHARLES DEFLENDRE, Canadaga, N. Y. Application filed August 7, 1873.

A wide bearing-strip and a central rib, having a flange on its upper edge, adapted to receive a slotted leg.

Claim.—The metallic rocker A, consisting of the wide bearing-strip *a*, central rib *c*, and flange *b* on the upper edge, adapted to receive the adjustable socket D, as specified.

145,637.—Potato-Digger.—ADAM WILLMANN, Mount Carmel, Ill. Application filed October 18, 1873.

A plow for digging potatoes, provided with a shoe extending from front to rear. To the front of the shoe is attached a concave share, to the rear edge of which are secured tines for separating the earth from the potatoes. The shoe is secured to the beam by front and rear standards.

Claim.—The combination of the plow-beam A, standards C C′, horizontal shoe D, nose E, and screen F, said screen being flat, and composed of the diverging tines *e* fixed at an incline and upon the same general inclination with the nose E, substantially as described.

145,638.—Cultivator.—BURREL W. WINGO, Chillicothe, Mo., assignee of one-half his right to JESSE H. DAVIS, same place. Application filed June 28, 1873.

The standards extend above the beam to which they are pivoted. They are adjusted by a pin, which passes through them and through holes in a semi-elliptical plate which is secured to and rises above the beam.

Claim.—The plow herein described, having the adjustable standards B B pivoted one on each side of the beam A, and the bent brace C secured at one end to the standard B and at the other end to the semi-elliptical plate D, and plow-beam A, as and for the purpose specified.

145,639.—Caisson.—ADOLPH G. WOLFGRAM, Apex, N. C. Application filed October 2, 1873.

The caisson is made to conform to the shape of the structure to be erected within it, and is provided with an external flange at its bottom, to which the base is secured by means of short screw-bolts, which pass through the flange into the base, a water-tight rubber packing being placed between the flange and base. When the structure is completed and the caisson is to be removed, the screw-bolts are withdrawn by a long key operated from above, which fits their square heads and is held thereon by a spring-catch. Guide-rods are secured to the outside of the caisson, by which a diver can guide its descent. The top of the caisson is provided with a cover and rubber packing to protect the interior from rain and high water.

Claim.—1. The body of the caisson, A, made in the form described, and provided with the flange C, to receive the screw-bolts *f* for securing the base F in position, substantially as and for the purpose specified.

2. The base F and body A, connected together by screw-bolts having recessed heads to receive the key G, substantially as described, whereby the body A can be detached from the base when a pier or foundation is built thereon, as set forth.

3. The guiding-rods E, connected with the outer surface of the caisson and its flange C, to operate substantially as and for the purpose specified.

4. The guide-rods E, having a collar, *e*, in combination with the braces D, body A, and flange C, to operate substantially as and for the purpose specified.

5. The body A of the caisson, provided with the protecting-top I and a packing, *p*, substantially as and for the purpose specified.

145,640.—Curtain-Fixture.—JOHN F. WOLLENSAK, Chicago, Ill. Application filed August 20, 1873.

A reversible roller is used in connection with a reversible spring-locking pawl, provided with two radial cord-arms. The roller is also provided with a peripheral groove, and also lugs for engagement with the spring-locking pawl having the two radial cord-arms.

Claim.—1. The spring-locking pawl provided with the radial cord-arms H H, locking-head J having the lug K, and spring M, substantially as described.

2. The roller D, provided with a peripheral groove for the shade-cord, and lugs E E, in combination with the spring-locking pawl having radial arms H H and head J, substantially as described.

145,641.—Railway-Frog.—JOSEPH WOOD, Red Bank, N. J. Application filed June 12, 1872.

The rails of the frog have a block of wood inserted between them, and firmly secured thereto by bolts. The tongue of the frog is slightly elevated above the level of the side rails.

Claim.—1. A railway-frog with wood placed between the rails thereof, and fastened thereto, in the manner and for the purpose substantially as described.

2. A railway-frog with the tongue elevated above the side rails, substantially as herein described.

REISSUE PATENTS.

5,667.—Extension-Table for Sewing-Machines.—JOSEPH BENNOR, Philadelphia, Pa., assignor, by mesne assignments to NISBET D. STOOPS and JOHN B. MYERS, same place. Patent No. 136,939, dated March 18, 1873. Application filed September 30, 1873.

When the cover is used as an extension, it is connected to the table by a turning and sliding rod, having a hook on its front end that engages with an eye-plate on the cover. Said rod is also provided with an arm that abuts against the cover below the eye-plate. The rear end of the rod has two lugs that enter notches in a block attached to the under side of the table.

Claim.—1. The turning and sliding rod B, provided at its front end with the hook *g*, and at its rear end with the lugs *i* and *k*, in combination with the block *e*, having notches *m* and *n*, and with the eye-plate *c* of the cover, for holding it in connection with the top A, substantially in the manner and for the purpose above described.

2. The rod or bracket B, having a hook, *g*, and arm *h*, in combination with a sewing-machine table and cover, D, substantially as described.

5,668.—Gate-Latch.—JAMES BULL, Galesburg, Ill., assignor to VAN WAGONER & WILLIAMS, New York.—Patent No. 71,094, dated December 3, 1867. Application filed July 25, 1873.

Claim.—1. A movable double catch or latch with a dovetail recess located between its two ends, which are provided with frictional surfaces on the dovetail side of the catch, and act each as the sole counter-balance to the other.

2. A movable double catch or latch with a dovetail recess located between its two ends, arranged to operate in connection with, and barely but easily receive, a detaining-stop corresponding in size to the dovetail recess, as set forth.

3. A movable double catch or latch with a dovetail recess located between its two ends, which are provided with frictional surfaces, and act as counter-balances each to the other, and having its vibrations limited by alternate stops within a quadrant of a circle.

4. A movable double catch or latch with a dovetail recess located between its two ends, which are provided with frictional surfaces, and act as sole counter-balances each to the other, and which is secured by a single pivot-screw to the latch-plate.

5. A vibrating double catch or latch with a dovetail recess located between its two ends, which act as counter-balances each to the other, in combination with the protecting projections *e e* on the latch-plate.

5,669.—Manufacture of Paint.—FREDERICK W. GERDES, Allegheny City, Pa.—Patent No. 110,087, dated December 13, 1870. Application filed November 17, 1873.

Claim.—1. Argillite or argillaceous slate, in combination with white lead or oxide of zinc, in the manufacture of paints, substantially as set forth.

2. The combination of argillite or argillaceous slate, Prussian blue, or other equivalent blue pigment, white lead or zinc-white, and linseed-oil, so as to form a blue paint for oil-casks and other articles, substantially as set forth.

3. As an ingredient in the manufacture of paints, resin varnish prepared by dissolving resin in benzine, or other like distillate, and incorporated with the body of the paint before grinding, substantially as set forth.

4. The combination, by means of grinding, of resin varnish, prepared as described, with white lead or oxide of zinc, in the manufacture of paint, substantially as set forth.

5,670.—Boot.—PRESBURY WEST and GEORGE S. LEE, Worcester, Mass.—Patent No. 142,494, dated September 2, 1873. Application filed October 31, 1873.

Claim.—A boot, the seams of which are closed upon the outer side, and formed by means of metal fastenings, for the purpose set forth.

INDEX OF INVENTIONS PATENTED NOVEMBER 25, 1873.

	Class No.	Whole No.
Acid, manufacture of sulphuric, J. Saunders	35	144,988
Alarm, automatic fire, C. H. Lehnis	94	144,991
Anchor, Z. Hall	26	144,991
Animals, stock for shooing, J. Ditch	144	144,983
Axles, machine for turning carriage, W. Jones	51	144,988
Baking mold, G. Wingate	68	144,939
Balances, weighing and price, A. M. Maynard	132	144,914
Barrel hoop, H. Ogborn	40	144,980
Barrel washer, A. Muntzenberger	49	145,003
Bed bottom, Crosby and Cameron	62	144,939
Bed bottom, R. Hoyt	62	144,906
Bed bottom, C. B. Spencer	62	145,023
Bed spring, W. W. Jones	62	144,984
Bee hive, W. S. Hough	9	144,847
Beer, apparatus for preserving and forcing, E. C. Krasnicki	19	144,967
Billiard cue clamp, O. D. Benjamin	143	144,894
Bird cage, E. Hutchinson	170	144,907
Blackboard, adjustable, F. W. Moeller	146	144,917
Boiler, farmer's, P. Colvin	1	144,890
Boilers, heater and feeder for, G. C. Williams	148	144,937
Boot, West and Lee, (reissue)	16	5,670
Boots and shoes, machine for making wood shanks for, W. N. Sprague	16	145,024
Boots, &c., crimping apparatus for, M. R. Marcell	16	144,995
Bottle, glass, Borden and Trimble	1	144,895
Brush, paper hanger's, J. M. McComb	22	144,899
Butter tube, &c., heap for, H. C. Carter	30	144,889
Caisson, A. G. Wolfgram	39	145,039
Car axle box, D. Munsey	103	145,004
Car axle journal, J. Whitaker	103	145,025
Car coupling, A. F. Chandler	103	144,954
Car coupling, J. T. L. Cochran	103	144,956
Car, dumping, Elliott, Harrington, and Davenport	131	144,903
Cars, ticket box for railway, G. C. Thomas	42	145,030
Carburetor, J. Musgrave	37	144,936
Carding, apparatus for delivering and drawing long fibered wool after, J. and J. Dobson	22	144,949
Caster, sewing machine, J. K. Prester	134	145,011
Chair rocker, Wilcox and Depledge	36	145,036
Cloth, machinery for finishing the nap of woolen, J. Dobson	37	144,939
Clothes drier, Burch and Webb	91	144,951
Clothes tongs, E. A. Foulke	91	144,972
Coffee pot, Weber and Kautzen	38	144,938
Cop tenoning machine, S. W. Long	173	144,992
Collar and cuff drier, D. W. De Forest	91	144,889
Corn conveyor, J. A. Moore	114	144,918
Corset, woven, J. Oltenheimer	39	144,941
Cultivator, L. Haverstick	43	144,946
Cultivator, B. W. Wingo	43	145,038
Cultivator, hand, A. W. Rees	43	144,927
Curry comb, J. W. Trussell	144	145,029
Curtain fixture, J. F. Wollensak	62	145,040
Digger, potato, A. Willmann	114	145,037
Drain tile, J. Loffler	20	144,990
Dyeing, mordant for, Burgess and Le Rhett	11	144,892
Dynamometer, G. W. Bigelow	132	144,945
Earth boring machine, S. R. Owen	51	145,007
Engine, rotary, Baker and McIntire	150	144,932
Engine, rotary, L. H. Woods	150	144,941
Engine, steam, A. Beckman	150	144,953
Engines, combined quarter connection and parallel motion for, A. J. L. Lorets	150	144,938
Engines, valve actuating mechanism for, F. Chase	152	144,931
Fertilizer, manufacture of, H. Stevens	96	144,977
Fire arm, breech loading, Scott and Matthews	18	144,970
Fire arm, breech loading, H. W. Sherman	18	144,972
Fire indicator and alarm, J. Fawcett	94	144,995
Fishing stake, J. O. Campbell	143	144,893
Flour, machine for the manufacture of, T. Carr	57	144,890
Forge, blacksmith's, W. T. Kellogg	60	144,996
Fumigator, A. R. Denlinger	63	144,998
Furnace, blast, F. Buttgenbach	85	144,893
Furnace for desulphurizing ores, Hegeler and Matthiessen	85	144,994
Garden cultivating implement, D. Mack	114	144,919
Gas carbureting apparatus, A. W. Porter	37	144,983
Gas manufacture, H. Skolnos	96	145,021
Gas meter, paper dry, Schüssler and Dieterich	64	144,999
Gas pipes, apparatus for removing obstructions from, Goldsmith and Dilkes	4	144,943
Gas retort mouth piece, P. Munzinger	4	144,957
Gate, farm, W. Lucas	35	144,994
Governors, safety appliance for, J. Gaskell	69	144,973
Grain scourer, C. B. Horton	57	144,999
Grain separator, S. Day	159	144,936
Grape and flower picker, C. W. H. Delano	63	144,937
Grass cutting machine, flower maker's, T. and J. Millet	54	144,916
Grindstone wetting device, D. Cumming, Jr.	70	144,891
Hamper, teak, G. J. Capewell	29	144,953
Hammers, machine for forging, W. Evans	60	144,969
Harness pad, S. A. Marker	72	144,853
Harness safety strap, C. W. Nichols	72	145,006
Harrow, L. C. Rumberger	73	145,016
Harrow, circular, G. W. Hills	73	144,978
Hat conformator, J. J. McKnight	76	144,855
Heel stiffeners, machine for making, J. Samuels	16	145,017
Hinge, blind, L. Gathmann	24	144,898
Hinge, shutter, W. Feaket	24	144,971
Hog ringing pincers, J. C. Schoettle	35	144,987
Horseshoe, R. F. Cooke	60	144,853
Horseshoe nails, machine for finishing, S. S. Putnam	60	144,982
Hose coupling, T. J. Mayall	81	144,997
Hose coupling spanner, L. Pond	167	144,888
Hose pipes, stop nozzle for, J. N. Allen	167	144,948
Indicator, pneumatic station, Kealy and Rigney	158	144,909
Ingot for alloying gold and silver, manufacture of copper, J. Feix	99	144,896
Inkstand, B. Brower	146	144,925
Inkstand, T. S. Shenston	146	144,920
Iron, finery fire for the manufacture of, Ash and Walker	85	144,921
Ironing machine, J. F. Walker	91	145,034
Jack, lifting, Hamilton and Conner	79	144,977
Knit fabric, B. J. McGee	88	144,915
Ladder, fireman's, M. Cronin	30	144,956
Last block fastener, N. R. Streeter	16	145,018
Laster, shank, W. H. Hanna	16	144,903
Latch, door, F. Stowe	28	144,931
Latch, gate, J. Bull, (reissue)	83	5,668
Leather splitting machine, Goebel and Preis	92	144,980
Letter box, B. E. Gurley	146	144,976
Locomotive smoke stack, J. V. Bishop	94	144,894
Lubricating compound, N. D. Smith	87	144,875
Malt polishing apparatus, W. W. Stoll	19	145,027
Measuring device for spooling machines, Keith and Seaver	42	144,985
Medical compound, G. F. Munro	98	145,008
Milk cooler, Crane and Hadley	58	144,835
Mill, fulling, R. Eickemeyer	76	144,841
Millstone dressing machine, diamond, D. Larer	153	144,851
Mop wringer, A. W. Bunnell	91	144,730
Nail machine, cut, W. Haddock	103	144,845
Needle threader, F. R. Gaspary	104	144,974
Nut lock, W. H. Bowman	14	144,888
Nut lock, C. Dittman	14	144,964
Nut lock, C. A. Howard	14	144,985
Oil cabinet, T. Miller	107	144,856
Oven for plate glass, flattening, J. B. Boulicault	68	144,946
Pail, folding, Du Chateau and Williams	63	144,733
Paint, manufacture of, F. W. Gerdes, (reissue)	107	5,669
Paper machines, stuff regulator for, D. Hamel	106	144,902
Photographic plate holder, A. Sommeddinger	111	145,020
Piano string bridge, W. C. Ellis	119	144,849
Pipe coupling, D. Ashworth	81	144,743
Plane, metallic, J. F. Baldwin	100	144,885
Planing machine, J. Rankin	173	145,013
Planter, corn, J. G. La Fonte	133	144,949
Planter, hand corn, M. P. Nemmers	133	144,919
Plow, A. K. Dahl	114	144,960
Plow, steam, Allen, Browen, and Moulthrop	114	144,730
Plug, testing, J. Allin	40	144,881
Power, spring, T. Ebeling	67	144,894
Press, hand power baling, P. C. Ingersoll	7	144,980
Printing presses, feeding paper to rotary, J. T. Ashley	117	144,886
Printing upon and decorating enameled surfaces, apparatus for, S. J. Haggeon	54	144,979
Propellers, operating screw, A. McDonald	120	145,000
Pump, J. W. Douglass	118	144,965
Pump valve, Gould and Campbell	118	144,844
Purifier, middlings, E. N. Lacroix	57	144,998
Quicksilver, process of purifying, Randel and Wright	99	144,889
Radiator, steam, A. L. Ide	147	144,926
Railway frog, J. Wood	120	145,041
Railway rail fastening, A. M. Reese	120	145,015
Railway switch, T. J. Reynolds	120	145,012
Railway switch, W. A. Slingerland	120	144,930
Railway switches, operating, J. Wood	120	144,939
Railway switch, self-closing, Habbell and Gregory	120	144,946

	Class No.	Whole No.
Rake, horse hay, G. Sweet	77	145,029
Refining and deslivering lead, apparatus for, G. Luce	99	144,992
Register for machinery, S. F. Payne	42	144,981
Rubber, &c., apparatus for mixing vulcanizable compounds of, T. J. Mayall	35	144,998
Saddle, T. H. McGrath	72	145,001
Safe doors, operating, H. B. Tripp	198	145,033
Sample case, revolving, J. F. Randolph	146	144,994
Sap spout, H. B. Sevey	63	144,971
Saw mill dog, E. H. Stearns	130	145,026
Saw mill dog, J. Torrent	130	145,031
Saw mill head block, Prescott and Barnaloux	130	144,986
Saw set, W. J. Boynton	131	144,947
Scraper, road, R. F. Read	51	144,925
Scraper, road, Warner and Kingsley	51	144,935
Seeder, broadcast, J. R. Scarborough	133	145,018
Seeding machine, M. Schnapp	133	145,019
Seeding machine, E. Wittsigman	133	144,979
Sewer bottom, cement M. Day	51	144,961
Sewing machine, D. Porter	134	144,864
Sewing machine, O. St. Amant	134	145,025
Sewing machine caster, J. K. Proctor	134	145,011
Sewing machines, extension table for, J. Bennor, (reissue)	134	5,667
Shovel, sifting, C. Kneedler	154	144,850
Signal, fog, G. C. Pattison	138	145,008
Signal, railway, E. E. Marshall	139	144,854
Skirt, skeleton, F. Lippmann	90	144,911
Sleigh brake, T. H. Bromley	31	144,949
Smoke consuming apparatus, W. B. W. Smith	149	145,022
Soda water tumblers, holder for, J. Matthews	1	144,913
Spark arrester, G. Swanson	94	144,932
Spinning machine spindle, W. G. Perry	142	145,009
Spoke setting machine, W. R. Greene	31	144,900
Spooling machines, measuring device for, Keith and Seaver	42	144,985
Spring, door, F. H. Richards	24	144,928
Steel, manufacture of, C. M. Nes	85	145,005
Steiner, sherry, Rusk and Kirk	88	144,887
Stove pipe stretcher, &c., G. Elsey	136	144,967
Strap coupling, T. Cogswell	61	144,957
Stubble shaver and scraper, combined, Von Phul, Jr., and Mallon	43	144,933
Sulky, L. H. Jennison	31	144,963
Suspenders, T. J. Flagg	38	144,970
Table, ironing, L. Scofield	91	144,869
Tablet, writing, C. W. Brown	146	144,950
Tan drying apparatus, N. Porter	48	145,010
Thrashing machine, J. Smith	159	144,874
Toy, automatic, A. H. Dean	143	144,892
Trap, fly, Packard and Standish	143	144,860
Truss, brace, H. H. Reedel	156	145,014
Umbrella, H. L. Power	165	144,865
Umbrella, C. R. Spencer	165	144,876
Valises, &c., device for connecting frames of, C. Votti	162	144,878
Valve, A. Marriott	152	144,996
Varnish, refining, F. Kersting	107	144,910
Varnish or polish for wood, metal, &c., J. F. Chevalier	107	144,955
Veneer cutting machine, W. H. Williams	176	144,938
Vessels' booms, anti-friction attachment for, H. Gregory, Jr	138	144,975
Vessels, center board for, J. Espalla	157	144,966
Vise, adjustable bench, J. B. Wardwell	99	144,934
Wagon brake, E. N. Jack	31	144,849
Watch, steam winding and setting, E. J. Pacaud	36	144,859
Watches, reversible center pinion for, O. Gates	36	144,897
Water tank for hotels, J. H. Corey	51	144,834
Water wheel, B. J. Barber	168	144,944
Whiffletree, D. S. Sloan	31	144,873
Wire drawing machine, J. and E. Woods	163	144,940
Wood, compound for filling, C. E. Bradley	35	144,942
Wrench, T. L. Buckley	160	144,826
Wrench bars, die for forging, L. Coes	60	144,836
Wrench, hose, E. Bucklin, Jr	81	144,827

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED NOVEMBER 25, 1873.

Allen, I. S., M. P. Browne, and C. W. Moulthrop, Steam plow 144,939
Allen, J. M., Step nozzle for hose pipes 144,942
Allin, J., Testing plug 144,861
Ash, T., and Z. Walker, Finery fire for the manufacture of iron 144,921
Ashley, J. T., Feeding paper to rotary printing presses 144,923
Ashworth, D., Pipe coupling 144,943
Baker, S., and S. C. McIntire, Rotary engine 144,858
Baldwin, J. F., Metallic plane 144,822
Barber, B. J., Water wheel 144,944
Barnaloux and Prescott 144,986
Beakman, A., Steam engine 144,983
Benjamin, O. D., Billiard cue clamp 144,824
Bennor, J., Extension table for sewing machines, (reissue) 5,667
Bigelow, G. W., Dynamometer 144,945
Bishop, J. V., Locomotive smoke stack 144,894
Bogart, P., Jr., assignee 144,938
Borden, J., and J. L. Trimble, Glass bottle 144,985
Boulicault, J. B., Flattening oven for plate glass 144,946
Bowman, W. H., Nut lock 144,826
Boynton, W. J., Saw set 144,947
Bradley, C. E., Compound for filling wood 144,948
Branch, J. W., assignee 144,906
Broadwell, B. F., assignee 144,910
Bromley, T. H., Sleigh brake 144,949
Browne, Moulthrop, and Allen 144,820
Brower, B., Inkstand 144,825
Brown, C. N., Writing tablet 144,950
Buck, E., and E. W. Kirk, Cherry stoner 144,987
Buckley, T. L., Wrench 144,826
Bucklin, E., Jr., Hose wrench 144,827
Bull, J., Gate latch, (reissue) 5,668
Bunnell, A. W., Mop wringer 144,887
Burch, J., and B. Webb, Clothes drier 144,951
Burgess, E. O., and S. La Rhett, Mordant for dyeing 144,952
Butigenbach, F., Blast furnace 144,829
Cameron and Crosby 144,959
Campbell, J. O., Fishing stake 144,888
Campfield and Gould 144,844
Capewell, G. J., Task hammer 144,953
Carr, T., Machine for the manufacture of flour 144,830
Carter, H. C., Hasp for butter tubs, &c 144,839
Case, W. H., assignee 144,905
Chandler, A. F., Car coupling 144,954
Chase, F., Valve actuating mechanism for engines 144,831
Chevallier, J. F., Varnish or polish for wood, metal, &c 144,955
Cochran, J. T. L., Car coupling 144,956
Coes, L., Die for forging wrench bars 144,836
Cogswell, T., Strap coupling 144,957
Colt's Patent Fire Arms Manufacturing Company, The, assignee 144,973
Colvin, P., Farmer's boiler 144,890
Conner and Hamilton 144,977
Cook, S. S., assignee 145,035
Cooke, B. F., Horseshoe 144,833
Corey, J. H., Water tank for hotels 144,834
Crane, A. J., and D. J. Hadley, Milk cooler 144,835
Cronin, M., Fireman's ladder 144,958
Crosby, L. M., and E. G. Cameron, Bed bottom 144,959
Cumming, D., Jr., Device for wetting grindstones 144,891
Dahl, A. K., Plow 144,960
Davenport, Elliott, and Harrington 144,966
Davis, C. E., assignee 144,827
Davis, J. H. assignee 145,038
Day, M., Cement sewer bottom 144,961
Day, S., Grain separator 144,836
Dean, A. H. Automatic toy 144,892
De Forest, D. W., Collar and Cuff drier 144,838
Delano, C. W. H., Grape and flower picker 144,837
Denlinger, A. R., Fumigator 144,962
Depledge and Wilcox 145,036
Diederich and Schüssler 144,868
Dilkes and Goldsmith 144,843
Ditch, J., Stock for shoeing animals 144,963
Dittman, C., Nut lock 144,964
Dobson, J., Machinery for finishing the nap of woolen cloth 144,839
Dobson, J. and J., Apparatus for delivering and drawing long fibered wool after carding 144,840
Douglas, W. and B., assignees 144,965
Douglass, J. W., Pump 144,965
Du Chateau, A., and J. D. Williams, Folding pail 144,893
Ebeling, T., Spring power 144,894
Eickemeyer, R., Fulling mill 144,841
Elliott, J., J. P. Harrington, and W. R. Davenport, Dumping car 144,966
Ellis, W. C., Piano string bridge 144,842
Elsey, G., Stove pipe stretcher, &c 144,967
Erie Car Works, assignee 144,966
Espalla, J., Center board for vessels 144,968
Evans, W., Machine for forging hammers 144,969
Fawcett, J., Fire indicator and alarm 144,895
Foix, J., Manufacture of copper ingots for alloying gold and silver 144,896
Flagg, T. J., Suspenders 144,970
Foelket, W., Shutter hinge 144,971
Foulke, E. A., Clothes tongs 144,972
Frary, H. H., assignee 145,006
Gaskall, J. Safety appliance for governors 144,973
Gaspary, F. R., Needle threader 144,974
Gates, O., Reversible center pinion for watches 144,897
Gathmann, L., Blind hinge 144,898
Gaylord Manufacturing Company, assignee 144,861
Gordon, F. W., Manufacture of paints, (reissue) 5,669
Goebel, J., and J. Preis, Leather splitting machine 144,899
Goldsmith, G., and J. Dilkes, Apparatus for removing obstructions from gas pipes 144,843
Goodyear, C., assignee 145,024
Gould, E. J., and M. E. Campfield, Valve for pumps 144,844
Graham, J. R., assignee 144,938
Greene, W. R. Spoke setting machine 144,900
Gregory and Hubbell 144,848
Gregory, H., Jr., Anti-friction attachment for vessels' booms 144,976
Griscom, S. E., assignee 144,851
Gurley, R. R., Letter box 144,976
Guthrie, T. H., assignee 144,902
Haddock, W., Cut nail machine 144,845
Hadley and Crane 144,835
Hall, J., Anchor 144,901
Hamel, D., Stuff regulator for paper machines 144,902
Hamilton, J. T., and E. F. Conner, Lifting jack 144,917

Hanna, W. H., Shank lacer 144,903
Harrington, Davenport, and Elliott 144,966
Haverstick, L., Cultivator 144,846
Hegeler, E. C., and F. W. Matthiessen, Furnace for desulphurizing ores 144,904
Hill, W. G., assignee 145,017
Hills, G. W., Circular harrow 144,976
Hoggson, S. J., Apparatus for printing upon and decorating enameled surfaces 144,979
Horton, C. B., Grain scourer 144,907
Hough, W. S., Bee hive 144,847
Howard, C. A., Nut lock 144,905
Hoyt, E., Bed bottom 144,906
Hubbard, N., assignee 144,889
Hubbell, T. K., and G. H. Gregory, Self-closing railway switch 144,848
Hutchinson, E., Bird cage 144,907
Ide, A. L., Steam radiator 144,981
Ingersoll, P. C., Hand power baling press 144,908
Jack, E. N., Wagon brake 144,849
Jennison, L. H., Sulky 144,963
Jones, F. A., assignee 144,850
Jones, W., Machine for turning carriage axles 144,909
Jones, W. W., Bed spring 144,964
Kaestner, C., Sifting shovel 144,850
Kealy, J. P., and J. Rigney, Pneumatic station indicator 144,909
Keith, T. K., and A. Seaver, Measuring device for spooling machines 144,985
Kellogg & Co., W. P., assignees 145,023
Kellogg, W. T., Blacksmith's forge 144,909
Kersting, F., Refining varnish 144,910
Kingsley and Warner 144,935
Kirk and Buck 144,987
Knutson and Weber 144,936
Krauznick, E. C., Apparatus for preserving and forcing beer 144,987
Lacroix, E. N., Middlings purifier 144,966
La Fonte, J. G., Corn planter 144,969
Landis, D. N., Jr., assignee 144,964
Larer, D., Diamond millstone dressing machine 144,851
La Rhett and Burgess 144,952
Lee and West, (reissue) 5,670
Leffler, J., Drain tile 144,980
Lehnis, C. H., Automatic fire alarm 144,991
Leschorn, A., assignee 144,991
Lewis, J. H. and L. S., assignees 144,870
Lippmann, P. Skeleton skirt 144,911
Long, S. W., Machine for tenoning cogs 144,992
Lorets, A. J. L., Combined quarter connection and parallel motion for engines 144,852
Luce, G., Apparatus for refining and deslivering lead 144,992
Luce, Son & Rozan, assignees 144,993
Lucas, W., Farm gate 144,994
Mack, D., Garden cultivating implement 144,910
Mallon and Von Phul, Jr 144,933

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 30, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)	6,500
SEWING-MACHINES and attachments	2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes	4,000
PRINTING; including presses, type, and printers' furniture.	2,500
FELTING and HATS; including caps, bonnets, flock, &c.	1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)	1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs	1,400
CARRIAGES and WAGONS	6,000
BRIDGES; including ferry-guards, girders and columns, piers	400
CARDING, CLOTH, CORDAGE, KNITTING, SILK, SPINNING, WEAVING	4,800
RAILWAYS, complete, about	3,500
ELECTRICITY, (in progress,) to July, 1871	888
TEXTILE, (in progress,) to July, 1871, about	4,800

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant thereafter, unless he shall make a new application within two years from the date of notice of the original allowance.

The following abbreviated forms of the Patent Office classification by subject-matter may be of assistance to persons ordering copies of specifications and drawings by class. Of course the classes vary somewhat in number of patents, and in following a branch of industry it may be necessary to group several classes to secure absolute completeness. These groupings will readily suggest themselves to the inventor or mechanic.

Copy of classification in full for the use of subscribers furnished on application.

Alcohol liquor apparatus	1	Leather	92
Air and gas engines	2	Locks and latches	93
Amalgamators, ore-mills	3	Locomotives	94
Architecture	4	Looms	95
Artificial limbs, &c.	5	Manures	96

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—NORTHERN DISTRICT OF ILLINOIS.

TUESDAY, *October* 2, 1873.

Present, The Hon. HENRY W. BLODGETT, *Judge*.

FRANK STURGES, OLIVER H. LEE, AND WILLIAM S. POTWIN *vs.* ISAAC VAN HAGEN.*—*In Chancery.*

This cause having come on to be heard upon the bill of complaint, answer, and replication herein, and the proofs, documentary and written, taken and filed in said cause, now, therefore, on consideration thereof, and on motion of N. C. Gridley, counsel for complainant, it is ordered, adjudged, and declared, and the Court doth hereby order, adjudge, and decree that the Letters Patent of the United States of America, No. 114,068, bearing date the twenty-fifth day of April, A. D. one thousand eight hundred and seventy-one, and issued to the said defendant Isaac Van Hagen, be, and the same is hereby, revoked, vacated, and declared null and void, and of no effect, and that the said defendant Isaac Van Hagen be, and is hereby, divested of all right and interest he had, under and by virtue of said Letters Patent, in and to the "Improvement in Machines for Punching and Stamping Metal" therein described.

And it appearing to the Court, from admissions of the parties made on the hearing, that said defendant is the sole owner of said patent, it is further ordered, adjudged, and decreed that the said defendant, Isaac Van Hagen, do, within sixty days from the date hereof, surrender and deliver up to the clerk of this Court, the said Letters Patent No. 114,068. And thereupon the said clerk shall write with ink across the face of said Letters Patent the words "revoked, vacated, and declared null and void by the Circuit Court of the United States of America for the northern district of Illinois," and shall then transmit the said Letters Patent, so canceled, properly enveloped, to the "Secretary of the Interior of the United States of America, Washington, D. C." And it is further ordered, adjudged, and decreed, that the record of the said Letters Patent No. 114,068 be canceled, quashed, and annulled.

And it is further ordered that the clerk of this Court, after the expiration of sixty days from the date hereof, do transmit to the Secretary of the Interior, Washington, D. C., a certified copy of this decree.

And it is further ordered, adjudged, and decreed that the said complainants do recover of the defendant their costs and disbursements in this suit to be taxed.

* Van Hagen obtained his patent June 26, 1871. A man by name of Huntington applied for the same thing early in 1872. An interference was declared, and priority was awarded to Huntington July 25, 1872. (See *Commissioner's Decisions*, 1872, p. 164; or OFFICIAL GAZETTE, vol. 2, p. 116.)

DIGEST OF FOREIGN PATENT LAWS.

WÜRTEMBERG.

REPORT BY MR. GEORGE PETRE, OF THE BRITISH LEGATION.

Patents for invention are among the subjects enumerated in Article II of the constitution of the German Empire, as being reserved for imperial legislation. The question of the future maintenance, modification, or abolition of the patent system in Germany will have to be decided, consequently, at Berlin, by the representatives of the German nation, whenever the federal council and the reichstag have leisure to occupy themselves with this important matter. Pending such legislation, the patent laws and regulations of the separate states continue in force, and those of Würtemberg are comprised within so small and readable a compass as almost to dispense with the necessity of analysis or sum-

mary. They are contained in certain clauses of the Würtemberg general industrial code of 1836, which, in anticipation, probably, of a change in the law throughout the Zollverein States, were left unrepealed by the subsequent code of 1862, which, in its turn, has been superseded by the North German industrial code of 1869; the latter, however, (a translation of which was annexed to my report on the industrial classes, dated Berlin, 1869,) leaves the question of patents or patent rights untouched. The only modification which the clauses above mentioned in the industrial code of 1836 have received up to the present time, are contained in a law which was passed in 1842, in consequence of the establishment of the German customs union. One result of this law was to confer upon the subjects of the other states of the Zollverein the same rights in respect to patents as were enjoyed by Würtemberg subjects; and another most important one, which may be described as introducing the thin edge of the wedge, was to abolish the penalties attaching to the mere sale or importation from abroad of patented articles, without the consent of the patentee. Such, then, is the condition of the patent law in Würtemberg at the present moment.

I subjoin a translation of those clauses of the industrial code which relate to patents, interspersed with such ministerial orders in connection with them as have been issued from time to time, and also a translation of the law of 1842 above mentioned.

Patents in Würtemberg, as will be seen by a reference to the clauses of the industrial code, which treats of them, are divided into patents for invention ("Erfindungs-Patente") and patents for introduction, ("Einführungs-Patente.") The latter, however, have reference solely to foreign patents introduced into Würtemberg. A patent for invention, taken out in the Kingdom, includes and carries with it a patent also for introduction. All that is necessary to obtain the latter in the case of a foreigner or native is the production of a certified copy of the foreign patent, together with the written consent of the patentee to its introduction. Facilities for taking out patents in this country are considerable, and the expense is trifling. The law provides that every petition for a patent, accompanied by a specification in writing, sealed or open, as the applicant may prefer, shall be delivered at the district government office ("Bezirk's Amt") of the locality where the petitioner resides, and shall be immediately forwarded to the central board of trade and commerce at Stuttgart, which is a department of the ministry of the interior. The petition is then referred for examination to a commission *ad hoc*, whose business it is to examine the specification and report whether it is "useful and new."

As it is obviously impossible, in the great majority of cases, for the commission really to determine either of these points, the result is that all petitions, except those relating to inventions which are palpably absurd or notoriously not new, are forwarded to the ministry of the interior for acceptance, and the patents are published in the official gazette. The specification is kept secret, but inspection of it by persons interested is allowed, under certain conditions defined in clause 147.

No patent can be granted for a longer term than ten years, but the average period of grants is for five or even less. The patentee, however, can always obtain an extension of the term up to ten years. No fees are payable for the mere grant of a patent, but the patentee has to pay an annual tax ranging from 5 florins ($2.05) to 20 florins ($8.20) until the patent expires or is void. A foreigner patenting an invention in Würtemberg is obliged to find some native of the country to stand security for the annual payment of the patent-tax. All disputes or claims for damages arising out of alleged infringement of patent rights are decided administratively by the police. There is no appeal to the law courts, and no action for damages, as in England. Complaints of this nature are submitted to the district police office, which, in cases of proved and willful infringement of patent rights, has a power, not only of confiscating for the benefit of the patentee the tools or apparatus and articles manufactured in violation of such rights, but also of enforcing a restitution of the value of such articles already sold.

It is difficult to conceive a machinery less suited than that which exists in Würtemberg for the determination of the difficult and complicated questions which arise in connection with the alleged infringements of patent rights. The evil, however, is partially corrected by the ministerial orders of March 20, 1851, (following clause 156,) which leave it to the discretion of the local police authorities to allow the matters in dispute to be settled by the provincial government, and, in case of a complaint of infringement of patent rights being met by the plea of the nullity of the patent itself, require the whole matter to be referred to the ministry of the interior.

That the difficulties in the way of obtaining patents are infinitely less in Würtemberg than in Prussia is clearly shown in the statistical statement of patents issued in each of the different states of Germany in 1867, contained in Count Bismarck's message to the North German Parliament in December, 1868. In Prussia, with a population of 24,500,000, only 103 patents were issued; whereas in Würtemberg, with a population of less than 1,800,000, there were 139. The following is an official return of the number of patents granted in Würtemberg in each year during the period of 1862 to 1871, and during the eleven months of the present year:

Patents granted in—

1862	98
1863	79
1864	88
1865	92
1866	66
1867	139
1868	140
1869	114
1870	105
1871	97
Total	1,018
1872 (to November 30)	121

It will be seen by the above that 1867 and 1868 were exceptional years, and that the numbers have somewhat diminished since then, although they have recovered during the present year. About one-fifth of the patents annually granted in Würtemberg are taken out by foreigners, and fully one-third of the number become void, either because they are relinquished by the patentees or from not being put in operation for two years. It is probable that, owing to the trifling cost incurred, patents are often taken out here merely for advertising purposes, and with no serious intention of turning them to practical use.

Being anxious to obtain from a competent source a knowledge of the opinion held here in regard to the advantages or disadvantages of the present system, I consulted Dr. Steinbeis, the president of the board of trade and commerce, than whom no higher authority on all industrial matters exists in this part of Germany. Considering that the patent system as it is carried out in Würtemberg, even though it does not act injuriously upon local industry, at all events cannot be supposed to benefit it in any way, I was somewhat surprised to find his excellency so decided and vigorous an opponent of the abolition of patents. He considers that such a step would remove all incentive to the exercise of inventive talent, and would be highly injurious to industry in general; and he assured me that this opinion was shared by the majority of practical men here. The example of Switzerland, his excellency said, was rather in favor of than against those who advocated the maintenance of the patent system, as Swiss industry profited by foreign patents without contributing, or having any inducement to contribute, to the general stock of inventions. Referring to the watch-making trade in particular, he said that any improvements or inventions which were made by Swiss workmen, instead of being patented, which would insure their becoming within a certain period the property of the public, were handed down as family secrets from father to son.

Although an anti-abolitionist, President Steinbeis advocates a modification of the present system. He thinks that the cost of acquiring a patent—in Würtemberg, at least—should be much greater than it is; and although opposed to the remuneration of inventors by the state, he is of opinion that the patentee of an invention should be compelled to put a certain price beforehand upon the use of it, under such conditions as to place the advantages of it within the reach of the industrial public without depriving the inventor of his legitimate reward.

COMMISSIONER'S DECISIONS.

HOLMES AND SPAULDING.—*Reissue.*

[*In the matter of the application of Daniel Holmes and John Spaulding, for reissue of patent No.* 19,465, *dated February* 23, 1858, *reissued May* 13, 1862, *No.* 1,307, *and extended February* 27, 1872. *Subject*, CARPET-BEATING MACHINE.—*Decided December* 4, 1873.]

An assignment of a *patent* does not convey the extended term. Neither does the assignment of the *invention* or *improvements*, something more explicit being necessary to indicate the intention of the parties to transfer the interest in the extension.

Both the legal and equitable interest in the extended term may be conveyed before the extension has been granted, and probably also before the grant of the patent.

LEGGETT, *Commissioner:*

The question has been raised under Rule 63, in making up the file of this application, whether all the parties in interest have joined in the application. The inventors were Joseph Harris and Daniel Holmes. Previous to the grant of the patent, and on the day of making application therefor—to wit, the 15th day of December, 1857—they executed an assignment of the invention to Holmes, and requested that the patent be issued to him, which was done. The question is whether that assignment conveyed the extended term of the patent, which has recently been obtained. If it did, then this application is concurred in by all the parties in interest: and if it did not, then Harris or his assignees now have an interest, and should be joined.

The Supreme Court of the United States in *The Nicholson Pavement Company* vs. *Jenkins* (OFFICIAL GAZETTE, vol. 1, p. 465) said: "An assignment of an interest in an invention secured by Letters Patent is a contract, and, like all other contracts, is to be construed so as to carry out the intention of the parties to it. * * * There is no artificial rule in construing a contract, and effect, if possible, is to be given to every part of it, in order to ascertain the meaning of the parties to it."

A deed assigning in terms all one's right, title, and interest in a *patent*, it is well settled, does not convey the extended term. It must be expressly conveyed—and the intention to convey it must appear from the language of the deed—or it will not pass. But both the legal and equitable interest in the extended term may be conveyed before the extension has been granted, (*R. R. Co.* vs. *Trimble*, 10 Wallace, 367,) and probably also before the grant of the patent.

I know of no case in which the mere assignment of the *invention* or *improvements*, either before or after the grant of the patent, has been held to convey the extended term. Something more explicit is required. In both the cases before the Supreme Court, above cited, in which it was held that the respective assignments there under consideration conveyed the extension, the language fully and clearly indicates an intention to convey it. The patents had been granted, and the words in the granting clauses, after conveying the patents, expressly conveyed all future interests in them which might accrue to the assignors.

The following sufficiently exhibits the assignment in this case:

And whereas Daniel Holmes aforesaid has agreed to purchase from us all the right, title, and interest which we have or may have in and to the said invention, and in and to the said Letters Patent to be granted therefor, and has paid to us, &c.,

Now, therefore, this indenture witnesseth that for and in consideration of the said sum to us paid we have assigned and transferred, and do hereby assign and transfer to the said Daniel Holmes, the full and exclusive right to all the improvements made by us, as fully set forth and described in the specification which we have prepared and executed preparatory to obtaining Letters Patent therefor. * * * And we hereby authorize and request the honorable Commissioner of Patents to issue the said Letters Patent to the said Daniel Holmes, as the assignee of our whole right and title thereto.

Taking this whole deed together, in accordance with the rule stated by the Supreme Court, above referred to, so as to give effect, if possible, to every part of it, I think it quite clear that there is no intention exhibited to convey, and therefore that there was no conveyance of, the extended term. The only words which, without qualification, might clearly indicate such an intention are the following in the recital: "And whereas Daniel Holmes aforesaid has *agreed to purchase* from us all the right, title, and interest which *we have or may have* in and to *the said invention, and* in and to *the said Letters Patent* to be granted therefor."

Then follows the granting clause conveying "all the *improvements* made by us, as fully set forth and described in the specification, preparatory to obtaining Letters Patent therefor."

Were this all, the effect of the instrument might, perhaps, be a matter of doubt; but then follows what was evidently intended as the *habendum*—always of impor-

tance in aiding a proper construction of the granting part of a deed—which clearly specifies that Holmes is to hold, as assignee, the "*patent*" merely. This limitation of his interest is apparently in conflict with the language of the recital; but it may be harmonized with that language by construing the words "*or may have*," in the recital, as referring to the patent which was about to be obtained when the assignment was made. Either that must be done or the *habendum* must be ignored, which would be contrary to both law and reason.

I think Harris or his assignee has an interest in the extended term, and should join in this application for reissue.

LONES, VERNON, AND HOLDEN.—*Appeal.*

[*Appeal from the Primary Examiner in the matter of the application of Lones, Vernon, and Holden, for patent for* IMPROVEMENTS IN THE MANUFACTURE OF CARRIAGE-AXLES.—*Decided December 3, 1873.*]

Machinery for forming and completing a carriage-axle, and distinct machinery for polishing it after it is completed, cannot be treated as a combination nor considered under one application.

Where two machines produce a result when they operate in conjunction, which they could not accomplish by their independent and disconnected action, they may be embraced in one patent as a combination.

Eynon's case, Commissioner's Decisions, 1871, p. 239, commented on and explained.

LEGGETT, *Commissioner:*

Applicant proposes to make a metallic wagon-axle of a certain configuration, by taking certain steps for its manufacture; and he describes and illustrates certain machinery adapted to the purpose. In addition to that for forming the axle from a suitably-prepared blank, he also describes and claims certain machinery for polishing the axle after it has been in other respects completed. This latter machinery he admits has no necessary connection with the former in its operation; but, if desired, it may be driven by the same power-shaft. Whether so driven or not, however, there is no dependence of the one mechanism upon the other—no relation other than that of different independent machines for operating upon the same article, at different times and for different purposes, in the progress of its manufacture.

The two machines in no sense constitute a combined apparatus. That for polishing the axle is as disconnected in the part it performs from that for forming it as is the machinery for forming the blank, or that for making the fagot. Yet a claim for the combination of the two machines is presented in an amendment, and the decision in the *Eynon case* (Commissioner's Decisions, 1871, p. 239) is relied on to authorize it.

That decision, however, is not authority for the proposed claim. The result, or effect, is the proper test of the validity of a combination. By the combination of machines, in that case, a result was accomplished which could not be by their independent and disconnected operation. It enabled a better article to be produced at a diminished cost and in less time than before. It was because of this result that the union of the machines into one co-operating apparatus was resorted to. There is no such object or effect in the present case, and, therefore, the combination claimed has no legal foundation.

In my judgment the Examiner is clearly right in requiring a division of this application, and his decision is, therefore, affirmed.

THOMAS J. MAYALL.—*Extension.*

In the matter of the application of Thomas J. Mayall, for extension of Letters Patent for IMPROVEMENT IN THE MANUFACTURE OF INDIA-RUBBER HOSE, *granted November 29, 1859, reissued No. 5,111, October 22, 1872.—Decided November 28, 1873.*]

Where it appeared in proof that the antiseptics specified in a patent for preparing canvas to make hose were inefficient, under the conditions necessary to the manufacture, but that the inventor actually used another efficient antiseptic, and in fact made a meritorious invention, *Held*, that the patent could be reissued to include the antiseptic actually employed.

It is immaterial that the inventor was and is yet in total ignorance of the scientific nature of what he employed and what he did. Seeking a certain result, the only question of importance is, what did he actually produce?

The questions of infringement and what are equivalents are not proper questions to be decided in an application for extension, especially when they are pending in court.

A just test and ascertainment of the actual constituents of a product, produced by the use of chemicals, furnishes the best evidence of the character of the product.

Other conditions being favorable, it has become the established practice of the Commissioner to grant extensions of patents having only such defects as may be corrected by reissue.

THACHER, *Acting Commissioner:*

This invention consists in the application of antiseptics to canvas to be coated with vulcanized rubber and formed into hose. The object is to produce a combined rubber and canvas hose that will be durable.

After rubber hose came into use and began to supersede the old leather article, it was found that the canvas, upon which its strength depended, soon decayed, and that it consequently burst under the pressure necessary to its use. Mr. Mayall sought to overcome this objection to rubber hose, which was otherwise very desirable, and in 1859, as the result of a series of experiments, he made the hose upon which his application for patent was based. He had no knowledge of chemistry, and did not understand scientifically the causes or conditions of the decay of canvas in hose, or the *rationale* of its prevention. He does not even now know the chemical properties of the ingredients he employed or mentioned in his patent, or the nature of their action under the conditions of the formation of vulcanized-rubber hose.

It becomes important, therefore, to scrutinize the testimony in this case with great care to determine what was actually done by Mayall. Relying upon the uncontradicted expert testimony of the remonstrants, with respect to the four substances expressly named in the patent, I am brought to the conclusion that, as it now stands, the patent could not properly be extended; for these substances—viz., "corrosive sublimate," "chloride of zinc," "pyrolignite of iron," and "oil of tar"—although generally known as antiseptics, are, according to the testimony, so inefficient, under the conditions prescribed for making antiseptic hose, as to render the patent practically worthless.

But it appears that Mayall actually did procure from Durant, and actually did use, *dead oil of tar*. This is virtually conceded by the opponents to the extension. A bottle, sworn by Mayall to contain some of the very liquid used in treating the specimen of hose filed in the Patent Office with his application for a patent, and also its companion piece, Exhibit 1, was produced, and put into the case as Exhibit 3. The contents were examined by Prof. Morton, expert witness for remonstrants, who subsequently testified that it was his impression the bottle contained dead oil. One of the elements of dead oil is carbolic acid; in fact, the substance itself, according to the testimony of the expert, Prof. Chandler, in this and in a former case in the Patent Office, is known as crude carbolic acid, and the value and efficiency of *this* antiseptic, as applied to the manufacture of hose, is unquestioned. But while it is proved that Mayall *used* "dead oil of tar," he fails to mention it specifically in his patent, naming, as one of his antiseptic agents, simply "oil of tar," which phrase is shown by remonstrants to be limited in commercial language to the vegetable product, which is also proved by them to be worthless for the purpose proposed.

If, however, Mayall actually made antiseptic hose, and used in the process "dead oil of tar," the question arises whether his patent cannot now be reissued, so as to include this latter substance. Now, it is not at all material that he was at the date of his experiments, and is now, in total ignorance of the scientific nature of what he employed or of what he did. The *result* was what he sought and what, from the tests he applied, he was conscious that he had attained, when he ceased his experiments, took his product to his solicitor, and directed him to take out a patent. Nor is it of the least consequence that, apparently groping blindly, (saving a few inquiries of scientific persons,) by mere accident he hit upon the means and accomplished the end sought. There is no doubt about what he was *seeking* to do; and this circumstance that he was working with an intelligent purpose, removes the case from the category of accidents to which reference is made in *Ransom* vs. *Mayor of New York*. The only question is, What did he actually produce?

Now, it is shown that he used "dead oil of tar." It is also the fact that *apparently* the Patent Office specimen and Exhibit 1 are pieces of antiseptic hose, as both appear to be well preserved. Whether or not these specimens are what is now called "carbolized hose," formed by the use of carbolic acid, is not the point at issue. Did Mayall actually make an antiseptic hose which was a new product in 1859? That is the question to be determined. Patents have since been granted to other parties expressly covering carbolized hose, and it is not necessary or proper to try the question of infringement here, especially since it is now pending in court. Mayall's invention must be confined necessarily to the substances he actually used and their equivalents; but it is not necessary to the present discussion to determine what are equivalents. If a just test of the constituents of Exhibit 1 had been made by the remonstrants, it would have been the simplest, the most direct, and the most conclusive evidence that could have been presented. If the canvas of which it was composed had not been found to have been treated successfully with an antiseptic, the fact, in connection with the expert testimony filed, would have been necessarily decisive against the validity of the patent under any circumstances. But the expert testimony of remonstrants does not directly deny that Mayall made an antiseptic hose. It merely details *ex parte* experiments which tend to show that the antiseptics mentioned in the patent cannot be employed successfully for that purpose. Whether in the absence of anything to the contrary they would conclusively show this or not, it is unnecessary for me to determine, in view of the fact that the Office specimen and Exhibit 1 are apparently, and sworn to be, specimens of antiseptic-hose, and, although easily capable of being proved not to be, if they are not, it is not directly done or attempted. The conclusion upon the weight of evidence is incontestibly in favor of the applicant that he did actually make an invention, consisting in the treatment of canvas for hose with "dead oil of tar," and did suppose that he thereby obtained an antiseptic product.

The law relating to the correction of patents by reissue provides that "no new matter shall be introduced into the specification, nor, in case of a machine-patent, shall the model or drawings be amended, except each by the other; but when there is neither model nor drawing, amendments may be made upon proof satisfactory to the Commissioner that such new matter or amendment was a part of the original invention, and was omitted from the specification by inadvertence, accident, or mistake, as aforesaid." (Section 53, 1870.)

Although there is found in this case what is called a model, it is not such in the sense in which the term is used in connection with mechanical patents. The patent of Mayall is a chemical-process patent, and the so-called model is simply a specimen of the product, and is not in any sense an illustration of the mechanism used in conducting the process. The patent is, therefore, undoubtedly within the provision of the last clause quoted above, and may be reissued to include and cover any antiseptic satisfactorily proved to have been used by Mayall in perfecting his invention.

Other conditions being favorable, it has become the established practice of the Commissioner to grant extensions, where there are only such defects as may be corrected by reissue. It only remains, then, to dispose of the other points in the case, upon which much less stress has been laid by the contestants.

Upon the question of reasonable diligence on the part of the patentee, the remonstrants rely on the statement that no hose has been manufactured by him, or by any one else, by the use of any of the antiseptics specified in the patent. The pending suit, however, will determine whether or not equivalents have been employed in the extensive manufacture of antiseptic hose that has taken place during the later years of the term of the patent; and upon that it is not necessary to decide here. But there is evidence in the testimony of Murphy to indicate that alleged infringers themselves have not been wholly free from misgiving on this point. It appears that Mayall was reasonably diligent up to the date of assignment of his patent in 1861, after which he was not personally responsible for the introduction of his invention. Since the close of the war the Boston and New York companies licensed under the patent have been engaged in manufacturing carbolized hose, assuming the license a sufficient warrant for their manufacture. I do not think, therefore, that it can justly be held either that the invention of Mayall has never been practiced or that he has been culpably negligent in efforts to introduce it into use.

The great value of antiseptic hose, of which appli-

cant is apparently the inventor, whatever may be the defects of his patent, is conceded, and the inadequacy of his remuneration is apparent. I conclude, therefore, that it is proper the extension he asks should be granted.

APPLICATIONS FOR EXTENSION.

Applications having been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

26,674.—Clothes-Driers.—Granted to B. B. HAWES, January 3, 1860. Application filed October 3, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,679.—Double-Seaming Machines.—Granted to LESTER T. HULBERT, January 3, 1860. Application filed September 29, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,689.—Pivot-Bearings.—Granted to FRANCIS C. LOWTHROP, January 3, 1860. Application filed October 6, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,785.—Waste-Cocks of Hydrants.—Granted to GEORGE W. ROBERTSON, January 10, 1860. Application filed October 3, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,806.—Manufacture of Boots and Shoes.—Granted to FRANCIS D. BALLOU, January 10, 1860, and reissued April 10, 1869. Application filed October 4, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,822.—Tool for Cutting Round Tenons.—Granted to LEVI A. DOLE, January 10, 1860. Application filed September 30, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,860.—Machines for the Manufacture of Tinware, granted to SAMUEL J. OLMSTED, January 17, 1860. Application filed October 16, 1873. Testimony closes December 16, 1873. Hearing December 31, 1873.

26,891.—Catches for Spectacle-Cases.—Granted to GEORGE H. CUMMINGS, January 24, 1869. Application filed September 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,902.—Planing-Machines.—Granted to SOLOMON S. GRAY, January 24, 1860. Application filed October 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,906.—Stitches.—Granted to ALBERT F. JOHNSON, January 24, 1860. Application filed October 25, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,914.—Clothes-Wringers.—Granted to ROBERT O. MELDRUM and AMOS B. PAXSON, January 24, 1860. Application filed October 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,919.—Repeating Fire-Arms.—Granted to WILLIAM H. MORRIS and CHARLES L. BROWN, January 24, 1860, and reissued August 7, 1871. Application filed October 23, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,942.—Seats and Couches for Railroad-Cars.—Granted to THEODORE T. WOODRUFF, January 24, 1860. Application filed October 25, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,948.—Sewing-Machines.—Granted to ALBERT F. JOHNSON, January 24, 1860. Application filed October 24, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,952.—Lamps, granted to GEORGE NEILSON, January 24, 1860. Application filed October 18, 1873. Testimony closed December 23, 1873. Hearing January 7, 1874.

27,008.—Machines for Attaching and Finishing Boot-Heels.—Granted to HERMAN SALOMINSKY, January 31, 1860, and reissued March 28, 1867. Application filed October 28, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,020.—Variable Exhaust-Pipe for Steam-Engines.—Granted to GEORGE EDWARDS, January 31, 1860. Application filed November 1, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,023.—Calendar-Clocks.—Granted to EUGENE M. MIX and JAMES E. MIX, January 31, 1860. Application filed October 31, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,034.—Harvesters.—Granted to JOHN BUTTER, February 7, 1860; and reissued June 13, 1871. Application filed November 4, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,043.—Lock for Umbrella-Stands.—Granted to ALFRED M. FOOTE, February 7, 1860. Application filed November 8, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,065.—Coffee-Mills.—Granted to JOHN and EDMUND PARKER, February 7, 1860. Application filed October 9, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,094.—Machine for Making Cartridge-Cases.—Granted to ETHAN ALLEN, February 14, 1860, and reissued May 9, 1865, in two divisions, numbered, respectively, 1,948 and 1,949. Application filed November 11, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,135.—Sugar-Cutters.—Granted to CHARLES KIESLER and WILHELM ROSEBROCK, February 14, 1860. Application filed November 13, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,139.—Hanging Rudders.—Granted to JOSEPH P. MANTON and HENRY A. BILLINGS, February 14, 1860. Application filed November 10, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,179.—Marking-Gages for Sewing-Machines.—Granted to CALVIN D. WHEELER, February 14, 1860. Application filed November 14, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,185.—Soldering-Irons.—Granted to ABNER BURBANK, February 4, 1860. Application filed November 8, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,241.—Photographic Cameras.—Granted to AUGUST SEMMENDINGER, February 21, 1860. Application filed November 20, 1873. Testimony closes January 20, 1874. Hearing February 4, 1874.

27,291.—Seed-Planters.—Granted to JOHN S. HUGGINS, February 28, 1860. Application filed November 24, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,297.—Couches for Railroad-Cars.—Granted to EDWARD C. KNIGHT, February 28, 1860. Application filed November 29, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,303.—Fastening Saw-Handles.—Granted to JACOB NEIMEYER, February 28, 1860. Application filed November 28, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,319.—Machine for Bending Sheet Metal.—Granted to ORSON W. STOW, February 28, 1860; and reissued August 4, 1868. Application filed October 29, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,357.—Table-Cutlery.—Granted to JOSEPH W. GARDNER, March 6, 1860. Application filed December 3, 1873. Testimony closes February 3, 1874. Hearing February 18, 1874.

27,392.—Machine for Folding and Pasting Paper.—Granted to GEORGE K. SNOW, March 6, 1860. Application filed December 3, 1873. Testimony closes February 3, 1874. Hearing February 18, 1874.

27,403.—Steam and Fire Regulators.—Granted to JOSEPH WOODRUFF, March 6, 1860. Application filed December 5, 1873. Testimony closes February 3, 1874. Hearing February 18, 1874.

27,406.—Cultivators.—Granted to ROBERT CRAIG, March 6, 1860. Application filed November 22, 1873. Testimony closes February 3, 1874. Hearing February 18, 1874.

27,456.—Machines for Covering the Springs of Skeleton Skirts.—Granted to JOHN T. LOVE, March 13, 1860. Application filed October 6, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

30,467.—Apparatus for Singeing Pigs.—Granted to ABRAHAM and EDWARD M. DENNY, October 23, 1860. Patented in England February 2, 1860. Application filed October 17, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

31,262.—Pare-Boxes.—Granted to JOHN B. SLAWSON, January 29, 1861. Patented in England January 16, 1860. Application filed October 7, 1873. Testimony closes December 16, 1873. Hearing December 31, 1873.

EXTENSIONS GRANTED.

26,339.—Improvement in Water-Wheels, granted to JAMES P. COLLINS, December 6, 1859; reissued June 12, 1860, numbered 979; again reissued May 13, 1873, numbered 5,407.

Claim.—1. A water-wheel provided with annularly-arranged buckets and a central covering box or cap, in combination with a disk or lifting plate for relieving or counteracting the weight or pressure of the water on the buckets, substantially as described.

2. The ring or flange *a* interposed between the stationary guide and the wheel for preventing access of the water to, and its consequent pressure upon, the center of the wheel, substantially as and for the purpose specified.

3. The combination, with a water-wheel provided with annularly-arranged buckets, as described, of a lifting-plate for counteracting the weight of the water on the buckets, and a ring or flange interposed between the wheel and the stationary guide-box or cap for preventing the ingress of water between said wheel and guide-box or cap, as described.

4. The packing-ring *c* fitted within a recess or groove surrounding the wheel, and adapted to move laterally to compensate for wear or irregularities in the movement of the wheel, as described.

DISCLAIMERS FILED.

143,201.—JAMES E. THOMAS, Buffalo, N. Y.—Improvement in Seal-Locks.—Patent dated September 23, 1873. Disclaims:

"That part of the second claim in said specification, which is in the following words, to wit: 'and shoulder *f*.'"

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date December 2, 1873.]

7,005.—Buckle.—JOSEPH R. SMITH, Waterbury, Conn., assignor to THE WATERBURY BUTTON COMPANY, same place. Application filed October 11, 1873. Term of patent 7 years.

7,006.—Pencil-Case.—EDWARD TODD, Brooklyn, N. Y. Application filed November 1, 1873. Term of patent 3½ years.

7,007.—Cooking-Stove.—NICHOLAS S. VEDDER and FRANCIS RITCHIE, Troy, N. Y., assignors to NICHOLAS S. VEDDER, same place. Application filed September 12, 1873. Term of patent 3½ years.

7,008.—Cooking-Stove.—NICHOLAS S. VEDDER, Troy, and TOBIAS S. HEISTER, Lansingburg, assignors to NICHOLAS S. VEDDER, Troy, N. Y. Application filed September 12, 1873. Term of patent 3½ years.

7,009.—Cooking-Stove.—NICHOLAS S. VEDDER, Troy, and TOBIAS S. HEISTER, Lansingburg, assignors to NICHOLAS S. VEDDER, Troy, N. Y. Application filed September 12, 1873. Term of patent 3½ years.

7,010.—Cooking-Stove.—NICHOLAS S. VEDDER, Troy, and TOBIAS S. HEISTER, Lansingburg, assignors to NICHOLAS S. VEDDER, Troy, N. Y. Application filed September 12, 1873. Term of patent 3½ years.

7,011.—Box-Stove.—NICHOLAS S. VEDDER, Troy, and TOBIAS S. HEISTER, Lansingburg, assignors to NICHOLAS S. VEDDER, Troy, N. Y. Application filed September 12, 1873. Term of patent 7 years.

7,012.—Base-Burning Stove.—NICHOLAS S. VEDDER, Troy, and TOBIAS S. HEISTER, Lansingburg, assignors to NICHOLAS S. VEDDER, Troy, N. Y. Application filed September 12, 1873. Term of patent 7 years.

7,013.—Parlor-Stove.—NICHOLAS S. VEDDER, Troy, and TOBIAS S. HEISTER, Lansingburg, assignors to NICHOLAS S. VEDDER, Troy, N. Y. Application filed September 12, 1873. Term of patent 7 years.

7,014.—Heating-Stove.—NICHOLAS S. VEDDER and FRANCIS RITCHIE, Troy, and TOBIAS S. HEISTER, Lansingburg, assignors to NICHOLAS S. VEDDER, Troy, N. Y. Application filed September 12, 1873. Term of patent 7 years.

7,015.—Clock-Case.—GILBERT H. BLAKESLEY, Bristol, Conn. Application filed November 8, 1873. Term of patent 14 years.

7,016.—Group of Statuary.—JOHN ROGERS, New York, N. Y. Application filed November 26, 1873. Term of patent 14 years.

7,017.—Fan.—WILLIAM A. SMITH, Niagara Falls, N. Y. Application filed September 6, 1873. Term of patent 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date December 2, 1873.]

1,545.—Dry Goods.—EMERY, IVES & LEE, New York, N. Y. Application filed October 25, 1873.
"A sphinx."

1,546.—Hardware, Cutlery, Guns, Pistols, and Lead-Pencils.—THEOPHILUS HASSENBUCH, Philadelphia, Pa. Application filed November 13, 1873.
"a dancing-bear with staff."

1,547.—Watches.—THE NATIONAL WATCH COMPANY, Elgin, Ill.—Case 2. Application filed November 22, 1873.
"'H. Z. Culver.'"

1,548.—Watches.—THE NATIONAL WATCH COMPANY, Elgin, Ill.—Case 3. Application filed November 22, 1873.
"'H. H. Taylor.'"

1,549.—Watches.—THE NATIONAL WATCH COMPANY, Elgin, Ill.—Case 4. Application filed November 22, 1873.
"'G. M. Wheeler.'"

1,550.—Watches.—THE NATIONAL WATCH COMPANY, Elgin, Ill.—Case 5. Application filed November 22, 1873.
"'Mat Laflin.'"

1,551.—Watches.—THE NATIONAL WATCH COMPANY, Elgin, Ill.—Case 6. Application filed November 22, 1873.
"'J. T. Ryerson.'"

1,552.—Watches.—THE NATIONAL WATCH COMPANY, Elgin, Ill.—Case 7. Application filed November 22, 1873.
"'Lady Elgin.'"

1,553.—Watches.—THE NATIONAL WATCH COMPANY, Elgin, Ill.—Case 8. Application filed November 22, 1873.
"'W. H. Ferry.'"

1,554.—Watches.—THE NATIONAL WATCH COMPANY, Elgin, Ill.—Case 9. Application filed November 22, 1873.
"'M. D. Ogden.'"

1,555.—Watches.—THE NATIONAL WATCH COMPANY, Elgin, Ill.—Case 10. Application filed November 22, 1873.
"'Gail Borden.'"

1,556.—Watches.—THE NATIONAL WATCH COMPANY, Elgin, Ill.—Case 11. Application filed November 22, 1873.
"'Frances Rubie.'"

1,557.—Watches.—THE NATIONAL WATCH COMPANY, Elgin, Ill.—Case 12. Application filed November 22, 1873.
"'Dexter St.'"

1,558.—Watches.—THE NATIONAL WATCH COMPANY, Elgin, Ill.—Case 13. Application filed November 22, 1873.
"'Chas. Fargo.'"

1,559.—Watches.—THE NATIONAL WATCH COMPANY, Elgin, Ill.—Case 14. Application filed November 22, 1873.
"'National Watch Co.'"

1,560.—Watches.—THE NATIONAL WATCH COMPANY, Elgin, Ill.—Case 15. Application filed November 22, 1873.
"'Elgin Watch Co.'"

1,561.—Watches.—THE NATIONAL WATCH COMPANY, Elgin, Ill.—Case 16. Application filed November 22, 1873.
"'Chicago Watch Co.'"

1,562.—Watches.—THE NATIONAL WATCH COMPANY, Elgin, Ill.—Case 17. Application filed November 22, 1873.
"'The Chicago Watch.'"

1,862.—Liniment.—ISADORE VALLIER, New York, N. Y. Application filed November 17, 1873.

"'Vallier's French Liniment,' with the figures of an infirm and a cured man, inscriptions, and autograph."

1,864.—Medical Compound for Rheumatism.—MOYER & Co., Philadelphia, Pa. Application filed November 18, 1873.

"'Highland Rheumatic Remedy,' and the figure of a 'Highland Chief.'"

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date December 2, 1873.]

ORIGINAL PATENTS.

145,042.—Dish-Washer.—CHARLES BARTLETT, Providence, R. I. Application filed September, 20, 1873.

A handle has a large recess at one end, into which an eye-bolt is inserted and held by a screw and nut.

Claim.—The combination, in a dish-washer, as shown and described, of the recessed handle A, eye-bolt B, and nut C, as and for the purpose specified.

145,043.—Harness-Whiffletree.—CHAUNCEY T. BEECHER, Bethany, Conn. Application filed May 5, 1871.

Claim.—The combination of the whiffletrees *b*, having rings *c* and central bolt, with the double-trees, and the universally-jointed hook or link *x*, substantially as described.

145,044.—Concave for Thrashing-Machines.—LEWIS C. BECKMAN, Norristown, Pa. Application filed August 19, 1873.

The grooves increase in depth from front to rear, and both ribs and grooves have their surfaces smooth.

Claim.—The metal concave A, furnished in the same solid piece, with rectangular and parallel grooves B, made transversely across the concave, having the sides of the partitions and the curved top or roof of each of said grooves made smooth and even upon their surfaces, and also having the base of each such partition inclined in a straight plane from the feeding side of the concave at *f* to the discharging one at *g*, so as to form a diverging angle from its point of contact with the curved roof of each adjacent groove, until it meets the other end of the said partition, and thus causing said grooves to grow gradually deeper toward the said discharging end, said construction made, arranged, adjusted above the thrashing-cylinder C, and operated upon substantially in the manner and for the purposes herewith shown and described.

145,045.—Treating Horn to Resemble Whalebone.—WILLIAM BIRCH, Walworth, Great Britain, assignor of one-half his right to CHARLES L. TEMPLE, Chester, Pa. Application filed November 8, 1873.

An infusion or decoction of sage is made by steeping in water sage-leaves and adding potash. The horny substance is placed into a perforated vessel, (which is capable of being lifted in and out of the close boiler,) and when sufficiently soft they are rolled while hot.

Claim.—Subjecting horny substances to a combination of chemical and mechanical processes for the purpose of first softening and then pressing, consolidating, rolling out, or otherwise treating the same, as and for the purposes and in the manner herein set forth.

145,046.—Wagon-Jack.—MARTIN BUCK, North Rush, N. Y. Application filed October 16, 1873.

Claim.—The combination of the base A, standard B, and lever or handle C, with the coil-spring E, loop D, cross-bar *p*, shanks *l l'*, and studs *t t t t*, as substantially herein described and specified.

145,047.—Medical Compound for Treating Horses' Hoofs, &c.—JOSEPH C. BURROUGHS, Clinton, Mich. Application filed July 11, 1873.

Lard, sugar, bees-wax, resin, mutton-tallow, verdigris, new linseed-oil, turpentine.

Claim.—The ointment or medical compound above described, composed of the ingredients specified, and compounded in the proportions and in the manner substantially as set forth.

145,048.—Bee-Hive.—DAVID MCC. CALVIN, East Fallowfield, Pa. Application filed September 27, 1873.

An improvement on the hive patented to same inventor April 8, 1873.

Claim.—The combs so made that when secured together they form the top and two sides of the hive, tapering from the bottom to the top, which, in combination with the sides D D and the rods E E, or their equivalents, complete the hive, substantially in the manner and for the purpose specified.

145,049.—Extension-Table.—AARON F. CHUBBUCK, Canandaigua, Mich. Application filed October 10, 1873.

One of the end bars of the lazy-tongs is pivoted to the under side of the table, and the other bar has a friction-roller on its free end, which runs in a straight groove in the under side of the table. Studs project upward from said bar and engage with the groove in a curved plate, also attached to the under side of the table. The "lazy-tongs" are operated by a lever attached at one end.

Claim.—1. The combination, in an extension-table, of a curved grooved plate, *d*, with the lazy-tongs E, provided with studs *h*, arranged and operating to prevent the sagging of the lazy-tongs, substantially as shown and described.

2. The combination, in an extension-table, of the lazy-tongs E, having the studs *h*, friction-roller *a*, and handle G, with the table A, provided with grooves *b* and plate *d*, all arranged and operating to readily effect the adjustment of the table by a single person, substantially as set forth.

145,050.—Harvester.—EDWARD H. CLINTON, Iowa City, Iowa. Application filed October 20, 1873.

The cut grain, which falls upon the horizontal platform, is moved, by a reciprocating rake, which operates beneath the platform, to the top of the elevator, where it is dropped upon a grain-receiver.

Claim.—1. The pinion-wheel F and bevel-wheel E on the shaft which carries the device which reciprocates the sickle, and are geared with the traction-wheel shaft, in combination with the bevel-wheel S^2, vertical shaft S^3, clutch S^4, bevel-wheels S S^1, sprocket-pulley r^3, and endless chain O, which carries the grain-elevating rake, substantially as and for the purpose described.

2. The vibrating reciprocating toothed rake M, endless chain O, horizontal and inclined grain-platforms B B, pivoted lifting-lever Q, cam *o*, catch *p*, spring-trip P, constructed, arranged, combined, and operating substantially in the manner herein described and shown.

3. The cam-extension *o* of the rake, slide N, and pivoted lifting-lever Q, combined, for the purpose described.

4. The spring-trip P, in combination with the cam *s* of the spring-catch *p*, arranged and operating as described.

145,051.—Dental Plugger.—JOHN T. CODMAN, Boston, Mass. Application filed November 12, 1873.

The pressing-point of the tool is at right angles to the shank, and the shank itself is a trip-lever, the inner end of which lies within a hollow handle, and is operated by a rotary cam and spring. Combined with this lever-arm is a fixed arm, which, being held against the filling, forms a guide and rest in directing the lever-point in its action.

Claim.—1. A dental plugger having the lever *c*, with its bent plugger-point *b*, said lever being operated by the cam *q* and spring *o*, or equivalent mechanism, substantially as shown and described.

2. In combination with the lever-arm *c*, the fixed arm *d*, substantially as shown and described.

145,052.—Machine for Shearing Hats.—RICHARD COOKE, New Hartford, N. Y. Application filed April 10, 1873.

Claim.—1. The two overhung or projecting revolving shears B B', and two corresponding leger-knives, *b b'*, arranged to operate relatively to each other and to a hat-brim passed between them, substantially as and for the purposes herein set forth.

2. The two leger-knives *b* and D, arranged, as shown, relatively to the same revolving shear B, so that one, *b*, is available in shearing both sides of the brim, and, on changing the position of the hat, the other, D, becomes available for shearing the crown and tip.

3. The smooth casing C, arranged on a projecting revolving shear, B, and adapted to serve therewith in shearing into the angle between the brim and crown of hats, as specified.

4. The combination, in a single organized machine, of the two revolving shears B B' and corresponding leger-knives *b b'*, with the additional leger-knife D, mounted on the opposite side of one of the revolving shears, as and for the purposes specified.

5. The projecting supporting-bar E, combined and arranged to operate with the revolving shear B, casing C, and leger-knife D, as herein specified.

145,053.—Drop-Light for Chandeliers.—CHARLES E. CORNELIUS, Philadelphia, Pa. Application filed February 26, 1873.

The spring and its drum and cord which sustains the drop-light are concealed in the canopy and casing of the chandelier. A central pipe conveys gas to the drop-light burner. Between this central pipe and a concentric pipe next outside of it the tube and cords which sustain the drop-light traverse perpendicularly. Between the second above-named pipe and the outer casing the gas passes to the main burners of the chandelier.

Claim.—1. In combination with the canopy and main pipe of a chandelier, the spring-box and drum concealed within the canopy, and the cord concealed within the main pipe of the chandelier, as hereinbefore described.

2. The concentric pipes G and H, forming between them an annular space for the reception and concealment of the sliding pipe I, and of the cord which descends from the spring-box and drum located within the canopy above, and connects with the sliding pipe.

3. The sliding pipe I, in connection and combination with the cord which descends from the spring-box and drum within the canopy, and passes through the annular space formed by the concentric arrangement of the pipes G and H.

145,054.—Stove for Smoke-Houses.—ISAAC M. DEARDORFF, Canal Dover, Ohio. Application filed July 9, 1873.

The dampers, one below the grate and the other above the fire, prevent excessive draft.

Claim.—A smoke-producing stove provided with the grate B, regulated by the grated dampers *d d*, and the inner perforated partition-plate D in its upper part, regulated by a damper or dampers A A, as described, whereby the draft and combustion are so regulated as to give out the least heat and the greatest amount of smoke, as required, substantially as herein specified.

145,055.—Shaft for Vehicles.—JOHN J. DEWEY, Quechee, Vt. Application filed September 29, 1873.

Claim.—The sliding joints *c d*, placed between the straight and curved portions of the thills, so as to form a rigid connection, all combined substantially as and for the purpose set forth.

145,056.—Manufacture of Crimped Hair.—RODNEY F. DONNETHORPE and THOMAS A. W. CLARKE, Leicester, England. Application filed June 25, 1873.

As the roving of hair passes out of the opening of the tube the cord is twisted around it from the revolving bobbins.

Claim.—1. The improvement in the art of manufacturing crimped hair, consisting in plaiting the hair from a continuous roving, substantially as before set forth, whereby all the hair, including the ends, is crimped with uniformity.

2. The combination, with a tube, *l*, through which a roving of hair is led, of pinions g^2 g^3, giving motion to arms *r*, which have mounted upon them bobbins A, holding cords or wires, substantially as described, and for the purpose set forth.

145,057.—Railway Time-Signal.—JACOB FEHD and JOHN W. STEVENSON, Johnstown, Pa. Application filed June 23, 1873.

The hands of a railway time-signal are turned back to the starting-point by means of yielding connections with a lever operated by a passing train.

Claim.—1. The toothed wheels C and D, the latter carrying the springs c^2, having the lugs *o o'*, in combination with the disk F, having lugs *e* and *d'*, and disk G, having lug *d* and notch *c'*, the said disks being connected with the hands of the clock, and arranged substantially as described.

2. The above-described combination, arranged to be operated by a lever and pitman having yielding connections, for preventing sudden strain, and actuated by the passing train, substantially as shown and described.

145,058.—Dental Forceps.—CYRUS G. FRENCH, Springfield, Ill. Application filed October 22, 1873.

Claim.—The above-described dental forceps, having a conical screw on the end of one of the beaks, a cam acting as a fulcrum in the joint, a slot in which the pin or screw is put to connect the two parts of the forceps, and the recess or notch behind the joint for the cam to rest in, as substantially shown and described.

145,059.—Feed-Water Heater.—JOHN H. HALE and ALFRED C. WHITNEY, Boston, Mass. Application filed October 30, 1873.

Water is forced through the coil located in the combustion-chamber, and heated by the products of combustion on their way to the chimney. The coil is provided with a pipe to keep up a circulation from the boiler, and prevent burning should the pump become disarranged.

Claim.—The combination of a boiler, *a*, smoke-box *c*, chimney *d*, the spirally-wound tapering feed-pipe *e*, check-valve *f*, connecting-pipes *g*, stop-valve *h*, regulating-pipe *i*, and the stop-valve *k*, when combined and arranged substantially as herein shown and described.

145,060.—Machine for "Heading" Hair.—EMMA HOUGH, Brooklyn, N. Y. Application filed November 7, 1873.

A machine for arranging the root-ends of hair. The hair is placed upon the bed-plate under the vibrating heading-plate, which, as it rubs the hairs back and forth, comes against their barbed surfaces and pushes them out head first on either side, where they are caught by the combs upon the revolving belt and carried out.

Claim.—1. In a hair-heading machine, the combination of a self-adjustable vibrating heading-plate, E, with the slotted rock-shaft U, connecting-rod I, cam J, shaft V, substantially as described.

2. In a hair-heading machine, the combination of a self-adjustable vibrating heading-plate, E, with the bed F and elastic rubber G, substantially as described.

3. In a hair-heading machine, the combination of the two opposite-revolving comb or card-belts K and L with the bed H, with its elastic rubber surface G and self-adjustable vibrating heading-plate E, substantially as described.

4. In a hair-heading machine, the two opposite-revolving comb or card belts K and L, in combination with the cog-wheels R and S, worms T and U, and horizontal shaft V, substantially as described.

145,061.—Heel-Breasting Machine.—AUDISON B. JAQUITH and JAMES WOLOHAN, Rochester, N. Y., assignors of one-third their right to ELBRIDGE A. JAQUITH, same place. Application filed March 17, 1873.

The standard or last-holder is made adjustable, and held rigidly in position at any desired inclination by a single set-screw.

Claim.—The pivoted stock B, with its arm C and adjusting-screw *c*, in combination with the sliding base A in fastening machines, when the said stock is constructed to receive and retain the last D rigidly in its desired position or adjustment, substantially in the manner and for the purposes shown and described.

145,062.—Medical Compound or Bitters.—LEWIS KIRTLAN, Woodstock, Ill. Application filed November 4, 1873.

Agaric or touchwood, elecampane, valerary root, gentian, arum or dragon root, rhubarb or rhubarb, Agnostinum levisticum or lovage, glycyrrhiza or liquorice, castoreum, theobroma or theobroma.

Claim.—The herein-described medical compound, composed of the ingredients, and substantially in the proportions herein set forth.

145,063.—Churn-Machine.—FRANKLIN LOCKHART, Cleveland, Ohio. Application filed October 24, 1872.

The improvement on his former patent of July 8, 1873, consists in connecting the arms B by means of the link C, to cause said arms to move equally at the same time. The pillow-block T is provided for the purpose of keeping one end of the link higher than the other, while an adjustable gage, Y, gages the link to be lapped by the rollers. The dies *c' d* are made wider than they are deep to provide for the expansion of the metal.

Claim.—1. The link C and spring D', in combination with the arms B B, in the manner substantially as described, and for the purpose specified.

2. The pillow-block T, arranged in relation to link in combination with, the rollers *c b* and arms J K, in the manner as and for the purpose set forth.

3. The gage V, as arranged in relation to the standard I, rollers *a b*, and arms J K, for the purpose specified.

4. The dies or points *c' d* of the hammer and block, constructed as described, and co-operating in the manner substantially as set forth, for the purpose specified.

145,064.—Telegraph Cut-Out.—WILLIAM G. LEE, Bloomfield, Iowa. Application filed April 21, 1873.

Central revolving disk, with a metallic raised rim divided into two equal parts by insulating-spaces. Disk revolved in one direction connects B to E and F to B', cutting the office out; reversing, connects B to B' and E to F.

Claim.—The movable disk with its separated conducting-strips, combined with the conducting-arms B E F B', substantially as described.

145,065.—Chemical Compound for Cleaning Jewelry, Diamonds, &c.—AUGUSTUS H. LONGLEY and EDWARD R. STICKNEY, Springfield, Mass. Application filed October 30, 1873.

Alcohol, benzine, (rectified,) oil of citronella, oil of verbena, oil of bergamot, ammonia water, salt, saltpeter, alum, borax, palm soap, pure water.

Claim.—A compound composed of the ingredients in about the proportions herein set forth.

145,066.—Refrigerator.—JACOB LORENZ and HENRY F. W. BENDER, Hamilton, Ohio. Application filed May 29, 1873.

Claim.—1. The arrangement of the metal cylinder-tubes *a a*, recess D, and openings *x x*, in relation to each other, and the outer casing *a* and zinc lining *b*, substantially as described, for the purpose specified.

2. The arrangement of the water-pipe *e* within the air-induction-tube *n*, to aid in cooling the inflowing air, substantially as and for the purpose specified.

145,067.—Car-Coupling.—JAMES C. MALOY, Johnstown, Pa. Application filed November 20, 1873.

When the buffer *c* is forced back so as to drop the pin, by means of a lever, *g*, having hooks *i*, a pair of springs are compressed against the link so as to guide it into an opposing draw-head.

Claim.—The combination, in the draw-head *a*, of the sliding collar *b*, buffer *c*, lever *g*, hooks *i*, and springs *l*, substantially as shown and described.

145,068.—Combined Ruler and Blotter.—THOMAS MERRILL, Portland, Me. Application filed September 1, 1873.

Claim.—The combination of the blotting-rule A, blotting-roller B, side pieces C, tongue G, and teeth F, for the purposes set forth.

145,069.—Sink.—HENRY MILLER, Johnston, R. I., assignor to GEORGE MILLER, HENRY MILLER, and ALFRED A. BROWN, same place. Application filed July 21, 1873.

The basin is constructed with thick hubs for the reception of screws which pass into but not through them to secure the strainer, and with lugs on the outside of the basin for securing the waste-pipe, so that they may be removed independent of each other.

Claim.—The funnel or basin F, constructed with thick hubs F', and with lugs H on the outside, substantially as shown and described.

145,070.—Stem Winding and Setting Watch.—ULYSSE NARDIN, Locle, Switzerland. Application filed October 17, 1873.

When the watch is closed the stem is engaged for winding; when the bank is opened a spring is released which automatically shifts the engagement from the winding to the setting mechanism. Said spring may be locked out of action.

Claim.—1. The combination of the spring H, having beveled piece H', and levers G and F, with the spring-clutch, all arranged substantially as shown and described.

2. The slide S, having stud T, passing through a slot in the center or rim K, in combination with the spring H, substantially as set forth.

145,071.—Head-Comb.—DAVID N. ROPER, Orange, N. J., assignor to THE INDIA-RUBBER COMB COMPANY, College Point, N. Y. Application filed October 1, 1873.

Claim.—In combination with a head-comb, the detachable vertical ornament secured and adjusted substantially by means such as herein before described, so that one ornament may be removed and another substituted at will, as set forth.

145,072.—Machine for Bending Chain-Links.—DANIEL ROY, Millcreek township, Erie county, Pa., assignor of one-half his right to SAMUEL S. CAUGHEY, same place. Application filed April 11, 1873.

The recesses *b* in the table, over which the rod is placed, are oblique to the axis of the table. The forming-jaws F are the concaved ends of two levers E pivoted to the frame, and the mandrel C is on arm projecting from a crank-shaft. The mandrel in its revolution strikes the blank and forces it down between the jaws, and the latter are then forced to turn on their pivots, by which they gradually bend the rod around the mandrel.

Claim.—The combination, substantially as herein shown, of the mandrel C, jaw-plates B B with diagonal jaws *b b*, and the clamps F F, all arranged and operating together substantially as and for the purposes shown.

145,073.—Clasp for Elastic Bands.—ROBERT B. STAATS, New York, N. Y., assignor to himself and FRANK A. STOUT, same place. Application filed April 18, 1873.

Claim.—The spring-wedge *c*, in combination with the case *a*, having the teeth *b* at the ends bent inwardly, as and for the purpose set forth.

145,074.—Clasp for Supporting Stockings, &c.—JAMES R. TREAT, Boston, Mass. Application filed April 26, 1873.

Claim.—In combination with the concave plate *c*, having a lip, *d*, in its lower end, the tongue-plate *e f*, hinged at *g*, and to the upper end of the plate *c*, the whole forming a buckle, as and for the purpose set forth.

145,075.—Spherical Gear or Universal Joint.—THEOPHILUS WEAVER, Harrisburg, Pa. Application filed May 16, 1873.

The spherical spindles are right-sphere joints. The ball B is solid or shell-formed, and has groove Q on the maximeter score to receive the stiles S of the male or its projecting shaft, to resist lateral strain thereby. It has trunnions K projecting radially from its convex surface, and shaft *m* rigidly fixed in its axis; also washers V' or concave-convex plates, having eyes to pass the sphere-shaft through, employed to relieve the friction of the sphere in the hanger.

Claim.—1. Trunnions or projections as equipments on a spherical gear, when retentively inserted and closely fitted to constitute the gear an independent traveler, and as definitely radially-poised cylindrical detents to transmit the energy of the driver to the driven gear transitively, substantially as and for the purpose herein set forth.

2. The spherically-dished female gear provided with any conformation of isotope between the straight or curved subdivisions of its concave surface, to effect the transit of the male-gear trunnion-crowns in the imaginary chord-lines, herein set forth, and for the purpose substantially as described.

3. The concavo-convex washers, in combination with the male-gear journals and the hanger-arms as friction-relievers, and blocks to gage the instep of the trunnions by the lateral adjustment of the female gear, as herein described.

4. The dunnion or sphere complements, when employed to keep the trunnions inserted in the spherical shell, all constructed and applied substantially as herein set forth.

5. The trunnions, when provided with chamfers, or their equivalents, as herein set forth.

6. In combination with spherical gears, the arch-formed stirrups, each provided with arms to hug the sphere appositely, employing the sphere-shaft as the hinge-pintle, about which the stirrup-frame swings, and provided with the bearing for the shaft of the sphere male, so arranged as to present said shaft radially toward the sphere-center, in the manner as and for the purpose herein set forth.

7. The dynamic governor or cut-off composed of the gravity-lever A, the spirally-grooved sleeve A^1 A^2, and the detent H, in combination with the stirrup M and the male and female gears, all constructed and arranged, to effect the conjunction and disjunction of the gears, in the manner herein set forth.

8. The spherical ball-formed spindles P P' J, constructed as and for the purpose herein set forth.

9. The combination of ball B, trunnions K, stirrups M, pinions *a* and *b d*, and cut-off A A^1 A^2 H, substantially as herein set forth.

10. The combination of two equipped spindles, P P' J, with each other, with the interposed dummy Z', and the pinions *i i'*, as and for the purpose herein set forth.

11. The trunnion shown in Fig. 9, tablet-crowned, and belt-formed cheek, as herein set forth.

12. The arrangement of the trunnions on a spherical gear in circles smaller than, parallel to, and offset from, the maximeter score, as and for the purpose herein set forth.

13. The stile or shaft projection S on the sphere mate, in combination with the groove Q, girdling the sphere, for the purpose set forth.

14. The truncated sphere Z', or spherical periphery, provided with trunnions, substantially as herein shown and described.

15. The combination of the shafts *n* and *m* with each other, when aligned by the perforated dummy Z', or its equivalent, in the interior of the male gear, and when connected exteriorly by means of the rigidly-attached spindles P P' J, and one or more female gears, *i i'*, all encompassed by the stirrups M, substantially as herein shown and set forth.

16. A couple of spherical gears (male and female) equipped with trunnions and isotops for trunnions, respectively, applied to each other transversely as an articulation on midshaft about the sphere by an encompassing hanger or hangers, substantially as herein set forth.

145,076.—Car-Starter.—VALENTINE WIRICK, Chicago, Ill. Application filed June 23, 1873.

Friction-wheels upon a movable bearing are brought in contact with friction-wheels rigidly attached to the car-axle. By means of intermediate gearing, the motion thus generated winds a spiral spring within its drum, and is retained by a pawl and ratchet. Upon starting the car it is released and communicates motion to the axle. Upon reversing the motion of the car, the pawl upon the main axle is raised by being thrown in contact with a bent pin, which is turned down for that purpose by a rocking lever, which is in turn operated by an arm sliding in a spiral groove within the drum.

Claim.—1. The combination of the arms K, friction-wheels J H, cog-wheels D *c* G, spring *d*, ratchet-wheel *b*, pawl *f*, ratchet-wheel *n*, and pawl *r*, all constructed and arranged substantially as and for the purposes specified.

2. The combination of the arm K, friction-wheels J H, cog-wheels D *c* G, ratchet-wheels *b n*, ratchets *f r*, rod *t*, lever N, spiral channel *e*, shaft *g*, arm *h*, and arms or levers *j k*, all constructed to operate substantially as and for the purposes specified.

145,077.—Reciprocating Winnower.—HENRY C. WIETZ and CHARLES GEBHARDT, Jr., Northfield, Minn. Application filed June 14, 1873.

The shaker-bar is connected both to the shoe and to the grain-board, and causes them to reciprocate in different directions.

Claim.—The shaker-bar D, having one arm connected directly with the lateral screens, and the other with the grain-board, said arm pivoted at its angle to the side of the mill, and operated by a yoke-bar, *e*, uniting the extremity of the lateral arm directly with an eccentric upon the fan-shaft.

145,078.—Reed-Organ.—GEORGE WOODS, Cambridgeport, Mass. Application filed October 17, 1873.

The cover of the case has a compensating hinge to allow for shrinkage and swell of the wood. The pedal-action case is made separable from the case of the instrument, and is provided with a fifth caster. The sounding-hooks have a nib to fit a dent in the supporting-rail, which is also made skeleton for greater lightness.

Claim.—1. An adjustable board, *y*, to which the cover *c* is hinged, in combination with the spring *h*, or its equivalent, as and for the purpose set forth.

2. In combination with the covers *c d*, guide *l*, and rest *m*, the adjustable board *y*, hinged to the cover *c*, and the spring *h* and hook *i*, or their equivalents, as herein shown, and for the purpose set forth.

3. The handle *s* for the stops, provided with an annular groove, *q*, and projecting washer *r*, as and for the purpose set forth.

4. An organ-case, *a*, in combination with a separate or independent pedal-base, *n*, secured to the case *a* by means of the dowels *p p*, or their equivalents, as herein set forth and described.

5. The caster *t*, of equal height with the casters *u u*, in combination with the less-projecting casters *v v*, for the purpose set forth and described.

6. A sounding-hook, *x*, for musical instruments, provided with a projecting lip, *y*, for the purpose of attaching the hook to a metallic rail, as herein set forth.

7. The hook *x*, rail *z*, clamp 1, and screw 2, one of each for each sounding-hook, when constructed and arranged as and for the purpose set forth.

8. The metallic rail *z*, made with a perforated flange, 5 6 6 6, wholly or in parts, in the manner and for the purpose set forth.

145,079.—Knitting-Machine.—LUKE WOODWARD, Nottingham, England, assignor to GEORGE FOX. Application filed November 13, 1872.

The middle or main bar carries the guide which delivers the yarn to form the leg, while doing which the front and rear bars are held up out of work. The front bar is then lowered, and it and the main bar have a short traverse to form each one side of the heel-piece. Just previous to this, the rear bar, carrying two guides, is lowered and traversed so as to lay in an extra or splicing thread just above, and also throughout the entire heel-piece. As this rear bar is not required to traverse so far as the main one while producing the leg, it is connected to the latter by a swinging latch, raised at the proper time by coming in contact with a cam-piece, and the two bars disconnected.

Claim.—1. The combination and arrangement of mechanism, substantially as herein described, and shown in the drawings annexed.

2. The employment, in machinery for the manufacture of stockings, of three thread-carrier bars, acting substantially in the manner herein described, two bars to form the leg and heel pieces, and a third bar to lay in the splicing-threads, whereby the leg-piece of a stocking, with a cleared and selvaged heel and spliced ankle and heel, is produced without removing the work from the needles on which the leg is formed.

3. The combination and arrangement of mechanism, substantially as herein described and shown, for giving motion from one thread-carrier bar to another thread-carrier bar, so as to give it a traverse shorter than its own traverse.

145,080.—Table-Knife.—WILLIAM HENRY ANDREW, Sheffield, England. Application filed January 18, 1873.

A bent piece of metal is passed over the end of the handle, and the tang of the blade inserted through a slot formed for that purpose. The same rivet holds the tang and the slotted bent piece.

Claim.—A slotted tongue-plate, D E F, and transverse perforated blade-tang C, secured by the same rivet, as and for the purpose set forth.

145,081.—Refrigerator.—RICHARD ARNIGER, Baltimore, Md. Application filed October 11, 1873.

Claim.—The inclined ice-chamber D and inclined water-discharge tank E, arranged, with respect to each other, diagonally, and in the upper part of refrigerator, as described, for the purpose set forth.

145,082.—Animal-Trap.—HUDSON H. C. ARNOLD, Nicholasville, Ky. Application filed October 25, 1873.

The caught victim sets the trap for the next one.

Claim.—1. The combination of the trip-board B, catch D, and platform-lever E with the box A and chute C, when constructed and arranged substantially as herein shown and described.

2. The combination of the catch-rod G, lever I, and two hanging gates, H J, with the trip-board B, box A, and chute C, substantially as herein shown and described.

145,083.—Riding Attachment for Plows.—ANDREW H. BALLAGH, Bowensburg, assignor to himself and MARTIN MCNITT, Mound Station, Ill. Application filed June 21, 1873.

A triangular frame, with caster-wheel at each angle, supports the operator's seat, which is mounted over the rear angle. The draft-rods also form a triangle with the forward beam, which moves at right angles to the line of draft.

Claim.—The triangular frame A, caster-wheel B, beam D, and draft-rod F, combined in a riding-plow, as and for the purpose described.

145,084.—Scroll-Saw.—HENRY L. BEACH, New York, N. Y., assignor to BEACH WHEEL HORSE-RAKE MANUFACTURING COMPANY, same place. Application filed April 3, 1873.

The saw is strained by a spring formed by coiling wire about a central shaft, and operating, through a system of levers, upon the saw.

Claim.—The combination, with the bearing-plate C, of the strap or belt D, segmental plate or curved lever E, connected to the lever H, springs K, ratchet-wheels L, and shaft I, substantially as and for the purposes set forth.

145,085.—Wrench.—W. CHAPLIN BEMIS, Springfield, Mass. Application filed April 21, 1873.

The spring and nut jaws are arranged on the same side of the wrench-bar, and any strain brought upon the wrench tends to close the outer ends of the jaws and retain the parallelism.

Claim.—The combination and arrangement of the nut D, sliding piece I provided with the serrated piece G and jaw C, threaded bar A having thereon the jaws B and H, with the spring *a* placed between the jaw C and bar A so as to keep the two jaws B and C always parallel when turning a nut, substantially as described.

145,086.—Steam and Vaper Generator.—RICHARD BERRETON, Easton, Pa., assignor to BENJAMIN DOUGLASS, Montrose, N. J. Application filed September 13, 1873.

The water is forced into a series of hollow connected imperforate expanders, in which are a series of jet-balls, all arranged at the sides and ends of the furnace, the object being to generate steam almost instantaneously. All are connected and surrounded by a water-jacket. A series of pipes are arranged to form a cone with perforations in a chamber of the supply-pipe.

Claim.—1. A series of hollow imperforate expanders connected together, and a series of jet-balls combined therewith, the same being, respectively, connected with the feed or supply pipe and the conducting-pipe leading to the engine, substantially as shown and described, to operate as specified.

2. In a steam-generator, a series of expanders or pipes, I J, for generation of steam, arranged within a furnace-chamber with relation to the grate and ease or jacket thereof, as shown and described, whereby, when fuel is supplied, it will be confined upon and around the pipes, to burn in contact therewith, as and for the purpose specified.

3. The combination, with hollow balls for the instantaneous expansion of fluid, in the manner described, of an air-cushion, L, independent of the pump-cushions, and interposed between the pump and generator.

4. The series of pipes arranged to form the cone *n*, having perforations *r s*, in combination with a chamber, *p*, of the supply-pipe, as shown and described.

5. The combination of half-ball expanders J with the sides of the furnace, substantially as specified.

6. The said half-ball expanders attached to the sides of the furnace, so as to project and allow the heat to act between them and the furnace-walls, substantially as specified.

7. The connection of the half-ball expanders by the tube *c'* hollow bolt *b'*, and bars *d'*, substantially as specified.

8. The arrangement of the branched feed-pipes O and Q and regulating-cock with the expanders, so as to feed each row of expanders and regulate the amount of the feed to the pressure required, substantially as specified.

9. The arrangement of the main feed-pipe K, coil M, connection N, jacket-chamber R, feed-pipes O and Q, and the expanders in the order described, to apply the feed in the said order.

145,087.—Saw-Set.—JEROME N. BURGE, South Adams, Mass. Application filed October 4, 1873.

Claim.—The rear slotted arms J J, having front projections L L, and held adjustably to the lower jaw A, as and for the purpose described.

145,088.—Plow.—RICHARD A. BROWN, Oakland, Miss. Application filed July, 26, 1873.

Claim.—The combined brace and adjusting-rods F and G and their screw-nuts, in combination with the plow D and pivoted standard E, the rod G being pivoted to the rear extension of the land-side D', and all arranged with relation to the beam A, as shown and described, for the purpose specified.

145,089.—Cooking-Stove.—RICHARD H. BROWN, Linneus, Mo. Application filed October 20, 1873.

In the bottom of the ash-pit, underneath the fire-pot, is a sifter. The sifted ashes fall through a close passage into an ash-box under the stove. This condensing-passage is divided into two branches to allow the reservoir in front to receive heat between them from the oven.

Claim.—1. In a stove, A, the ash-pit C, the passages G G', pan I, and reservoir K, combined, arranged, and operating substantially as described and shown.

2. In a stove, A, the ash-pit C, passages G G', sifter E, pan I, and reservoir K, combined, arranged, and operating substantially as described and shown.

145,090.—Track-Clearer.—FREDERICK BUSH, Fergus Falls, Minn. Application filed May 10, 1873.

Claim.—Two rotary wheels with straight radial shovels H, arranged in front of a locomotive to throw the snow from the center outward and from the track, substantially as set forth.

145,091.—Bale-Tie.—LANDON CARTER, Huntsville, Ala. Application filed October 4, 1873.

Claim.—The combination of the halved or shouldered wedge J with the clip A C and block E, secured to the end B of the band, as shown and described, whereby the end F is bent and secured, as specified.

145,092.—Adjustable Hat.—I. YGNACIO CARRANO, San Antonio, Tex. Application filed August 30, 1873.

The hat is rendered adjustable to various sizes by being provided with a sweat-band made in sections. Each section is attached to a U-shaped spring, the end of which is flush with the bottom of the band, while the other is bent at right angles to its body, and extends outward under the brim, and is attached thereto.

Claim.—The hat-band B, made in sections, and each section provided with a U-shaped spring, C, as and for the purpose described.

145,093.—Fly-Trap.—HERMAN L. CHAPMAN, Marcellus, Mich. Application filed August 23, 1873.

A bottomless trap is provided with side troughs, and has side glasses sliding out and in said troughs.

Claim.—A bottomless fly-trap, having the two side glasses C C sliding out and in the troughs B, as and for the purpose described.

145,094.—Carpet-Rag Looper.—JAMES F. COOPER, Frankton, Ind. Application filed September 13, 1873.

The knife is fixed rigidly in the bed-plate, and a two-pronged guard in front of it to protect the fingers of the operator. On the same bed-plate is placed a stand with a sloping or conical top, in which is inserted a vertical needle, which holds an end of one of the rag-strips, while the two lapped ends, after being slit by the knife, are slipped over it, thereby forming the loop.

Claim.—The combination of holding and looping needle device B C, double guard E, and intermediate knife D, arranged upon the same bed-piece A, as and for the purpose described.

145,095.—Heater for Steam-Boilers.—DAVID COUSELIN, Fall River, Mass. Application filed July 22, 1873.

Claim.—A heater consisting of the water tube or space E, having the enlarged chambers F and G, and concentrically surrounding and surrounded by the steam-passages C and H with their chambers D and I, these again surrounding and surrounded by the steam-passage B and the casing A, when the whole is constructed to operate substantially as herein described.

145,096.—Liquid-Meter.—THEODORE A. CURTIS, Springfield, Mass., and JONATHAN S. CURTIS, Hartford, Conn. Application filed September 25, 1873.

The valves are so placed on the ends of the oscillating cylinder that their faces are parallel with its axis, and at right angles to the axis of its support. They are adjusted to their seats by means of one set-screw acting upon the body of the cylinder. The case is cylindrical or curved in its contour.

Claim.—1. An oscillating cylinder, D, which operates as the measuring-vessel, and provided with valves G, having a port, *e'*, therein, (one at each end,) the faces of which valves are parallel with the axis of the cylinder, and at right angles to the axis of its support, operating in connection with the valve-seats *u*, provided with an orifice or port, *a*, all substantially as described.

2. The tilting cylinder D, supported on trunnions *c'*, and provided with valves G, (one at each end,) both the faces of which are adjusted to their proper bearing against the valve-seats *u* at the same time by a set-screw, *i*, substantially as described.

3. An oscillating cylinder, which serves as the measuring-vessel, operating within and in combination with a case or inclosing-vessel of a curved or cylindrical form in its cross section, substantially as described.

145,097.—Clasp.—JOSEPH H. EASTMAN, Boston, Mass. Application filed November 3, 1873.

Claim.—The jaws A B, ring C, double-headed slide E, and countersunk slot, the whole being constructed, combined, and used substantially in the manner and for the purposes set forth.

145,098.—Dental Drilling-Machine.—CHARLES E. EDWARDS, Philadelphia, Pa., assignor to SAMUEL S. WHITE, same place. Application filed June 3, 1873.

The telescopic slide of the horizontal arm of the power-conveyer is furnished with an elastic cord or spring, which automatically withdraws the drill from the tooth whenever the operator relaxes his hold upon it.

Claim.—In dental drilling-machines, the combination of the elastic cord I with the tubes A and B of the horizontal arm of the machine, so as to automatically withdraw the tool while it is rotating, substantially as hereinbefore described.

145,099.—Gauntlet-Glove.—FREDERICK FARRANT, Gloversville, N. Y. Application filed July 12, 1873.

The gauntlet of the glove has two or more bands or cuff-like pieces laid one upon another with their pinked edges together.

Claim.—The wristband of a gauntlet-glove, composed of two or more bands, A B C, said parts being constructed and arranged substantially as and for the purpose described.

145,100.—Shaft-Coupling.—JAMES GIBBINS, Springfield, Mass. Application filed September 19, 1873.

The tightening-bolts serve to hold the pins in place, which lock together the sleeve and shaft.

Claim.—An improved shaft-coupling, consisting of the block B, having an opening, *b*, therein its entire length, in combination with the bolts *f*, which serve to tighten the sleeve and lock the pins A, inserted in the shafting to which the coupling is attached, substantially as described.

145,101.—Printing-Press.—WILLIAM H. GOLDING, Chelsea, Mass. Application filed November 13, 1873.

A tubular arm carrying a spring-pressed tripper, adjustable by a pin, is attached at one end to the clamp-bar, and at the other to a helical spring secured to the frame of the press. The action of the tripper, striking a stud on the frame, causes the clamps and the gage to be borne to and from the platen, as desired.

Claim.—The combination of the spring N, the stationary stud P, the tubular arm M, and the tripper O thereof, provided with the stop-pin *l*, all being arranged and applied to the shaft H and the frame A in manner and to operate substantially as specified.

145,102.—Fountain-Pen.—HENRY N. HAMILTON, White Plains, N. Y. Application filed October 25, 1873.

The reservoir is closed by a hollow screw-cap having a stem extending through the barrel to its contracted end and terminating in a valve to regulate the flow of ink. A perforated screw-plug is fitted in the cap to admit air through it to the reservoir.

Claim.—In combination with the barrel or ink-reservoir A, the hollow screw-cap B carrying the stem C and valve D, and adapted for the reception of the perforated screw valve or plug E, when the various parts are constructed to operate in the manner herein set forth and shown.

145,103.—Machine for Facing Cylinders.—THOMAS M. EISEMANN and FRANK L. MCDONALD, Omaha, Neb. Application filed March 29, 1873.

Claim.—1. A machine for facing cylinders, and for similar purposes, having a supporting cone or shell with central shaft and adjustable arms, an exterior adjusting cone, and revolving frame, feed-screw, and cross-head, arranged to operate substantially as shown and described.

2. The revolving frame L, in combination with the cones C and F, as and for the purposes described.

145,104.—Gate.—ELIJAH HICKMAN, Red Bluff, Cal. Application filed October 13, 1873.

Claim.—The double gate, with its central revolving post B, in combination with its operating ropes H H, which unlatch and open the gate, substantially as and for the purpose described.

145,105.—Hog-Tongs.—HUGH W. HILL, Decatur, Ill., assignor of one-half his right to CHARLES P. HOUSUM, same place. Application filed November 10, 1873.

One jaw passes over the upper and the other beneath the inferior maxillary, the knob fitting between the rami of the latter to keep the instrument from slipping.

Claim.—1. The knob C in a pair of hog-tongs, substantially as described.

2. The knob C, in combination with the jaws B and A, substantially as and for the purpose set forth.

145,106.—Bench-Plane.—GEORGE W. HUBER and AARON E. FLICKINGER, Norwalk, Ohio. Application filed October 18, 1873.

The thickness of the shaving is regulated by a conical cam, C, which forces the iron forward in the throat.

Claim.—The improved adjustable plane, consisting of base-piece P, pivoted shoe B with rubber cushions *b*, conical eccentrics C C', perforated plane-iron D, and clamping cap-piece A, constructed substantially as and for the purpose described.

145,107.—Churn-Dash.—ANDREW J. HUDSON, Camden, Tenn. Application filed October 25, 1873.

A thick revolving dasher with a vertical central shaft, one wing, on its upper side, presenting a shell-like concavity and cutting-edge to the cream and a corresponding convexity beneath, over and under which the cream passes; the opposite wing being just the reverse of this.

Claim.—The dasher A, provided with the grooves or concaves a^1, the recesses a^2, the shoulders a^3 and a^4, and the notches a^5, constructed and arranged in connection with each other, substantially as herein shown and described, and for the purpose set forth.

145,108.—Horseshoe.—ROBERT K. JORDAN, Oakland, Cal. Application filed May 16, 1873.

The heels of an ordinary shoe are made longer than usual and bent outward. A flat metallic plate encircles the shoe and extends beyond the heel and toe. This plate is supported on the outwardly-bent extension at the heel and by a bar, bent upward, projecting from the toe of the shoe.

Claim.—1. The shoe A, with its extensions *e* and bar or plate *f*, in combination with the surrounding metallic rim-plate B, substantially as and for the purpose described.

2. The metallic rim-plate B, constructed as described, having its forward end bent upward, and united to the toe of the horse-shoe by an angular plate or bar *f*, substantially as and for the purpose above described.

145,109.—Toy Putty-Blower.—NATHAN JOSEPH, San Francisco, Cal. Application filed October 25, 1873.

Claim.—As a new article of manufacture, a tube for blowing putty, beans, &c., constructed of sheet metal bent into cylindrical form, overlapped at the edges, not united by solder or other permanent fastening, and with or without a mouth-piece, substantially as specified.

145,110.—Hardening the Surfaces of Iron.—ROBERT T. KING, Pana, Ill. Application filed October 18, 1873.

Lamp-black, sal-soda, muriate of soda, black oxide of manganese.

Claim.—The within-described compound, substantially as and for the purposes herein shown and described.

145,111.—Cleaning Sewers.—BALDWIN LATHAM, Westminster, England. Application filed May 8, 1873.

Sewage is treated with sesquisulphate or sulphate of alumina, in conjunction with lime or chalk, and the precipitate thus obtained is partially dried and allowed to stand until catalytic action takes place, producing humus, after which it is treated with sulphuric or similar acid to carbonize it.

Claim.—The process of purifying sewage by treating the same with sewage-precipitate previously dried and carbonized, substantially in the manner set forth.

145,112.—Grain-Conveyor.—CONSTANTIN LAZAREVITCH, Brooklyn, N. Y. Application filed October 18, 1873.

Grain is conveyed from a hopper through pipes to a revolving wheel, by means of which it is evenly distributed in the hold of a vessel.

Claim.—1. In combination with the horizontal rotary wheel, having close bottom and partly closed covering, of the hopper U and tube V V, to distribute the grain equally on each side of the wheel, substantially as shown and described.

2. The combination of the conical frame, arranged above the wheel E, with the conical shield W, substantially as and for the purpose set forth.

145,113.—Sleeping-Car.—G. HERRMANN LINDNER, Brooklyn, N. Y. Application filed June 28, 1873.

The lower berth is formed by the bottom and part of the back of each seat, the upper section of the latter being turned up and secured against the section-partition by a leg, to form a partial support for the upper berth. The upper couch is secured in its day position by sliding bolts at rear and front. The partitions and curtains which belong to this couch are pivoted thereto, so as to fold within when stowed.

Claim.—1. In sleeping-cars, the combination of the seat-frame F, having cushion C, pivoted to arms *a*, and having leg *d*, with the back cushions D and E, substantially as described.

2. The pivoted arm *a*, having leg-shaped extension *a'*, as and for the purpose set forth.

3. The car-frame A, having stop-pin *s* and pivoted bolt *s'* for locking top cushion E, so as to support the upper berth, as specified.

4. The berth G, having the front and rear spring-bolts *g* and partitions I, in combination with frame A, having grooves *g'* and pendent arms H, for raising and lowering the same, as described.

5. The frame A, having lug *i* to arrest pendent arm H in its downward motion for the intermediate position of berth G, as set forth.

6. The rods *l* and longitudinal connecting-rod *l'*, combined with an upper curtain, L, in the manner and for the purpose described.

145,114.—Truss-Frame for Bridges.—JACOB H. LINVILLE, Philadelphia, Pa. Application filed June 9, 1873.

A truss-frame on which the lower end surfaces of the posts or struts are flat and rest on corresponding surfaces on the upper edges of the chord-bars above the transverse connecting pins, to which the floor-beams and vertical diagonal suspension-rods are secured in the usual manner. To increase the bearing-surface of the pins which connect the suspension members to the top chord, and thereby transmit the resulting strains from the suspension-bars directly to the struts, chord Z or channel bars are secured between the plates of the chord over the ends of the struts, and extend a short distance on each side of the pins, which pass through suitable openings in the bars. To provide a firm bearing for the nuts of the horizontal diagonal bracing of the floor-beams angle-bars are secured to the beams.

Claim.—1. The combination, in truss-frames for bridges or other structures, of a series of struts having substantially flat lower end surfaces, a series of chord-bars having similarly-formed edges on their eyes, on which the struts are supported, and a series of connecting-pins passing through the eyes and uniting the chord-bars at their ends, substantially as set forth.

2. The combination, with the upper chords and their connecting-pins, of the channel or I beams Z, substantially as and for the purpose set forth.

3. The combination of the floor-beams, the inclined washers F^2, bolted or riveted thereto, and the diagonal tie-rods F^1, as and for the purpose set forth.

145,115.—Corn-Planter.—ABNER C. MARTIN and ROBERT FERGUSON, Lena, Ill. Application filed August 22, 1873.

The clutches connecting the traction-wheels with the seeding and marking devices are held in place by forked springs, which may be simultaneously retracted by levers upon a rock-shaft. The seed-disks upon each side are oscillated by crank-levers and transversely-vibrating bar, rack, pinion, oscillating shaft, double lever, and cam-wheel. The hill-markers are operated by rock-shaft, lever, and pins upon main cam-wheel. Cut-off in seed-disk has curved slot, recess, and rubber-ball adjustment.

Claim.—1. In combination with the movable clutch-sleeves *c c*, the spring-forks *d d* and the revolving lever E, having arms *e' e'*, as described, the lever being adapted by its revolution to draw in the springs and release the clutch-sleeves, as described.

2. In combination with the cogged bar H, operating the planting-machine, the shaft G, having pinion *g'* and double lever *g*, and the wheel F, having projections *f*, as described.

3. The combination of the wheel F, having pins *f'*, with the rock-shaft P, spring R, and indicating-rods, as described.

4. The combination of a spiral spring, R, as described, with a rock-shaft, P, and indicating-rods *g g*, as and for the purpose set forth.

5. The cut-off described, having the block *n*, pivot-shaft *n'*, and ball *n''*, arranged as described, and for the purpose set forth.

6. In combination with the cut-off, constructed as described, the stationary plates I K and the intermediate oscillating plate *m*, substantially as described.

145,116.—Extensible Brace for Supporting Trenches.—SAMUEL G. MCKEEHAN, Paterson, N. J., assignor to MCKEEHAN & FITZGERALD, same place. Application filed September 6, 1873.

A device for supporting the walls of trenches and similar excavations, consisting of a double right-and-left screw working in boxes, provided with nuts, and arranged so that the turning of the screws extends the brace firmly against the opposite walls of the trench.

Claim.—The adjustable brace for supporting walls of trenches, &c., composed of the wooden tubes C C, provided with internal nuts D, and the right-and-left screw, arranged as shown and described, to operate as specified.

145,117.—Boot or Bootee.—TOBIAS P. MITCHELL, Haverhill, Mass. Application filed October 28, 1873.

Claim.—1. A boot having a quarter-piece, the edge of which passes inside of and is stitched to the facing-piece *h*, except at the corner, where the slit *l* is made to form an overlapping side-piece, *m*, stitched to the vamp, substantially as shown and described.

2. In combination with the vamp and quarter-pieces, connected as described, the garing-pieces *e*, fastened to the tongue and facing, and secured by the stay-piece *m* and its stitches, substantially as shown and described.

145,118.—Lock for Fire-Arms.—DANIEL MOORE, Brooklyn, E. D., N. Y. Application filed September 27, 1872.

Claim.—A blocking-piece, *i*, between the cock *c* and notch of the hammer-tumbler, constructed and operating substantially as set forth.

145,119.—Machine for Building Earth-Works.—HARVEY MOSELY, Cameron, Tex. Application filed July 28, 1873.

The earth is carried up an inclined way onto a platform supported upon a frame mounted upon wheels. The platform is hinged at one side, and rests at the other upon strong springs, where it is confined by a catch. When loaded the catch is released, and the force of the released springs discharges the earth from the platform. The platform is returned to its position by means of a windlass.

Claim.—1. The combination of a swinging platform, C, springs E, windlass F, and a fastening and tripping device on an elevated platform, A, substantially as specified.

2. The combination of the ascending way M with a frame, platform, and springs, substantially as specified.

145,120.—Plow.—JOHN B. NORRIS, Richmond, Va. Application filed September 16, 1873.

The plow-standard has two branches which pass through the beam, and both are cylindrical. The forward one is provided with an outer cylinder, the interior of which is fitted with anti-friction balls, so that it will turn with ease, and thus avoid clogging.

Claim.—The combination of anti-friction balls with a roller, cylinder, or drum, *w w*, and neck or stem *J K I* of a plow, in the manner as shown in Figs. 3 and 5, for the purpose substantially as set forth and described.

145,121.—Machine for Threading Screw-Blanks.—EDWARD NUEMET and JOHN FANNING, Brooklyn, N. Y. Application filed October 29, 1873.

The carrying-disk I is intermittently rotated to carry around two blanks to the cutters, and the frame in which the disk is journaled is moved laterally to clasp the blanks against a bearing-block, to form a rest for them while being rotated by screw-drivers that are advanced and enter the nicks. The cutters X X are caused to traverse the blank and cut the thread by a cam acting on the shaft W, the depth and form of cut being regulated by an arm projecting from the shaft that bears against a former on the end of a transverse slide.

Claim.—1. The double-acting cam H, in combination with the disk I, cutters X X, and revolving screw-drivers *b b*, constructed and operating as and for the purpose set forth.

2. The combination of the sliding bar E, provided with the projections F G, inclines J J, and steady-pin K, with the cams H D, disk I, and the sliding frame X K, operating substantially as and for the purpose set forth.

3. The carrying-disk I, having a transverse movement to clasp the screw-blank while being threaded, and an intermittent rotary movement to present more blanks for the action of the cutters, substantially as and for the purpose set forth.

4. The disk I, sliding frame X K, and bar E, operated as described, in combination with the screw-drivers *b b* and cutters X X, as and for the purpose set forth.

5. The combination and arrangement of the sliding bar T, having the formers U U, with the levers V V, carrying set-screws X' X', shafts W W, traversing arms X'' X'', and cutters X X, substantially as and for the purpose set forth.

6. In combination with the disk or carrier I in a screw-machine, the oscillating race O, arranged and operated as set forth.

145,122.—Safety Attachment for Car-Trucks.—GEORGE C. OWEN, Portland, Me. Application filed August 30, 1873.

Claim.—The pivoted bracket-bearing B, having segmental slot *b*, combined with step *b'* of cross-piece C, substantially as set forth.

145,123.—Caloric-Engine.—NICOLAUS A. OTTO, Gasmotoren-Fabrik Deutz, at Deutz, Germany. Application filed July 9, 1873.

Hot air at atmospheric pressure is drawn into the cylinder during two-thirds of the down-stroke of the piston, when the supply is cut off and the air dilated during the remainder of the stroke. The cylinder is surrounded by a cooling medium to obstruct the heat from the air. The lower end of the cylinder being open, the pressure of the atmosphere drives the engine. The piston-rod is so connected to the shaft that the forward stroke of the piston is made in much shorter time than the return stroke.

Claim.—1. The method of utilizing heated gases in caloric-engines, by drawing them, at high temperature and at atmospheric pressure only, quickly into the cylinder, and cooling them therein, whereby the pressure on one side of the piston is reduced below that of the atmosphere on the other side, substantially in the manner and by the means set forth.

2. The mode of utilizing heated gases in a caloric-engine, by admitting them to the cylinder during only a portion of the forward stroke, and dilating them by the further motion of the piston, as distinguished from causing them to act successively against the piston, in the manner and by the means substantially as set forth.

3. In caloric-engines, the jacketed cylinder *a*, open to the atmosphere at one end, with slide *g* for cutting off the supply of heated gases, and valve *i* for discharging the cooled gases, in combination with the piston *b* connected to the crank-shaft *c* with fly-wheel *f*, in such manner that the piston performs its outward stroke quicker than its return stroke, substantially as and for the purposes herein set forth.

145,124.—Shoe-Last.—PARKER P. PAUL, Brooklyn, N. Y. Application filed March 1, 1873.

Holes are made in the surface of a metal-faced last coinciding with the holes in the plate, and provided with a screw-thread bushing. Detachable plugs of wood to receive the tacks are held in place by a hollow screw, which screws against a shoulder on the plugs.

Claim.—The combination of screw-threaded bush and hollow screw with detachable plugs, substantially as and for the purpose described.

145,125.—Paper-Bag Machine.—JAMES P. RAYMOND, Cincinnati, Ohio. Application filed May 23, 1873.

A bag-length tube projects through a slotted table, and is fed through the machine by two endless belts clamping its lower end. Its upper end rests against a gage, and is spread to admit the opener, which consists of hinged plates *c c*, which, descending, spread flat, and thus open and spread the tube-end flat upon the table, (Fig. 1a.) The triangular end folds thus formed are held flat by auxiliary plates *a a'*, hinged to the wings *c*, and plate K independently vibrated into position, which hold and guide them as the belts are brought together to grasp and feed the tube onward. It passes under a pressing-roll, R, which creases for side folds, and under a pasting-roll, S, which applies paste to the proper points from its peripherical projections. The side folds are turned down by twisted plates and spring-fingers, and pressed flat by roll *m*, which also creases the bottom centrally for the packing-fold, which is accomplished by plates *t t'* and a central tongue, *t''*, which fold the sides of the folded bottom into a plane parallel with the tube, which bag is fed out by rolls *u*.

Claim.—1. The machine as a whole, organized by the use of a divided table, to perform, by a series of successive operations, substantially in the manner described, the work of opening and folding down the end of a tube of paper, feeding the tube along the table, pressing the folds, pasting and folding the side flaps, and folding back the flaps for convenience in printing and packing.

2. The reciprocating bar C and hinged opening and folding wings *c c*, combined and operating substantially in the manner and for the purpose specified.

3. In combination with the wings *c c* and bar C, the folding-plates *a a'*, operating substantially in the manner and for the purpose specified.

4. The combination, with the wings *c c*, bar C, and folding-plates *a a'*, of the independent folding and guide plate K, substantially as specified.

5. In combination with the roller S *s*, the lifting-yoke T, as and for the purpose specified.

6. The combination of side folders or guides Y Y' and flexible fingers Z Z, operating substantially as and for the purpose described.

7. The pressing and centrally-creasing roller *m m'*, operating in the manner and for the purpose specified.

8. The combination of the folders *t t' t''*, operating substantially as and for the purpose specified.

9. The combination of folders *t t'*, central web *t''*, and pressure-rollers *u u'*, operating substantially in the manner and for the purpose specified.

10. In a machine for making satchel-bottom paper bags, the vertically-arranged feeding-belts L L', operating substantially as and for the purpose specified.

145,126.—Extensible Brace for Supporting Trenches.—WILLIAM REILLY, Newark, N. J. Application filed October 18, 1873.

An extensible brace for supporting the walls of trenches and similar excavations, consisting of a quadrangular frame in which are threaded two screws with bread heads, which engage and sustain the opposite walls of the excavation when the screws are extended by turning.

Claim.—A brace for staying sewer-banks, formed of the screw-rods A B, with heads C, and the nut or center-piece D E, said parts being arranged so that the screws work parallel to each other, as shown and described.

145,127.—Refrigerator.—ERASTUS S. ROOT, Providence, R. I. Application filed October 18, 1873.

The upper segmental ice-chambers B^2 are designed more especially to cool the box in which the refrigerating-chamber is placed.

Claim.—The improvement in refrigerators herein described, consisting of the metal cooler B, having the central food-chamber B^1, the surrounding ice-chambers B^2, and the short supplemental ice-chambers B^3, all constructed and arranged as set forth.

145,128.—Telegraph-Register.—WILLIAM H. SAWYER, New York, N. Y., assignor to THE AMERICAN DISTRICT TELEGRAPH COMPANY, same place. Application filed October 17, 1873.

Employs principle of screw-thread unison of printers to arrest clock-work of registers, preventing running down and waste of paper when not in use.

Claim.—1. The combination, with the pen-lever of a telegraphic registering or recording apparatus, of a shaft, Y, provided with a screw, S, and stop-piece X, a pivoted lever, L, carrying a pin, U, a supporting-arm, R, and a retracting-spring, O, substantially as and for the purposes herein specified.

2. The combination, with the screw S and pin U, of the pivoted lever L, the latter being made flexible for the whole or a portion of its length, substantially as and for the purposes herein specified.

3. The combination, with the arms R and L, of the adjustable stop V, substantially as and for the purposes herein specified.

145,129.—Rolling-Mill.—WILLIAM SELLERS, Philadelphia, Pa., and GEORGE H. SELLERS, Wilmington, Del. Application filed May 22, 1873.

The upper roll is raised for adjustment by counter-weights, and set down by means of hydraulic rams, the cylinders in which they work being situated in the cross-piece of each housing. The supply and discharge of the water are regulated by valves, arranged and combined with mechanism in such a manner that when a sufficient quantity has been admitted for adjusting the rams the supply shall be cut off, and the water retained within the cylinders to keep the roll in its adjusted position.

Claim.—1. The combination, substantially as before set forth, of the hydraulic cylinder, the ram thereof, and the self-closing mechanism for the inlet-valve of the said hydraulic cylinder.

2. The combination, substantially as before set forth, of the movable roll, the hydraulic cylinder, the ram thereof, and the closing mechanism for the inlet-valve of the said hydraulic cylinder.

3. The combination, substantially as before set forth, of the hydraulic cylinder, the ram thereof, the self-closing mechanism for the inlet-valve, and the adjusting mechanism for adjusting the said valve mechanism.

4. The combination, substantially as before set forth, of the movable roll, the hydraulic cylinder, the ram thereof, the self-closing mechanism for the inlet-valve, and the adjusting mechanism for adjusting the said valve mechanism.

5. The combination, substantially as before set forth, of the hydraulic cylinder, the ram thereof, and the indicating mechanism.

6. The combination, substantially as before set forth, of the movable roll, the hydraulic cylinder, the ram thereof, and the indicating mechanism.

7. The combination, substantially as before set forth, of the hydraulic cylinder, the ram thereof, the inlet-valve for said cylinder, and the admission-valve, which is closed while the inlet-valve is being opened.

8. The combination, substantially as before set forth, of the movable roll, the hydraulic cylinder, the ram thereof, the inlet-valve for said cylinder, and the admission-valve, which is closed while the inlet-valve is being opened.

9. The combination, substantially as before set forth, of the hydraulic cylinder, the ram thereof, the inlet-valve, the latch for holding the same open, and the slide for moving said latch.

10. The combination, substantially as before set forth, of the hydraulic cylinder, the ram thereof, the inlet-valve, and the check-valve for preventing the return of water from the hydraulic cylinder.

11. The combination, substantially as before set forth, of the admission-valve, the hand-lever, and the graded segment.

12. The combination, substantially as before set forth, of the inlet-valve, the mechanism for operating it, and the stop-latch for operating the exhaust-valve in connection with the inlet-valve.

145,130.—Paint Compound.—CARL AUGUST SITZLER, Kitzingen, Germany. Application filed November 1, 1873.

Claim.—The paint compound herein described, consisting mainly of pulverized iron, cement, oil varnish, spirits of turpentine, turpentine, soluble glass, mixed and combined with a ground solution of zinc-white, balsam of sulphur-turpentine, silver litharge, and manganese, substantially as and in the manner specified.

145,131.—Bolt for Doors and Gates.—JOSIAH SMITH, Southhold, N. Y., assignor to himself and L. F. TERRY, same place. Application filed November 1, 1873.

The inner plate of a bolt is cast with a transverse slot in one keeper, through which a loop or handle cast upon the bolt passes when the bolt is slipped in place. The outer plate is cast with an overlapping flange, a fixed loop near the forward end, and a transverse slot for the stem of another loop or handle, which passes through and is secured to the inside bolt.

Claim.—The inner plate A, cast with a closed keeper, a^1, a slotted keeper, a^2, and a slot, a^3; the bolt B, cast with a loop or handle, *b'*, and a hole; the outer plate C, cast with a flange, c^1, a loop, c^2, and a slot, c^3, and the handle D, constructed and arranged in connection with each other, substantially as herein shown and described.

145,132.—Attachment for Stove-Doors.—WILL O. SMITH, Boston, Mass. Application filed October 27, 1873.

The knob is attached to an oven-door by jaws, which embrace the ordinary "lift" or ear, and are fastened thereto by a screw.

Claim.—The knob E, provided with the concaved end K, combined with the jaws B C, body A, and set-screw D to form a stove-door attachment, as set forth and described.

145,133.—Pump-Box.—WILLIAM A. SPOONER, Springfield, Mass. Application filed August 16, 1873.

Upon the top of a pump-box a projection is arranged to serve as the valve-seat. To the rear of said projection a metallic stop is secured for the purpose of holding the valve in place, and also to limit the movement of the valve by serving as a stop, against which a finger upon the valve strikes, thereby preventing the injury done by the pounding incident to the ordinary construction.

Claim.—1. The pump-box B, having the projecting part C, which forms the seat of the valve, combined with the stop E, which secures the valve *g* in place, constructed and arranged substantially as herein described.

2. The combination of the valve *g*, finger *f*, and weighted trip H with the stop E, all arranged and operating as set forth.

145,134.—Method of Extinguishing Fire in Oil-Tanks, &c.—JOHN W. STANTON, Brooklyn, N. Y., assignor to J. H. COLTON, same place; said COLTON assignor of one-half his right to CHARLES M. MARTIN, New York. Application filed March 12, 1872.

Claim.—An apparatus, irrespective of form, in which the introduction of carbonic-acid gas beneath the surface of oil, petroleum, naphtha, or other inflammable liquid is employed to effect the more perfect diffusion of said gas on the surface of such liquid, for the purpose of extinguishing fire burning upon said surface, said apparatus consisting of any suitable device, either for generating carbonic acid gas beneath the surface of the oil within the oil-tank, or for introducing said gas beneath the surface of the liquid from any convenient generator placed outside of the oil-tank, all substantially as described.

145,135.—Carriage-Top Joint.—WILLIAM B. C. STERLING and JOHN W. POHLMAN, Batavia, Ohio. Application filed August 4, 1873.

Claim.—1. The combination of braces A, B, and C, forming a carriage-top joint or prop, substantially as and for the purposes described.

2. The combination, in a carriage-top joint, of the inclined brace A, provided with the forward extension *b*, having the rib *d*, and the front brace C, having the recess *d'*, as and for the purpose specified.

145,136.—Machine for Making Double-Pointed Screws for Knobs.—CHARLES H. THURSTON, Marlborough, N. H., assignor to himself and JAMES H. FOWLER, Boston, Mass. Application filed October 22, 1873.

The wire, revolving with the arbor C, is drawn through it and between the rolls *k k* by the stationary die D, through which it passes into the guide E, through a slot in which the cutting or milling wheel operates. The bearing G for the shaft of the milling-wheel is pivoted, and is raised at regular intervals by a cam on the shaft L to cause the wheel to cut nearly through the wire.

Claim.—1. The combination of the tubular arbor C, the griper M, the advancer D, the slotted guide E, the screw-cutting wheel F and its shaft-supporter G, and the operative cam K, all being arranged and provided with operative mechanism, substantially as described.

2. The combination constituting the griper M, such consisting of the V-grooved wheels *k k* and the levers *g g*, the cross-head *f*, the conic frustum A, and the wheel *i*, all being as set forth.

145,137.—Egg-Carrier.—FRANK M. WADE, San Francisco, Cal. Application filed October 4, 1873.

The compartments are strengthened at the corners by a duplication of the material, which is bent at a right angle from the strip that forms the sides.

Claim.—The system of egg-pockets herein described, consisting in connecting and fortifying the pockets at the points of connection by a return and duplication of the material from the corner of one pocket to the departure of the partition of another, as set forth.

145,138.—Caster-Bottle.—AUGUST WEBER, Newark, N. J. Application filed August 6, 1873.

In the bottom of the bottle is a cylinder, through which its contents are ejected by means of a piston and piston-rod connected by mechanism in the mouth of the bottle.

Claim.—The valve *u* for the nipple *r*, in combination with the piston *k* and rod *d*, and mechanism connecting the valve-stem to the piston-rod *d*, substantially as set forth, so as to withdraw the valve as the piston-rod is forced down, substantially as set forth.

145,139.—Fountain for Soda-Water, &c.—FRIEDRICK W. WESSENBOCK, New York, N. Y. Application filed September 20, 1873.

A nut screw-threaded both interiorly and exteriorly is fastened to the lining, and projects through the cover, to which it is fastened by an outside nut. The discharge-pipe passes through it. The outside case has a detachable bottom, so that the lining may be taken out for repair.

Claim.—1. The nuts I J, combined with the pipe F, lining D, and cover E, as and for the purpose described.

2. The body A and flanged bottom B *b*, combined with a base, L, provided with recesses *l l*, as and for the purpose described.

145,140.—Filling for Beds, Mattresses, &c.—JOSEPH C. WIGHTMAN, Newton, Mass. Application filed September 30, 1873.

As a filling for beds, &c., the material known as excelsior is impregnated with substances to render it uninflammable and antiseptic.

Claim.—1. As a new article of manufacture for filling beds, mattresses, &c., excelsior rendered uninflammable by impregnating it with substances to prevent its inflammability, substantially as set forth.

2. In bed-filling of uninflammable excelsior, the treatment by disinfectant or antiseptic substances, substantially as specified.

145,141.—Fire-Place Grate.—JONATHAN E. WOOD, Huntington, W. Va. Application filed March 19, 1873.

The grate is pivoted near its top, and may be swung back into the fire-place out of the way of the summer-front.

Claim.—The combination and arrangement of the pivoted basket B, spring-catch C, and damper D with the grate-front A, as shown and described, and for the purpose set forth.

145,142.—Hub-Boring Machine.—DAVID R. WRIGHT, South Amesbury, Mass., assignor to CYNTHIA A. WRIGHT, same place. Application filed October 11, 1873.

Claim.—The toggle-levers *e* having jaws *f*, the socket-threaded link *g* and the screw A, combined with a plate, *d*, having the leg *h'*, and attached to platform B *e b*, as and for the purpose described.

145,143.—Non-Freezing Battery.—EDWARD H. ARNCROFT, Boston, Mass. Application filed October 30, 1873.

A number of battery-cups are arranged upon shelves in a subterranean casing containing a lamp and having ventilating-pipes.

Claim.—The outdoor battery composed of cells C, inclosed in a subterranean close chamber, and provided with lamp D, pipe E for supplying fresh air, and vent F for escape of the battery-fumes and products of combustion.

145,144.—Manufacture of Glassware.—ANDREW H. BAGGS, Bridgeport, Ohio, assignor to LA BELLE GLASS COMPANY, same place. Application filed October 13, 1873.

Mold for fluted-stem ware has a scalloped joint concealing mold-mark.

Claim.—1. A mold for making fluted-stemmed glassware, having the junctions of the stem part of the mold with the body part of the mold formed in a scalloped or waving line, substantially as set forth, whereby the annular mold-mark is concealed.

2. A fluted-stemmed article of glass with a molded stem, and a scalloped annular joint at *b*, as a new article of manufacture.

145,145.—Salver.—ANDREW H. BAGGS, Bridgeport, Ohio, assignor to LA BELLE GLASS COMPANY, same place. Application filed October 13, 1873.

Molded in two parts, with male and female screws to secure them together, and an elastic packing between the shoulders.

Claim.—As a new article of manufacture, the salver herein described, made entirely of glass, and consisting of the top A, provided with the boss *a* and screw-stem *c*, and the pedestal B, having the female screw *d* and recess *b*, to receive an elastic washer, as set forth.

145,146.—Car-Axle Box.—JAMES E. BERRIE, Newburg, N. Y. Application filed June 23, 1873.

A supplementary oil-reservoir is affixed to the axle-box, and when the plugs of tallow or other material melt the oil flows from the supplementary reservoir into the journal-box.

Claim.—1. In a car-axle box the auxiliary reservoir B filled with fluid lubricant, and having a passage to the axle, closed with a plug fusible at a low temperature, substantially as and for the purpose described.

2. The auxiliary box B and axle-box A, cast together and having the holes *a b* in the division-plate, combined with brass bearing D having a duct, *d*, leading to periphery of journal, as and for the purpose described.

145,147.—Wheel-Plow.—JACOB BINGHAM and ORLANDO M. POND, Waterloo, Iowa. Application filed October 30, 1873.

A crank-screw, passing through a nut bedded in the axle, elevates or depresses its land end, while the other axle-arm slides up and down in a box secured to the axle, and is held at any height by a set-screw. The distance of one plow from the other is regulated by slotted guides secured to the rear side of the axle.

Claim.—In a plow-carriage, the axle A, having the adjustable screw lifting device *a b d* at one end, and the plate and box *a'* with set-screw *b'* at the other end, of the axle, in combination with the plow-beam D and staple *c*, sliding on axle-arm B', and the plow-beam D', adjustable by slotted guides on the axle, substantially in the manner and for the purpose herein set forth.

145,148.—Sewer Attachment to Plows.—JOB BROWN, Southampton, Ill. Application filed January 4, 1873.

As each furrow is turned the seed is sown upon the last furrow, the hopper and supporting-bar being fixed transversely upon the plow, the feeding-worm, worked by a belt from a toothed ground-wheel, carrying the seed to a convex plate which scatters it.

Claim.—The attachment to an ordinary plow, consisting of the supporting-bar D, hopper G, worm R, convex scattering-plate P, pivoted stirrup K, and wheel H having spurs, as described, to serve as band-wheels for the driving-belt, the several parts being arranged as specified.

145,149.—Manufacture of Gunpowder.—FREDERICK BURNEY, Faversham, Great Britain, assignor to THOMAS S. POPE and WILLIAM S. COLVIN. Application filed October 2, 1873.

Claim.—1. The process herein described of molding meal gunpowder or broken-down mill-cake into regular pebbles or grains of large size at one operation by pressure between plates having cellular surfaces, substantially as described.

2. Mold-plates with cellular surfaces, the cells being shaped and arranged substantially as hereinabefore described, and for the purpose specified.

145,150.—Furnace-Door.—JOHN M. CLARK, Louisville, Ky., assignor of one-half his right to THOMAS C. COLEMAN, same place. Application filed July 18, 1873.

The side and bottom edges of the front plate are cut away at the corners, and corner-angles, which are flanched over the front plate, substituted, and firmly secured by bolts and nuts.

Claim.—1. A furnace-door provided with false or removable corners, substantially as and for the purpose set forth.

2. The corner-pieces D, constructed as described, in combina-

tion with the door of a furnace, substantially as and for the purpose described.

145,151.—Production of Turpentine from Sawdust.—SETH L. COLE, Brooklyn, N. Y. Application filed July 5, 1873.

Consists in the utilization of sawdust or wood in a powdered state for producing spirits of turpentine by means of any suitable steam apparatus.

Claim.—Utilizing sawdust in the manner and for the specific purpose set forth.

145,152.—Burnisher for Photographs.—CHARLES B. COBANT, Lewiston, Me. Application filed October 16, 1873.

A sliding adjustable concave burnishing-tool is moved over an adjustable elastic bed.

Claim.—1. The adjustable sliding burnisher D^1, having the dovetailed tongue d^2, in combination with the standard D^2, having the screw d^3, substantially as described.

2. The standard D^2, having the dovetailed tongue d, in combination with the bar C, having the dovetailed channel D, and the burnisher D^1, as substantially as specified.

3. The bar C, guide-rib D, standards B B^1, adjusting-screws C^2, standard D^2, and sliding burnisher D^1, combined substantially as specified.

4. The cushions C^1, supporting the bar C, in combination with the screws C^2 and burnisher D^1, substantially as specified.

5. The adjustable block G, plate H^1, blocks H, and recessed base-plate A, combined substantially as specified.

6. The eccentric rollers z, cranks b, and connecting-link b^1, in combination with the adjustable block C, substantially as described.

145,153.—Hand-Cultivator.—SAMUEL A. CONRAD, Central's, Ill. Application filed November 6, 1873.

The hoes are convex, and designed to be on a line nearly parallel with the surface of the ground when in use.

Claim.—The within-described hand-cultivator, consisting of the triangular teeth or blades A, shank B, bar C, and intermediate teeth D, all substantially as and for the purpose herein set forth.

145,154.—Breech-Loading Fire-Arm.—LOUGHLIN CONNOY, New York, N. Y. Application filed April 9, 1873.

Claim.—1. The cocker-lever G, pivoted to the lower rear projection of the downward and backward swinging breech-block whereby, in addition to its having an independent movement to drive the firing-pin forward and to start the hammer, it is moved by the breech-block to continue the movement of the hammer to half-cock, as set forth.

2. The combination of the cocker-lever, the breech-block, and the lever-guard having the arm C, whereby the hammer is carried back by a duplex motion of the cocker-lever, and the breech is opened, as specified.

3. The combination of the cocker-lever G, pivoted to the breech-block, as described, the hammer H, the firing-pin E, and the lever-guard B, for automatically placing the hammer at half-cock when the breech is being opened, as specified.

4. The arrangement, substantially as herein shown and described, of the cocker-lever G, the breech-block C, the hammer H, the mainspring I, and the trigger K, whereby, when the breech-block is depressed to its fullest extent, and pressure removed from the guard-lever, the mainspring lifts the upper surface of the forward end of the breech-block, so as to retain the cartridge after insertion, before the breech-block is closed.

145,155.—Mucilage-Cup.—JOSEPH E. CROSBY, New York, N. Y. Application filed July 10, 1873.

The neck *p* of the cup has an annular groove, through notches in which are inserted corresponding projections on a wire ring, leaving a space between the neck and the ring, which is used to remove superfluous mucilage from the brush.

Claim.—The ring F, having the arms *b'*, in combination with the mucilage-pot having the grooved and notched flange C, substantially as described.

145,156.—Soldering-Tool.—LEWIS CUTTING, San Francisco, Cal. Application filed August 16, 1873.

The soldering ring or tool is formed in sections, and secured by a hoop, so that one or more sections may be replaced whenever necessary.

Claim.—The soldering-ring composed of the sections F, in combination with the block C and the holding-ring G, when constructed to operate substantially as herein described.

145,157.—Trap for Steam-Pipes.—MARSHALL T. DAVIDSON, Brooklyn, N. Y. Application filed October 4, 1873.

The valve D being first adjusted at a suitable distance from its seat B, air is forced out on the admission of steam. A continuance of the steam-pressure expands the inner tube, of which the valve D is a prolongation, and prevents the escape of steam.

Claim.—1. The combination of the external iron pipe A, the internal copper pipe E, the valve D, seat B, and openings *c*, *f*, and *g*, to permit the free circulation of steam both inside and outside the pipe E, as explained.

2. The combination of the pipe A, port *b'*, valve D, expansible hollow valve-rod or pipe E, and the head F, adjustable, for the purpose of setting the valve in proper normal position, substantially as explained.

145,158.—Windmill.—JOHN P. DAVIS, Galveston county, and ASA MORGAN, Cedar Bayou, Tex. Application filed October 7, 1873.

A vertical wind-wheel is placed within a shell or shield of semi-cylindrical form, said wheel being hung on the wind-wheel shaft, to turn easily thereon, and in so connecting the vane with said shield that a small wind-wheel mounted upon the vane will control the position of the shield, turning it over the wind-opening during heavy gusts or squalls of wind, and allowing it to enlarge the wind-opening during comparative lulls.

Claim.—1. The semi-cylindrical shield G, combined with the wind-wheel I on the weather-vane, and arranged to partly embrace the operating wind-wheel C, substantially as described.

2. The combination of the rope *n*, weighted rope *p*, and wind-wheel I, with the vane H, disk F, and shield G, to operate as specified.

3. The buckets *s* of a wind-wheel connected with the annular weight D, and combined with the notched spring-levers E, substantially in the manner herein shown and described.

145,159.—Paper-Pulp-Washing Machine.—SAMUEL DEACON and JAMES DEACON, Lawrence, Mass. Application filed August 1, 1873.

The dirty water flows from the revolving cylinder through a siphon passed through one of its journals. The inner opening of the siphon is controlled by a float-valve.

Claim.—The siphon B C D, its automatic valve E, float G, and water-seal L, in combination with a revolving gauze cylinder, A, of a paper-pulp-washing machine, substantially as and for the purpose set forth.

145,160.—Coil-Spring Garter and Belt.—JAMES M. ELLIS, Bridgeport, Conn., assignor to DOOLITTLE MANUFACTURING COMPANY, same place. Application filed November 15, 1873.

The end plate has prongs with hooked ends bent upon a needle running through the springs, or bent directly upon the coils of the springs.

Claim.—1. The method herein described of fastening the springs to the end plates by means of the hooked points *a a*, with or without the needle or wire, substantially as set forth.

2. As an article of manufacture, a garter or belt composed of a series of coiled springs, braided or plaited, substantially as and for the purpose set forth.

145,161.—Burnisher for Photographs.—WILLIAM G. ETTRIKIN, Philadelphia, Pa. Application filed November 11, 1873.

An oscillating movement of the plate carrying the burnishing-tool is effected by means of cam-grooves in the pressure feed-roll.

Claim.—1. A burnishing-machine provided with an oscillating burnishing-tool and a feed-pressure mechanism, substantially as described, by which a polished surface is given to the article burnished.

2. The combination of an oscillating burnishing-tool with a friction feed-roll, substantially as described.

3. The plate D, provided with a clamping device, in combination with the removable burnisher *z*, substantially as described.

4. The combination of the plate D, provided with the flange *d* and the gage-jet G, feed-roll B, and burnisher *z*, substantially as described.

5. The combination of the feed-roll B, oscillating burnisher *z*, and pinion with the adjusting apparatus, substantially as described.

145,162.—Ironing-Table.—ENOCH S. FAMOUS, Philadelphia, Pa. Application filed October 28, 1873.

In connection with the board and legs is a frame with a knee-joint with a tie-bar attached. Rods are also attached, which support an apron.

Claim.—1. The combination, with the board A, hinged to the rear legs $B' B'$ substantially in the manner described, the knee-jointed frame D D, the swinging or vibrating legs B B, and the tie-bar E, the said parts being arranged to operate substantially as and for the purposes herein before set forth and described.

2. The combination, with the side pieces C C and rear legs B' B', of the apron F with its rods $f' f'$, substantially as and for the purposes herein before set forth and described.

145,163.—Harness-Fastener.—JAMES G. FLEMING, Cochranton, Pa. Application filed July 26, 1873.

Claim.—The combination, with the curved ratchet-tongue A and socket B, of the thumb-pawl C, loops D D', and draw-strap E, substantially as specified.

145,164.—Bracelet.—AVERY FOBES, Attleborough, Mass. Application filed February 20, 1873.

Claim.—1. The combination, in a bracelet, of the front piece A, with a lining, B, formed with a depression, *b*, substantially as described.

2. A lining, B, depressed toward the front A, and soldered to the front at the edges *a a*, and at the central or depressed portion *b*, substantially as described.

145,165.—Axle for Vehicles.—HENRY FREDERICK, Butler, Pa. Application filed July 12, 1873.

Claim.—The recessed wrought spindle A, in combination with the cast sleeve D and steel plate C, as specified.

145,166.—Process of Utilizing Old Railroad-Rails.—GEORGE FRITZ, deceased, Johnstown, Pa.; JOHN FRITZ, JAMES MCMILLEN, and WILLIAM R. TUCKER, executors. Application filed July 17, 1873.

The flanges of the rails are cut off, as at A, previous to rolling into bars.

Claim.—The process herein described of utilizing old rails and rail ends of steel or homogeneous iron by removing the prominent edges of the flanges and subsequently rolling them.

145,167.—Steam Heater.—WILLARD M. FULLER, New York, N. Y. Application filed November 11, 1873.

The supply of water is so limited and proportioned to the steam-holding capacity of the radiating system that it is all vaporized with the exception of the water of condensation, which is sprayed upon the heated evaporating surface from the perforated return-pipe.

Claim.—The process of heating by steam, substantially as herein described, the steam being forced, through a pipe or series of pipes, through a building, and, when condensed, returning through a perforated return-pipe extending nearly across the generator near its top, forming a spray falling in the generator, and kept in constant circulation through the building without an additional supply of water, and without the use of valves, for the purpose specified.

145,168.—Ear-Muff.—SIGMOND GOSS, New York, N. Y. Application filed August 5, 1873.

The inner covering portion of the ear-muff is cut away at the lower front part to make a passage for sound.

Claim.—The ear-muff consisting of the exterior portion *b* and interior portion *a*, constructed and arranged substantially in the manner described, and for the purpose set forth.

145,169.—Brick-Machine.—DAVID GOLDTHORP and THOMAS HIELD, Hartford, Conn., assignees of one-half their right to JOHN B. CLAPP, same place. Application filed July 19, 1873.

A receding back plate, which permits the clay not required in filling the molds to pass until the stroke is finished. An adjustable piston and mold-carriage gear.

Claim.—1. In the piston-chamber of a brick-machine, the receding back plate I^2 with the advancing guide-stripe *i*, constructed and arranged substantially as and for the purpose set forth.

2. In a brick-machine, the adjustable piston-gear, consisting of the combination of the piston L, the shank K with the pins k^1 k^2 and the holes k^3, in connection with the lever M, the connecting-rod N, and the crank G', constructed and arranged as and for the purpose set forth.

3. In a brick-machine, the combination, with the mold-carriage and with the operating-levers S, of the rods R, and the adjustable swivels R' having the check-nuts *r*, all constructed and arranged substantially as specified.

4. In a carriage motion of a brick-machine, the combination of the lever U having the fixed fulcrum *u*, the levers U^1 U^2 having fulcrums u^1 u^2 and serrated surfaces u^3, the adjusting-weight W, and the adjustable connecting-rod T, all constructed and arranged substantially as specified.

145,170.—Middlings-Purifier.—ABSALOM R. GUILDER, Minneapolis, Minn. Application filed May 31, 1873.

Construction and arrangement of beating devices, collecting-chambers, air-passages, and partitions, draft-separator, and perforated air-pipes, with reciprocating screens and exhaust-fan.

Claim.—1. In a middlings-separator, the mallet F, on the elastic arm *f*, secured to the cross-bar G, and the shaft H, with arm A, constructed and arranged directly under the inclined oscillating screen C, and operating in the manner as shown and described.

2. In a middlings-separator, the deposit-chambers M M', with the covers *m*, hinged valved doors *m'*, and the vertical partition *o*, substantially as specified.

3. In a middlings-separator, the oscillating screen C, in combination with the oscillating blast-pipes P, substantially as specified.

4. In a middlings-separator, the combination of the screen C, the inclined plate I, the vertical partition T, and the draft-separator *v*, substantially as specified.

5. The combination of the hopper J, the chambers M M', the covers *m*, the fan L, the oscillating screen C, and mallet F, the inclined partition I, the screen C, and the oscillating perforated pipes P, the fan S, the partitions *o* T V, and the adjustable vents N N' I^1 I^2, substantially as specified.

6. In a middlings-separator, the oscillating pipes P, with perforations p^2, and regulating slide-valves *r*, arranged transversely underneath a reciprocating screen.

7. In a middlings-purifier, the stationary pressure-fan S, stationary air-chest R, and the oscillating perforated pipes P, in combination with a reciprocating screen, substantially as and for the purpose specified.

145,171.—Permutation-Lock.—HENRY GROSS, Cincinnati, Ohio, assignor to HALL'S SAFE AND LOCK COMPANY, same place.—Case D. Application filed August 11, 1873.

The bolt and dog are constructed in a single rigid piece, and so arranged that the drive-wheel throws the bolt out and in, and causes its rear end to engage with a stationary shoulder for the purpose of locking the same.

Claim.—1. The bolt B, with its dog D formed in a single rigid piece, in combination with one or more tumblers, F, a locking-shoulder, and the notched drive-wheel G, all constructed and arranged to operate substantially as shown and described, whereby the bolt is thrown, made to engage with its locking-shoulder, and all the operations performed without the aid of a key, pivoted dog, or other devices, as herein set forth.

2. The sleeve I, with the tumblers F mounted thereon, and held in place by the sliding key-plate K, substantially as set forth.

145,172.—Stove-Grate.—WILLIAM HAGERTY, Philadelphia, Pa. Application filed May 31, 1873.

The sectional grate and its operating-gearing are mounted on the rotating ring.

Claim.—1. The sectional grate E and connected gearing F mounted on the rotating ring B, substantially as and for the purpose set forth.

2. The combination, with the grate E and gearing F, and the rotating ring B supporting said grate and gearing, of the lever G jointed to the grate, and projecting through the base A of the stove, substantially as and for the purpose set forth.

3. The combination, with the fire-pot J, of the grating K, adapted to rotate independently of the grate proper, and operated by the rod M, the parts J K having cut-away portions *a b*, respectively, as herein set forth, and for the purpose described.

4. The combination, with the fire-pot J and rotating grate K, of the windows or openings L, encircling the parts J K in relation to the cut-away portions *a b* of the parts J K, substantially as and for the purpose described.

145,173.—Sash-Balance.—CHARLES HARBAUGH, Eaton, Ohio. Application filed November 8, 1873.

Claim.—The strips G G, provided with holes *a a*, in combination with cords *a a*, keys *b b*, and sash B C, the parts being constructed and arranged either to admit of any desired adjustment of the sash, or to lock the same securely, when required, by means of keys *b b* and cord *a*, substantially as herein set forth.

145,174.—Drawing-Board Trestle.—JOHN H. HARDEN, Philadelphia, Pa. Application filed May 31, 1873.

A special construction of stands, which support the drawing-board independently of each other. Provision is made for adjustability both vertical and to any inclination likely to be useful.

Claim.—1. A drawing-board support, consisting of two bars, A A, adjustable horizontally on central pins *q*, and vertically as independent trestles, as set forth.

2. A stand, B, having bars *a a'*, and a plate, *a*, adjustable between the bars, in combination with bars *i i*, hinged to the said plate, and having segments *m m* adapted to bolts *l l* in the bars *a a'* of the stand, all substantially as described.

3. The structure composed of the bars *a a'*, legs *b b'* and *d d'*, cross-bars *e e'*, and inclined braces *f f'*, all fitted and secured together in the manner described.

145,175.—Boiler for Vaporizing Volatile Fluids.—JOHN F. HASKINS, Fitchburg, Mass. Application filed November 12, 1873.

A vessel containing bisulphide of carbon is provided with drop-tubes, while the vessel containing water is also provided with tubes concentrically arranged about the drop-tubes, in order that a thin stratum of hydrocarbon liquid may be exposed to the heat of the boiling water.

Claim.—1. In a vapor-generator, two sets of tubes, one placed within the other, so as to break up both the water and volatile fluid into thin layers or strata, substantially as specified.

2. A boiler for vaporizing volatile liquids, consisting of the shell *a*, water tubes and space *c l*, fluid tubes and space *i m*, arranged and combined for operation substantially as shown and described.

145,176.—Lamp.—ROZERT HITCHCOCK, Watertown, N. Y. Application filed November 11, 1873.

In a forced-blast lamp the movement is inclosed on the sides and bottom by the oil-receptacle, and on the top is separated, by a close partition, from the fan. Air is supplied to the fan through a vertical passage in the oil-receptacle and through a horizontal passage traversing the lamp above the oil-receptacle. The wick-tube and its jacket is detachably placed entirely above the oil-receptacle. A drip-cup strains the drip, directs it from the fan, and restores it to the oil-tank. The lamp has trunnions. There results a force-blast lamp, made available for a railway-car lamp by protecting its movement from dust or cinders, by facilitating the trimming of its wick, by providing a means of support.

Claim.—1. In a forced-blast lamp, the combination, with the oil-reservoir, of the movement contained in a chamber separate and distinct from, but surrounded on all sides by, said reservoir, substantially as shown and described.

2. The combination, in a forced-blast lamp, of the movement, the fan or air-impelling device, separated and partitioned off from, but driven by, said movement, and air-passages through which the air-supply for the fan is taken in outside of, and without passing through or in contact with, the movement, substantially as and for the purpose set forth.

3. The wick-tube and its surrounding jacket, arranged entirely outside of, and removable, bodily and together, from the oil-reservoir or main body of the lamp, and provided with air-passages for conducting the impelled air from the fan to the flame, substantially as shown and set forth.

4. The combination of the air-impelling apparatus, the surrounding oil-reservoir, and the wick-tube and jacket surmounting said reservoir, and formed with passages through which the impelled air-current will be directed upon the flame, substantially as set forth.

5. The combination of the air-impelling mechanism, the oil-reservoir, and the wick-tube surmounting the same, with the pump mechanism and supply-pipe for feeding the wick with oil, and the overflow-trough and return-pipe for conducting back to the reservoir the surplus of oil, substantially as shown and described.

6. In combination with the elevated wick-tube and return-pipe, the combined ash-shield and strainer, intermediate between the open bottom of the wick-tube and the air-impelling fan, and constructed, as described, with a cup or dish shaped receptacle and a gauze diaphragm to strain the return oil and catch the refuse from the wick-tube, and with an annular projecting flange to deflect from the opening above the fan the matter that might otherwise drop from the said shield and strainer onto the fan.

7. The wick-raising sleeve, slotted as described, and provided with spring-catches located in said slots, and normally projecting inward through the slots beyond the inner surface of the sleeve, as and for the purposes shown and set forth.

145,177.—Rotary Plow.—ANDREAS B. HOFFMEYER and JAMES SCHMIDT, Copenhagen, Denmark. Application filed November 20, 1873.

The cutters and spades revolve in opposite directions by means of a crossed band. The loosened earth is taken up by the spades and carried over the cylinder, being prevented from falling at the side by the shield.

Claim.—The combination of the revolving cutters E, revolving shares A, and stationary shield or deflector D, all arranged and operating substantially as and for the purpose specified.

145,178.—Safety-Pocket.—HARVEY L. HOPKINS, Morrisville, N. Y., assignor of one-half his right to ALEXANDER M. HOLMES, same place. Application filed June 5, 1873.

Claim.—The herein-described safety-pocket, provided with a self-closing flexible flap, *a*, substantially as and for the purpose specified.

145,179.—Blocking Stereotype-Plates in Casting.—MARSHALL J. HUGHES, New York, N. Y. Application filed September 16, 1873.

Claim.—1. The combination, with the block or blocks D, of the stereotype-plate C, and the bottom plate connected therewith, by continuation of the metal on the sides of the block or blocks, as shown and described, whereby said parts form one article or device, as shown and described.

2. In combination with the blocks D, the protecting-plate or lining B, the same being applied, as shown and described, to form a more elastic bed for the plate, and render it more durable, as specified.

145,180.—Fire-Proof Column.—THEODORE HYATT, New York, N. Y. Application filed August 21, 1873.

A wooden column or beam enveloped in a fire-proof coating, consisting of asbestus mixed with earthy or plastic material which is strengthened by a cylinder of wire-netting embedded therein, and the whole covered with an ornamental casing or jacket of thin sheet metal.

Claim.—1. A wooden column or beam protected from the action of heat by means of a coating or envelope of asbestus combined with plastic or earthy material, substantially as is specified.

2. A wooden column or beam enveloped with a coating of asbestus, combined with earthy or plastic material, when the latter is strengthened and secured in place by means of a cylinder of wire-netting, substantially as and for the purpose shown.

3. A wooden column or beam coated exteriorly with asbestus combined with earthy or plastic material, and the whole covered with an ornamental casing or jacket, substantially as and for the purpose set forth.

145,181.—Fire-Proof Floor and Roof.—THEODORE HYATT, New York, N. Y.—Case A. Application filed October 8, 1873.

Claim.—A floor or roof composed of a corrugated sheet-metal diaphragm, covered with asbestus, combined with earthy material, substantially as and for the purpose specified.

145,182.—Fire-Proof Illuminating-Tile.—THEODORE HYATT, New York, N. Y.—Case B. Application filed October 8, 1873.

A fire-proof illuminating roofing-plate composed of a perforated lens-bearing sheet-metal plate, coated beneath with a layer of asbestus combined with some plastic and adhesive earthy material. The metal plate is furnished beneath with projecting-headed studs, to assist in retaining the earthy coating in place.

Claim.—An illuminating roofing-tile constructed of or from sheet metal and coated beneath with asbestus, made plastic and adhesive by the admixture of earthy or other suitable material, substantially as and for the purpose specified.

145,183.—Illuminating-Door.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place. Case 27. Application filed October 22, 1873.

An illuminating-door, composed of a tubular metallic frame and a perforated metallic panel set with lenses for the transmission of light.

Claim.—An illuminating-door composed of a tubular frame and a sheet-metal center or panel, substantially as and for the purpose specified.

145,184.—Metallic Hatchway-Door.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 29. Application filed October 22, 1873.

The iron frame upon which the heavy illuminating door closes is furnished with elastic buffers to relieve the shock of collision.

Claim.—In combination with hinged illuminating-doors for inclosing an elevator-opening, elastic buffers placed between the impinging surfaces of the same and of their frame, substantially as and for the purpose specified.

145,185.—Flexible Sheet-Metal Illuminating-Plate.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 21. Application filed October 22, 1873.

A roofing or skylight composed of flexible sheet-metal plates, perforated and provided with lenses.

Claim.—A roofing composed of flexible sheet-metal plates, and provided with glazed light-openings, substantially as and for the purpose specified.

145,186.—Ventilating Illuminating Roofing-Plate.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 31. Application filed November 11, 1873.

A skylight formed of perforated metallic plates, overlaid with glass panes, which slide in grooves, thus affording ventilation when desired.

Claim.—An illuminating ventilating-roof composed of perforated sheets of metal overlaid with glass, substantially as and for the purpose specified.

145,187.—Illuminating Vault-Cover.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 5. Application filed October 22, 1873.

Claim.—An illuminating-lens having tapering sides, provided with a screw-thread, and secured in position by means of a nut applied to or upon its lower threaded end, substantially as and for the purpose specified.

145,188.—Illuminating Vault-Cover.—THADDEUS HYATT New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 3. Application filed October 22, 1873.

Claim.—1. A button-head glass lens provided with a threaded shank, and combined with a grating by means of a nut, substantially as and for the purpose specified.

2. A nut having its threaded central portion extended beyond its bearing-face, substantially and for the purpose shown.

145,189.—Illuminating Vault-Cover.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 4. Application filed October 22, 1873.

The lens is made of conical form and screw-threaded upon its lower end. It is drawn forcibly into place by a nut, B, a rubber gasket being interposed between the glass and the plate to secure a tight and elastic joint.

Claim.—In combination with the illuminating-grating C, provided with light-openings, the lens A, provided with an enlarged head, *a*, and threaded shank *a'*, the nut B, engaging with said threaded shank, and the elastic gasket D, interposed between said head *a* and the sides of the light-opening, substantially as and for the purpose specified.

145,190.—Illuminating Vault-Cover.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 18. Application filed October 22, 1873.

The metallic shell, which carries the lens, is detached from the perforated plate, which forms the vault-cover, and rests upon it. The lenses can, by this means, all be removed together when desirable for ventilating purposes, without disturbing the perforated plate.

Claim.—An illuminating vault-cover, pavement-plate, &c., provided with a detachable lens-holder, substantially as and for the purpose specified.

145,191.—Illuminating Vault-Cover.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 10. Application filed October 22, 1873.

The metallic vault-cover is traversed by deep grooves at intervals, furnishing lines of breakage, so that the cover can be readily adapted to the size of the opening to be covered by breaking, without the necessity of expensive fitting.

Claim.—A metal grating for areas, stoops, sidewalks, &c., the frame of which is provided with grooves, along and within which said metal may be divided by breaking, substantially as and for the purpose specified.

145,192.—Illuminating Vault-Cover.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 6. Application filed October 22, 1873.

A metallic conical ring, provided at its upper edge with a flange, and at its lower aperture with a screw-thread, is soldered within the opening. A rubber gasket is then inserted, and the conical illuminating-lens is screwed to place, its lower portion being screw-threaded to fit the threaded portion of the ring.

Claim.—An illuminating-lens made tapering vertically, provided upon its periphery with a screw-thread, and combined with an inclosing metal ring, in the manner and for the purpose substantially as specified.

145,193.—Illuminating Vault-Cover.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 16. Application filed October 22, 1873.

Claim.—1. A vault-cover, pavement-plate, &c., provided with a detachable bearing or wearing surface, substantially as and for the purpose specified.

2. A vault-cover, pavement-plate, &c., provided with a detachable bearing-surface, and having interposed between the same and said cover or plate, rubber or other elastic material, substantially as and for the purpose shown.

145,194.—Illuminating Vault-Cover.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 19. Application filed October 22, 1873.

The upper surface of the metallic plate is covered by a shell or bearing-surface, which is held in place by flanges cast upon the illuminating-lenses, the latter being threaded below, and capable of being drawn down by nuts, so as to compress the surface-plate tightly by means of the flanges.

Claim.—A pavement-plate covered upon its upper side by a sheet-metal shell, which is held in place by means of the enlarged upper ends of its illuminating-lenses and nuts placed upon the lower threaded ends of the same, substantially as and for the purpose specified.

145,195.—Illuminating Vault-Cover.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 20. Application filed October 22, 1873.

Claim.—An illuminating vault-cover, pavement-plate, &c., in which the lenses are secured by means of molten lead or solder poured into and caused to fill the spaces between said lens and plate, substantially as and for the purpose specified.

145,196.—Illuminating Vault-Cover.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 24. Application filed October 22, 1873.

Claim.—A vault-cover, pavement-tile, &c., inclosed by means of a rubber shield, (with or without bearing-points,) which forms a packing for its illuminating-lenses, and between said tile and its surrounding frame, substantially as and for the purpose specified.

145,197.—Illuminating Vault-Cover.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 2. Application filed October 22, 1873.

Claim.—A glass lens having an enlarged or button-shaped head and a smaller shank or stem, substantially as and for the purpose specified.

145,198.—Illuminating Vault-Cover.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 1. Application filed October 22, 1873.

Claim.—In an illuminating vault or area cover, pavement-plate, &c., a detachable illuminating-lens, secured in place by means of an elastic gasket, substantially as and for the purpose specified.

145,199.—Illuminating Vault-Cover.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 9. Application filed October 22, 1873.

Claim.—An illuminating vault-cover, floor-light, &c., provided upon its upper bearing-surface with strips or buttons of rubber, substantially as and for the purpose specified.

145,200.—Illuminating Vault-Cover.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case. 7. Application filed October 22, 1873.

Claim.—An illuminating-lens having molded upon its periphery a metal frame, which is provided with a projecting head or flange, and with a threaded shank, substantially as and for the purpose specified.

145,201.—Illuminating Vault-Cover.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 26. Application filed October 22, 1873.

Claim.—In combination with an illuminating-plate, a shield of thin metal, or other suitable material, inclosing the lower side of said plate, and having its light-openings flanged upward, so as to catch the drip from the illuminating-lenses, substantially as and for the purpose specified.

145,202.—Illuminating Vault-Cover.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 8. Application filed October 22, 1873.

The illuminating-lens is set within an inclosing metallic frame capable of being soldered in its place in the vault-cover opening. This metallic frame enables very thick lenses to be used with thin supporting-plates.

Claim.—An illuminating-lens set within an inclosing metal frame, which is capable of being soldered to and within a supporting-plate, substantially as and for the purpose specified.

145,203.—Non-Condensing Illuminating Vault-Cover.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 15. Application filed October 22, 1873.

Claim.—An illuminating pavement-plate protected upon its lower side by means of a covering of wood, which latter is provided with light-openings which correspond in vertical position to the openings in said plate, and are each inclosed by one or more lenses, substantially as and for the purpose specified.

145,204.—Non-Condensing Illuminating Vault-Cover.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 13. Application filed October 22, 1873.

Claim.—A tile composed of a sheet-metal casing inclosing a wooden center, substantially as and for the purpose specified.

145,205.—Non-Condensing Illuminating Vault-Cover.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 12. Application filed October 22, 1873.

Claim.—An illuminating pavement plate or tile composed of a double shell of sheet-metal, having its interior filled with plastic material, substantially as and for the purpose specified.

145,206.—Non-Condensing Illuminating Vault-Cover.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 11. Application filed October 22, 1873.

The metallic perforated plate is protected upon its lower surface by a non-conducting casing of wood to prevent the condensation of moisture, and each illuminating-opening is surrounded at its lower edge by a ring of felt to absorb the small amount of moisture which condenses upon the lens.

Claim.—A metal plate provided with illuminating-openings, covered upon its lower side with a casing of wood or other suitable non-conductor of heat or cold, and having the lower edges of its said illuminating-openings covered with rings of felt or other like absorbent material, substantially as and for the purpose specified.

145,207.—Elevating Vault-Cover.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 28. Application filed October 22, 1873.

One of the panels of an illuminating vault-cover is arranged to rise and fall in ways, so as to serve the secondary function of an elevator-platform when desired. It is actuated by a windlass and chains.

Claim.—An elevator in which the platform serves the purpose of a support for articles being moved, and, when raised, constitutes a part of an illuminating sidewalk, substantially as and for the purpose specified.

145,208.—Flexible Illuminating Vault-Plate.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 23. Application filed October 22, 1873.

Claim.—An elastic plate provided with glazed illuminating-openings, and capable of being removed by rolling from a perforated supporting frame or grating, substantially as and for the purpose specified.

145,209.—Illuminating Ventilating-Stop.—THADDEUS HYATT, New York, N. Y., assignor to ELIZABETH A. L. HYATT, same place.—Case 30. Application filed October 22, 1873.

The steps of a stoop are formed of illuminating-plates, and the rear edge of each step is extended beneath the front edge of the next higher step, so as to form a ventilating-chamber, which is inclosed front and rear by glazed risers and movable glazed frames.

Claim.—1. In an illuminating-stoop, a ventilating-chamber formed by extending the rear edge of one plate beneath and in rear of the plate which forms the next highest step, substantially as and for the purpose specified.

2. In an illuminating-stoop, a ventilating-chamber formed between the rear edge of one plate and the overlapping front edge of a higher plate, and partly or wholly inclosed at its rear side by means of a glazed wall or partition, substantially as and for the purpose shown.

3. The overlapping illuminating-plates A and A', open risers B, and glazed frame E, when constructed and combined in the manner and for the purpose substantially as set forth.

145,210.—Propulsion of Vessels by Direct Action of Steam.—GEORGE W. JONES, Philadelphia, Pa. Application filed November 4, 1873.

Steam, admitted to a chamber extending below the surface and opening into the water, acts as a piston to force the water therefrom, and is then condensed, allowing the water to return, when steam is again admitted; and the operation repeated causes the movement of the boat.

Claim.—1. As the improvement in the propulsion of vessels herein before described, in combination with a navigable vessel, the cylinder or chamber G, having a single orifice, through which the water is alternately received and discharged at the stern, a valve mechanism, substantially as herein described, for controlling admission of steam, and a steam-generator, all combined and operating as specified, whereby the steam, acting upon the water within the cylinder as a piston, forces the same out, and then, condensing, causes the entrance of a like quantity of water, and so on alternately, as set forth.

2. The combination of the cylinder G, having orifice O, the small cylinder K, float J, valve-chest D, valve F, and tube E, with a steam-generator and a vessel, as shown and described.

145,211.—Fire-Proof Floor and Wall.—JAMES JOHN, Chicago, Ill. Application filed October 29, 1873.

The wooden joists which support the floor are rendered fire-proof by a coating of plaster or cement, the spaces between the joists being then filled with hollow blocks or shells of plaster-of-paris, or analogous material. The said shells have partitions to prevent circulation of air, and are laid so as to break joints. They are coated with cement like the joists, after being placed in position.

Claim.—1. In combination with the joists A A, the hollow shells or boxes D, to occupy the space between said joists, as set forth, to prevent the passage of air, as described.

2. In combination the joists A, furring-strips B, strips E, concrete layers C *c*, and the hollow boxes or shell D, as and for the purpose set forth.

3. The shell or box D, constructed open on one side, and with a medial partition, *d*, so that said shells may be laid "breaking joints," in the manner and to the effect described.

145,212.—Grate.—SOLOMON KEPNER, Pottstown, Pa. Application filed October 25, 1873.

The bars of the movable section of the bottom grate alternate in position with the bars of the fixed part of the grate. The movable section of the bottom grate is hinged at its rear, and its front can be raised to clean out ashes and clinkers.

Claim.—1. The movable or tilting bottom-piece C, combined with the rear bar D having an offset or groove, *d*, and with the bars B' having notches *b'*, in the manner and for the purposes set forth.

2. The combination of the bars B and B' with the tilting grate C having the projection *c'*, in the manner set forth.

3. The grate A having the long and bent bars B', the short front bars B provided with projections *b*, and the tilting bottom C constructed and hinged as described, the several parts combined in the manner and for the purpose set forth.

145,213.—Apparatus for the Manufacture of Starch.—THOMSON KINGSFORD, Oswego, N. Y. Application filed August 21, 1873.

A horizontal endless apron or belt is used to remove lumps of starch from one part of the factory to another, and a second to raise lumps from one story to another.

Claim.—The combination and arrangement of the horizontal endless belt D', passing over pulleys F' F', and supported by rollers E and the vertical endless belt D, to which are attached the shelves or brackets C, all constructed and operated in the manner and for the purpose specified.

145,214.—Wind-Wheel.—COLUMBUS W. KLINE, Beloit, Wis. Application filed October 2, 1873.

A rotating air-chamber for receiving and conducting the wind to the lower side of the wheel and into the buckets. This air-chamber is loosely pivoted upon the spindle, but rotates independently of the wheel.

Claim.—The combination, with the turbine wheel B and the shaft M, of the independently-rotating chamber C, with vanes V V and hinged gates L L, connected by rods a^2 a^2 to the weight O, all constructed and arranged substantially as and for the purposes herein set forth.

145,215.—Sewing-Machine.—FRIEDRICH KOCH and ROBERT BRASS, Brooklyn, assignors to JOHN BOYLE, New York, N. Y. Application filed September 23, 1873.

The curved vibrating shuttle-carrier and awl-feeding mechanism are arranged to operate at the extreme forward end of a cylindrical supporting-surface, and so constructed that the machine is specially adapted to sewing bags.

Claim.—The combination, within a semicylindrical bed, F, of the piercing and feeding awl K, shuttle S *s*, slotted oscillating shuttle-carrier E *r'*, and the awl and shuttle operating mechanisms, substantially as set forth.

145,216.—Loom Shedding Mechanism.—CHARLES H. LANDENBERGER and HENRY ATKINSON, Philadelphia, Pa., assignors to MARTIN LANDENBERGER & Co., same place. Application filed September 25, 1873.

To impart a greater range to the shedding mechanism without increasing the number of heddle-levers, each lever transmits a falling movement to one or more heddles controlled by it, and at the same time a rising movement to others, through the medium of an endless cord, or through supplemental levers.

Claim.—A witch loom in which each of the levers A is caused to move two heddles, or two sets of heddles, simultaneously in opposite directions through the medium of the devices described, or their equivalents, for the purpose specified.

145,217.—Hypodermic Syringe.—JOSEF LEITER, Vienna, Austria, assignor to FERDINAND G. OTTO and JOHN REYNDERS, New York, N. Y. Application filed November 1, 1873.

The sides of the barrel-bore are enlarged at both ends, so as to facilitate the entrance of the piston, and of the conical plug, which forms the connection between the syringe and the vial in the first instance, and then serves to connect the cannula point.

Claim.—1. The cylinder A of a hypodermic syringe, made with the enlarged ends to its bore, substantially as and for the purpose herein shown and described.

2. The combination of the conical plugs J and E, and of the plunger B and conical plug F with the cylinder A of a hypodermic syringe, as described.

145,218.—Crib for Children.—JOHN D. LEWIS, Toronto, Canada. Application filed July 24, 1873.

An upper and lower frame of such relative size that for compactness of stowage the lower can lie within the upper one; they are connected by flexible bands; the whole suspended by cords attached to springs above.

Claim.—1. The crib-bottom composed of the frame B and bands *y*, and combined with the top frame A by means of the flexible bands *z z*, substantially as and for the purpose shown.

2. The combination of the crib A, B, *y*, and *z* with the cords or suspenders D E and springs S, in the manner and for the purposes set forth.

145,219.—Vehicle-Wheel.—MARTIN LINCK, Danville, Ill. Application filed July 19, 1873.

The spokes are to be made of gas-pipe or similar hollow material.

Claim.—The within-described wheel for vehicles, consisting of the mortised felly A, of one piece, the tire B', hollow spokes B B, turned at one end and beveled at the other, recessed hub C, with inwardly-sloping shoulders *i i*, hub-cap D, and suitable bolts and nuts, all of said parts being made of iron, and constructed as herein set forth.

145,220.—Marker, Seed-Planter, and Cultivator.—CHARLES H. LOGAN and FERDINAND LOGAN, Pawling Post-Office, Pa. Application filed June 12, 1873.

The wheels and marking-plows are all adjustable to different widths. The seeding devices cease to work when the harrows are raised from the ground, a clutch being actuated by a rod, lever, and eccentric. The lifting-chains have each an elongated curved link for hooking or resting upon the rock-spindle, to support the harrow.

Claim.—1. The combination of the cross-bar of the frame, the adjustable wheels H H, and the adjustable clamps, or their equivalents, for carrying the markers, substantially as specified.

2. The combination of the seed-distributing devices, the suspended harrow F, spindle M, and eccentric *r*, operating a clutch, *u*, through the medium of a rod, *s*, and lever *t*, as specified.

3. The combination of the hopper A, its openings *b*, plate E, having openings *f*, and feed gear-wheels *g*, arranged between the plate E and the bottom of the hopper, and operating as specified.

4. The combination, substantially as described, of the rock-spindle M and the chain *l*, having elongated links *q*.

145,221.—Wooden Panel.—EDOUARD MAITRE, Veuxaulles, France. Application filed November 10, 1873.

The panel is made of small pieces or strips tongued and grooved together in ornamental patterns, inclosed between stiffening-boards, and held together by transverse pins or keys passing through the panel.

Claim.—In the manufacture of wooden panels, the employment of pieces or strips A of wood, which are united by means of tongues and grooves, and arranged in suitable patterns between entire or stiffening boards B, the whole being held together by means of pins or keys C, substantially as herein shown and described.

145,222.—Cultivator-Plow.—KENNETH MCKINNON, Pleasant Hill, Ala. Application filed May 31, 1873.

An extension-brace, clamped to the front standard and beam, passes through and tightens a fixed cross-brace, and also secures a subsoil-plow standard.

Claim.—1. The combination of the separate diagonal and annular braces G H with the plow-standard A, the beam C, and the clamping devices I and L, constructed and arranged substantially as described.

2. The brace N, in combination with the braces G H, the screw-coupling B, and the standard B, as and for the purpose described.

145,223.—Permutation-Lock.—SAMUEL MILLER, Gratis, Ohio. Application filed April 26, 1873.

A bar pivoted to the tail of the bolt is provided with a notched projection, which, when properly adjusted by one of the tumblers, engages with a revolving arm attached to the operating-shaft for the purpose of retracting the bolt. An eccentric, operated by a key, is arranged to throw the tail of the bolt above and away from the tumblers when it is desired to use the bolt as an ordinary latch.

Claim.—1. The combination of the perforated tumbler C with pins *b b* and notch *d*, the perforated tumbler D with pins *e e* and tooth *f*, the perforated disk E with arm H, and washer G with pin *i*, all constructed and arranged substantially as and for the purposes herein set forth.

2. The combination of the tumbler D, disk E, tooth *f*, and arm H with the notched projection *m* on the bar K, pivoted to the arm J, substantially as and for the purposes herein set forth.

3. The combination of the arm H on the disk E, the spoke-wheel M, and the slotted flange *n* on the bolt, substantially as and for the purposes herein set forth.

4. The combination of the bolt I, slotted flange *n*, arms J L, projection *k*, and the pivoted bar K with notched projection *m*, all constructed as described, and operating in connection with suitable tumblers, substantially as and for the purposes herein set forth.

5. The combination, with the lock-bolt arm J, having pin *y*, and the spring O, of the shaft *s*, eccentric *t*, finger *x*, spring *z*, and key P, all constructed and arranged substantially as and for the purposes herein set forth.

145,224.—Battery-Gun.—ALONZO E. MILTIMORE, United States Army. Application filed November 25, 1873.

Claim.—1. The combination, with a single central barrel, A, of a series of complete barrels, B, of smaller caliber, constructed and adapted to revolve around the central barrel A, substantially as described.

2. The combination described, of a central barrel or gun and a frame or cradle for supporting the gun at or near its extremities, so that a series of independent barrels may be arranged around said central gun, as set forth.

145,225.—Rolling-Mill.—JAMES MOORE and WILLIAM GEORGE, Philadelphia, Pa., and ALEXANDER L. HOLLEY, Brooklyn, N. Y. Application filed October 28, 1872.

The middle roll is adjusted by means of two screws, one right and the other left handed, passing through the bolster at each end, and operated by worm-gearing connected to a pulley above. The fore-plate and catch-plate are fastened to lugs on the bolster of the middle roll, and are carried by it when the roll is adjusted. A stop or lug on the bolster limits or gages the height to which the metal is to be raised by the table.

Claim.—1. In a three-high rolling-mill, a movable middle roll, adapted to be moved into and set at various positions, with reference to the top and bottom rolls, while the mill is running, for the purpose set forth.

2. The combination of the paired screws D D' and bolster C with each end of the roll F, for the purpose of moving and holding the said roll, as described.

3. In a rolling-mill having a movable roll, the fore plate and catching-plate *a a'*, secured to lugs *g g'* on the movable bolster C, so as to move therewith, as herein described.

4. In a rolling-mill having a movable roll, the combination of the bolster with a lug, stop, or other means adapted to arrest the movement of the table at a uniform position with reference to the said roll, substantially as described.

145,226.—Lubricating Device for Car-Axles.—WILLIAM J. L. MOULTON, San Francisco, Cal., assignor to JENNESS LUBRICATOR COMPANY. Application filed August 2, 1873.

Claim.—The lubricator consisting of the flexible pad-holder A, having the central trough C, springs E attached thereto, links F, and pad D, all combined as set forth.

145,227.—Car-Axle Box.—WILLIAM J. L. MOULTON, San Francisco, Cal., assignor to JENNESS LUBRICATOR COMPANY. Application filed August 2, 1873.

A felt ring is placed around the axle against the inner wall of the lubricating-chamber, in which position it is held by the inner end of the brass bearing-block.

Claim.—The felt ring C, placed against the inner wall of the oil-box, and having the axle passing through it, substantially as and for the purpose specified and shown.

145,228.—Car-Coupling.—JOHN F. MULLOWNY and SIDNEY R. BROOKS, Pittsburg, and JAMES COPE, Connellsville, Pa. Application filed May 13, 1873.

The plates which engage with the arrow-head are held together by weighted levers. Uncoupling is effected by means of a cam operated from the platform, or by levers suitably arranged beneath the platform, and a transverse bar by which they are operated.

Claim.—1. The plates C, hinged rods *b'*, and weights *b*, combined substantially as shown and described.

2. The cam E and lever F, in combination with the plates C D and hinged rods *b*, substantially as and for the purpose specified.

3. The transverse pivoted bar D', having the studs F', in combination with the arms *d'* and hinged plates C, substantially as and for the purpose specified.

145,229.—Car-Seat.—PATRICK W. NOLAN, New York, N. Y. Application filed October 30, 1873.

Claim.—1. A reversible folding-seat, O, to swing under the back B on pivoted side straps E, substantially as described.

2. The standard A, having the elongated slots D, in combination with the back B, stud C, and seat O, substantially as described, for the purpose specified.

3. The square bosses G on the seat O, in combination with seats H on the standards, substantially as and for the purpose described.

145,230.—Bill and Paper File.—THOMAS ORTON, Chicago, Ill. Application filed October 17, 1873.

Claim.—The flat spring B, having its fixed end secured to the bracket by means of the notch *a'* and screw *b*, and its free end curved inward, as shown and described, for the purpose specified.

145,231.—Lubricating Device for Vehicle-Axles.—CHRISTOPHER COLUMBUS PARKER, Kiddville, Me. Application filed April 8, 1873.

The cover to the oil-vessel can be removed without interfering with the valve, and the valve can be manipulated without interfering with the cover to any great extent.

Claim.—1. The combination, with the vessel A, having the conically-shaped valve seat, of the valve or cut-off B, the stem of which is supplied with a diaphragm, *b'*, and a handle, substantially as and for the purpose set forth.

2. The combination of the vessel A, cap or cover C *c'*, valve B *b*, having the adjustable head *s* and bale *b'*, and the diaphragm *b'*, substantially as and for the purpose specified.

145,232.—Spark-Arrester.—HENRY C. FARRALEE and SAMUEL M. JONES, Cleveland, Ohio, assignors of one-third their right to CHARLES D. EVERETT, same place. Application filed November 13, 1873.

An inverted cone, which deflects the coals and sparks, is provided with projecting circumferential disintegrators, by which the coals are broken in small particles, and also ribs with tapered holes, through which the smoke passes, the taper preventing them from being choked.

Claim.—The within-described spark-arrester, consisting of the inverted cone C having circumferential shoulders *b b*, and the shield D provided with ribs or nipples *d d*, with slots or holes X X, and the shoulders *b' b'*, all cast in one piece, substantially as and for the purposes herein set forth.

145,233.—Bridle-Blind.—JAMES PATTERSON, Jr., Bangor, Me. Application filed May 27, 1873.

Claim.—In combination with a blind or winker, the metallic plate *b*, having loops *c c* therein, through which the cheek-strap passes, said blind being adjustable upon the cheek-straps, as herein described and shown.

145,234.—Crane.—JOSEPH L. PENNOCK, Coatesville, Pa. Application filed October 15, 1873.

A cylinder, to whose piston-rod the weights to be hoisted are attached, has rollers to facilitate its traveling upon ways on the jib of the crane. The supply and exhaust ports of the cylinder communicate with the steam-boiler or compressed-air reservoir and the place of exhaust through flexible pipes.

Claim.—A cylinder, A, having wheels or rollers adapted to ways on the jib or beams of a crane, and having a piston and piston-rod constructed for direct attachment to the weight to be hoisted, in combination with pipes so arranged as to admit steam or compressed air to and exhaust it from the cylinder without interfering with the free movement of the latter or with that of the crane, all substantially as set forth.

145,235.—Cork or Stopper Holder.—GRANVILLE H. PLUMMER, New York, N. Y. Application filed November 13, 1873.

An elastic holder connected to the neck of the bottle and to the stopper, so that by means of said holder the stopper is retained in position in the mouth of the bottle, and when withdrawn prevented from being mislaid.

Claim.—An elastic holder for bottle-stoppers composed of a retaining-clasp, b, and neck-band c, which are connected to each other by side straps *d d*, all arranged and operating substantially as herein described.

145,236.—Watering-Column for Railway-Tanks.—JOHN N. POAGE, Cincinnati, Ohio. Application filed November 22, 1873.

A threaded toothed nut is placed upon and around the upper end of a valve-rod, and caused to revolve within suitable bearings by a pinion and shaft; also giving the valve-rod a vertical movement.

Claim.—The means shown for producing a vertical movement of the valve-rod D, consisting of a threaded toothed nut, F, placed upon and around the upper threaded end of said valve-rod, and caused to revolve within suitable bearings by the pinion G and shaft H, substantially as and for the purpose specified.

145,237.—Heating-Drum.—FREDERICK PROUDFOOT, Toronto, Canada. Application filed June 5, 1873.

A corrugated pipe is provided in its interior with a similarly-corrugated hot-air pipe, which is closed at its lower end and connected with the external air by short tubes, terminating in cone-shaped caps. The interior tube is provided with dampers.

Claim.—The combination of the corrugated smoke-pipe A, the core-tube or inner air-chamber C, provided with branch-tube I and dampers J, and the funnel or cone shaped cap, as shown and described, for the purpose specified.

145,238.—Toy Pistol.—HENRY M. QUACKENBUSH, Herkimer, N. Y. Application filed November 1, 1873.

The nipple is inserted in line with the axis of the barrel. The hammer is upon the recurved end of a sliding rod actuated by a spring, and working in a groove parallel with the barrel.

Claim.—The combination, in a toy pistol, of a sliding L-shaped hammer, C, having the shank *c* parallel, or nearly parallel, to the barrel, with the spring E and trigger D, all arranged to operate substantially as herein shown and described.

145,239.—Weather-Strip.—CHRISTIAN B. RAGER, North Manchester, Ind., assignor of one-half his right to HENRY MILLS, same place. Application filed September 30, 1873.

Claim.—The threshold-plate *a*, having the external hinge-flange *b* extending downward at an obtuse angle with said plate for closing the sill-joint, and the end arm *a'*, arranged at an acute angle with said plate, for raising the same to close the door-joint, as specified.

145,240.—Leather-Crossing Roller.—SILAS B. RANDALL, Cincinnati, Ohio. Application filed September 30, 1873.

A series of annular disks, having waved surfaces, are arranged upon a metallic roller, and may be readily renewed or changed, to vary the style of finish, as may be desired.

Claim.—1. A compound metallic roller having a concave periphery, *n*, and perpendicular crossing-ridges *o*, formed by sections or disks M M' N, with beveled opposing surfaces, and interposed bent annular plates O O', substantially as herein described, for the purpose specified.

2. The compound metallic roller, consisting of the clamping sleeve and nut K & L, rigid annular sections or disc M M' N, and interposed thin rings O O', forming an effective periphery, *n*, with parallel end flanges *m*, and perpendicular waved crossing-ridges *o*, substantially as set forth.

145,241.—Guitar.—GEORGE D. REED, Springfield, Vt., assignor of two-thirds his right to JULIUS E. GRAVES and WILLIARD BAILEY, same place. Application filed November 4, 1872.

The body or shell is made, back, belly, and sides, of sheet metal.

Claim.—As a new article of manufacture, a guitar having a

sheet-metal body with or without a metallic neck and strings, when constructed as herein shown and described.

145,242.—Curry-Comb.—ALBAN H. REID, Brandywine Manor, Pa. Application filed July 12, 1873.

The frame, rubbers, and tang are made of wire, bent as shown. The part of the device upon which there is little strain is not composed of as many wires as other parts.

Claim.—A curry-comb composed of a series of wires bent and twisted together, substantially in the manner described, so as to form transverse rubbers *a*, a frame, *b*, and a tang, *d*, adapted to a wooden or other handle, *f*.

145,243.—Gas-Extinguisher.—DAVID M. REYNOLDS, Port Deposit, Md. Application filed September 24, 1873.

An adjustable weighted arm is attached to the gas-cock, and connected, by a pivoted catch or trigger, with a threaded disk attached to the hour-hand shaft of the clock movement. When the trigger is released the weighted arm turns the key.

Claim.—1. The bent arm E E′, provided with an adjustable weight, H, and pin K, in combination with the trigger J and screw-threaded disk B, all arranged, constructed, and operated in the manner and for the purpose set forth.

2. The socket having a cylindrical end, and provided with ears *c c*, in combination with the arm E and thumb-screws D and F, as and for the purposes set forth.

3. In combination with the key *a*, the arm E E′ and adjustable weight H, substantially as described.

145,244.—Door-Spring.—WILLIAM T. ROESITER, Lincoln, Nebr. Application filed August 16, 1873.

The coil-spring is permanently fastened to a prismatic plug, which plug is furnished with a handle to assist in adjusting the torsion. The plug is inserted in the brackets, through slots formed for the purpose, before the latter are screwed on.

Claim.—The helical spring C, having a plug, E, permanently secured to one or both ends, and adjusting-handle *a*, in combination with the slotted brackets D D, or either of them, substantially as described.

145,245.—Guard for Preventing Leakage Around Chimneys.—JOSEPHUS F. SCHUYLER, Fostoria, Ohio. Application filed March 21, 1873.

A metallic case firmly attached to the roof surrounds the chimney at a small distance therefrom. This is covered by a cap, G, attached to the chimney a short distance above, having a flange which projects down over the roof-cap so as to exclude rain. Staples *a a*, placed in the brick-work, permit the chimney to slide through the roof without impediment when settling occurs.

Claim.—The combination, with a roof, B, of the loosely-fitted chimney A, with staples *a a* between it and the roof, the roof-cap C D, made in two parts, and the chimney-cap G, the parts being constructed and used as described, with reference to the settling of the chimney, for the purposes set forth.

145,246.—Machine for Cutting Veneers.—JOHN N. SEIM, Boston, Mass. Application filed October 2, 1873.

The machine is adjustable for cutting veneers from square or circular logs.

Claim.—1. The combination of pinions *p*, cog-wheel *s*, pitmen-rods *g*, working-beams *b*, rods *a* and A, feed mechanism *i k l m*, knife-carriage E, and log-carrier C, all constructed and operating substantially in the manner herein shown and described.

2. The standards D hinged upon the bed A, in combination with the reciprocating log-carrier C, to operate in the manner and for the purpose specified.

3. The log-retaining dogs *r*, provided with adjusting-pins *v* and set-screws *t*, in combination with the log-carrier C, substantially as shown and described.

4. The combination of the knife-carrier E with the supporting-blocks *u*, the screws *z z*, and roller-nuts *y*, all constructed and arranged as and for the purpose specified.

5. The divided log-carrier G, having the lugs *f′* and flanges *i′* and groove *g′*, in combination with the shaft *f* having the projections *h′*, substantially as and for the purpose specified.

6. The clamping-jaws *b′*, provided with grooves to engage with a tongue on the breast of the knife-carriage, in combination with the knife *a′*, clamping-screws *c′*, and set-screws *d′*, substantially as described.

145,247.—Pump.—CHIPMAN W. SHOLES and HENRY C. KELLY, Morrison, Ill. Application filed March 31, 1873.

The pump-stock and the standard are both made adjustable. By this means not only can the pump be accurately set, but the length of stroke of the piston can be changed without altering the length of the piston-rod.

Claim.—The pump-stock A, and standard B b^2 b^3 secured adjustably to the platform or cover of the well, as shown, in combination with the handle C, substantially as and for the purpose specified.

145,248.—Carbureter.—ISAAC SIMMONS, Baltimore, Md. Application filed November 21, 1873.

Claim.—1. The clips E, constructed substantially as described, in combination with the partitions C, capillary material D, and pan or pans to contain hydrocarbon liquid.

2. In a carbureting apparatus, consisting of a series of pans arranged one above another, taking the air or gas to be carbureted at top and delivering it at bottom, the guards G and screens H, constructed and arranged as described, to prevent the current of air or gas unduly agitating the liquid or carrying it from an upper to a lower pan.

3. The cup M, constructed and applied substantially as described, to prevent access to the feeding-nozzle K′, cocks L M, by unauthorized parties.

4. The pans A B A^1 B^1, constructed as herein described, with seamless bottoms and vertical corner-seams, to which access is had from end to end, as explained.

145,249.—Wire Mattress.—JOHN G. SMITH, St. Louis, Mo. Application filed September 9, 1873.

Webbing of interlocking-coils of wire having an elliptical section, and tightened by a horizontal stay-wire on each side.

Claim.—1. The wire fabric or webbing for mattresses formed of the interlocked spirals of wire having an elliptical section, with its shorter diameter radial or transverse to the coil, substantially as set forth.

2. The guys or stay-wires G G, extending from bracket B to bracket C, and connected to the sides of the webbing, substantially as and for the purpose set forth.

145,250.—Machine for Forming Wire Loops.—CHRISTOPHER M. SPENCER, Hartford, Conn. Application filed August 2, 1873.

A pair of jaws, operated by a crank and connecting-rod, seizes the wire and thrusts it forward the proper distance for a "length." The wire, lying on a table, is cut off by a chisel and forced around a pin to form a loop, the ends of which are caught under a lip on a horizontal shaft and turned up. The several devices are operated by cams on a horizontal shaft.

Claim.—1. The combination of the crank *c*, pitman *d*, bearing the cam d^3, and the reciprocating clamp, composed of the base *e*, anvil e^1, and pivoted head e^2, the whole constructed, arranged, and designed for operation and use, substantially as described.

2. The combination of the crank *c*, crank-pin c^1, and pitman *d*, having the slot d^2 for lost motion, and bearing the cam d^3, with the reciprocating clamp, composed of base *e*, anvil e^1, and pivoted head e^2, the whole constructed, arranged, and designed for operation and use, substantially as described.

3. The combination of the crank *c*, pitman *d*, bearing the cam d^3, the reciprocating clamp, composed of the base *e*, anvil e^1, and pivoted head e^2, the cam h^2, lever A, and bed h^3, all constructed and operating substantially as set forth.

4. The combination of the crank *c*, pitman *d*, bearing the cam d^3, the clamp-base *e*, anvil e^1, pivoted head e^2, cam h^2, lever A, bed h^3, cam i^2, and chisel i^1, all constructed and operating substantially as set forth.

5. The combination of the cam o^2, swage-slide o^1, having the cut-away o^3, and the pin *o*.

6. The combination of the cam o^2, swage-slide o^1, having the cut-away o^3, the pin *o*, the table *k*, and rock-shaft *n*, provided with the former *m*, all constructed and operating substantially as set forth.

7. The combination of the cam *s*, shaped as shown, the rack s^1, the pinion n^2, and the rock-shaft *n*, bearing the former *m*.

145,251.—Stove-Pipe Shelf.—WILLIAM J. STEPHENSON and DAVID W. STEPHENSON, Yellow Springs, Ohio. Application filed October 13, 1873.

A ring resting on lugs of a stove-pipe is connected by oblique legs to shelves, which are inclosed by sliding doors.

Claim.—The combination of lugs B, ring C *c*, tubular oblique legs D, and two or more compound shelves, E E′, having hooked margins F, for sliding and separable doors or shutters J, as and for the purpose specified.

145,252.—Tool-Handle.—SUMNER F. STREETER, Greenfield, Mass. Application filed December 7, 1872.

The shank of the tool is passed through a hole in the ferrule, and fastened at any angle by a screw-nut.

Claim.—A chopping-hatchet composed of a handle, A, provided with a socket, C, and a blade, F, constructed with a shank, D, fitted to and secured in said socket, and adjustable therein so as to fix said blade parallel with, oblique, or transverse to said handle to cut either right or left handed, as and for the purpose set forth.

145,253.—Stove-Grate.—DAVID STUART and LEWIS BRIDGE, Philadelphia, Pa., assignors to STUART, PETERSON & CO., same place. Application filed June 26, 1873.

The movement of the parts A A′ is limited to the depression in the bar G.

Claim.—1. The grates A A′, arranged upon the same plane, and connected together by a projection on one fitted to a recess in the other, so that the movement of one will impart a simultaneous movement to the other, substantially as described.

2. The arm E, carrying a vertical pin, D, to a socket of which is adapted the bar *a* of a revolving and tilting grate, substantially as described.

3. The within-described stove-grate, consisting of three sections—that is to say, the upper, vertical, and permanent section B, the intermediate hinged section B′, and the horizontal section for supporting the body of fuel when the intermediate section is depressed—all being combined as set forth, for the purpose specified.

145,254.—Monument.—JOSEPH C. TAYLOR, Roanoke, Ala. Application filed October 23, 1873.

Claim.—A grave-cover consisting of a base or pedestal, B, of masonry, and a slab, C, composed of hydraulic cement, sand, and water, or equivalent ingredients, to form artificial stone, the same being molded upon said base, substantially in the manner described, and for the purpose set forth.

145,255.—Construction of Railway-Cars.—KIRK THOMPSON and SYLVESTER D. BEEBEEOWER, Oxford, Pa., assignors of one-fifth to WM. L. G. THOMAS, same place. Application filed November 25, 1873.

Rolled-iron hollow sills run the length of the car, covered by top plates, which are mortised to receive the stanchions. The wooden end sills are set within the side sills, one wall of the latter being partly cut away to form the joint, which is strengthened by a bolt and nut.

Claim.—1. Hollow wrought-metal car-sills A, having the stanchions of the body seated into them, and combined substantially as described.

2. The cap-plates A′, perforated to receive the tenons of the stanchions, in combination with wrought-iron sills A, substantially as described.

3. The side and end sills united by joints constructed, locked, and clotted substantially as described.

4. The stanchions C, combined with L-plates G and V-shaped sills A, substantially as described.

5. A hollow rolled metal car-body sill A, rabbeted to and in combination with mortised cap-plates A′, substantially as described.

145,256.—Gas-Retort.—JOSEPH C. TIFFANY, Portsmouth, N. H. Application filed November 14, 1873.

Claim.—1. A retort for the generation of gas, made wholly or in part of platinum or its allied metals, for withstanding the action of heat and the gas-generating agent.

2. A gas-retort provided with a lining or jacket of platinum or its allied metals, whether the lining covers the entire or only a portion of the interior or exterior surface of the retort, substantially as set forth.

3. A gas-retort provided with a bottom of platinum, made separate from the retort-body, and attached thereto by suitable means, substantially as herein set forth.

4. In combination with a retort for generating gas, one or more perforated rose-heads or tubes, for diffusing the liquid in a spray or shower over the heated surface of the retort, as herein set forth.

145,257.—Method of Burning Gas in Furnaces.—JOSEPH C. TIFFANY, Portsmouth, N. H., assignor of one-half his right to CHARLES F. DODGE, New York city. Application filed November 14, 1873.

Claim.—1. A perforated pipe made wholly or in part of platinum, or its alloys, or of iron coated or lined with platinum, projecting into or arranged within the fire-chamber of a furnace, for conveying or distributing aeriform fluids for promoting combustion, substantially as set forth.

2. In combination with the induction steam-jet pipe, the sliding conoidal-shaped valve, adjustable upon the same for regulating the admission of air to the fire-chamber, substantially as described.

145,258.—Railway-Tie.—THEODORE R. TIMBY, Tarrytown, N. Y. Application filed September 27, 1873.

A metallic railway-chair and tie united to each other by the process of casting the chair on the end of the tie, said end being inserted in the mold, and provided with holes, into which the molten metal runs.

Claim.—The railway-tie herein described, consisting of a flat bar, E, set in a vertical or nearly vertical plane, with bearings B C D cast on its ends, in the manner described.

145,259.—Machine for Heading Hair.—ROBERT TURNEAURE, Rockford, Ill., assignor to himself and BELINDA WILLIAMS, same place. Application filed September 22, 1873.

The upper roll is either stationary or revolves in the same direction as the other, so that their surfaces resist each other in either case, and, by opposing the barbed surfaces of the hairs, push their root-ends out on either side of the machine.

Claim.—1. In a machine for separating hair, the roller C and rod C^1, both provided with elastic covers, and adapted to separate the hair by frictional resistance, substantially as and for the purpose set forth.

2. The rod C^1, in combination with the frame-piece D, spring E, and swinging arm B^2, arranged and operating substantially as described.

3. The rod C^1 and yielding covering C^2, in combination with concave plate F and frame-piece D, constructed and operating substantially as described.

4. The standards B B^1, in combination with the swinging arm B^2, frame-piece D, and bolts *b*, arranged and operating substantially as described.

145,260.—Machine for Severing Tin Cans.—HENRY T. VADEEN, Lansdale, Pa. Application filed June 7, 1873.

The cutters are circular, and are adjustable the one vertically and the other horizontally, and the can placed bottom upward over and around the one cutter is severed by the pressure and rotation of the other cutter against it.

Claim.—The combination of the knives *d* and *f*, the movable bracket E′, and gearing G′, substantially as set forth.

145,261.—Balanced Valve.—CHARLES P. WELCH and ROBERT J. OZE, Mahanoy City, Pa. Application filed August 16, 1873.

Small valves are provided in the back of the cup-valve, and through the top of the steam-chest cover, for the escape of waste steam that may leak into the cup-valve. Lost motion is compensated for by an adjustable hollow valve stem and nut.

Claim.—1. The yoke C and movable stripe *c′*, combined with the valve-stems E F, valve B, and nuts *h i′*, substantially as described.

2. The steam-escape valves *f g*, combined with the anti-friction slide-valve herein described, for the purpose described.

145,262.—Forming Hat-Bodies.—JOHN WHARTON, Newark, N. J. Application filed June 25, 1873.

The deposit of fur upon the cone is regulated by a sectional dedector hinged to the inner side of the case. The fiber is crossed by rotating the cone in opposite direction to that of the case. By the vertical adjustment of the perforated disk J, fur is thrown upon the tip and square. Air is admitted to the cone through perforations in the base of the case, the current being controlled by an annular band.

Claim.—1. An expansible dedector, B, within the case A of a machine for forming hat-bodies, substantially as described.

2. The combination of the case A and cone H, provided with gearing, substantially as described, whereby the case and cone are made to rotate in opposite directions, as set forth.

3. The combination of the case A, cone H, and dedectors B and *j*, substantially as described.

4. The combination, in a machine for forming hat-bodies, of the case A, having its lower portion provided with perforations, and a slide, W, the cone H, expansible dedector B, and the adjustable dedector *j*, all constructed and combined substantially as described.

145,263.—Pipe-Wrench.—HENRY B. WHEATCROFT, New York, N. Y., assignor to J. AUSTIN & CO., same place. Application filed September 25, 1873.

Claim.—In combination with the curved lever-bar *a*, serrated on its convex side at a distance from the end, the dog *c*, having the re-enforcing clips *f f*, and pivoted to the extreme end of the bar, and pressed backward by the spring A against the serrated surface *g* on the side of the bar, the whole arranged and operating substantially as shown and described.

145,264.—Journal or Shaft Hanger.—JOSEPH WHITAKER, Woonsocket, R. I., assignor to SIMEON S. COOK, same place. Application filed October 22, 1873.

Claim.—The combination of the glass indicator or feed-tube F with the movable elbow-pipe E and oil-box having reservoir D, substantially as shown and described.

145,265.—Process of Separating Silver from other Metals.—CONRAD WIEGAND, Virginia City, Nev. Application filed August 1, 1873.

The mixed metals are ground in quicksilver to form an amalgam, washed to remove iron and other substances not readily soluble in mercury. The amalgam, dissolved in an excess of mercury, is fed into an upright vessel surrounded by a heating-jacket having a close cover, means for introducing and agitating the amalgam and mercury, and provided with a strainer, undergoes what is termed leaching or hot filtration. The amalgam remaining on the strainer will contain gold, copper, &c. The silver, passing through with the excess of mercury, is submitted to a second or cold filtration.

Claim.—1. The process herein described for separating or refining silver, through a more or less complete separation of its amalgam from the amalgams of other metals, by leaching them with quicksilver, while warm or hot, in or upon a strainer, and subsequently straining the filtrate cold.

2. The process of heating, straining, and cooling the amalgams herein described, without allowing either the amalgam or quicksilver to come in contact with water or other cooling liquids or mixtures, substantially as and for the purpose set forth.

145,266.—Bedstead-Fastening.—CALMAN WOLF, Rochester, N. Y. Application filed November 7, 1873.

A hook, recessed in the rail, is passed over a pin in the post, and tightened thereon by the revolution of a nut, otherwise stationary, on a screw on its rear end.

Claim.—1. The nut G, having a screw-socket, *a*, rim *g*, and stem A, in combination with the hook D, having shoulder *c*, screw *d*, and head *e*, substantially as and for the purpose specified.

2. The combination of the eccentric washer with the nut G, having a screw-socket, and the hook D, having the screw *d* and head *e*, constructed and arranged substantially as described.

145,267.—Gas-Retort.—JAMES WOTHERSPOON and WILLIAM FOULIS, Glasgow, North Britain. Application filed August 23, 1873.

Claim.—1. The combination, with the hinged lid A, of a catch, F, and eccentric I operating on the catch, so as to first raise the same into contact with a projection on the lid, and then draw the latter against the mouth of the retort, as specified.

2. The combination, with the recessed lid or retort, of a packing of asmianthus, combined with and strengthened by wire, as set forth.

REISSUE PATENTS.

5,671.—Grain-Car Door.—CHARLES BARKER, Maquon, Ill., assignor to himself and THOMAS C. THOMAS, same place.—Patent No. 103,126, dated May 17, 1870; antedated May 13, 1870; reissue No. 5,206, dated December 31, 1872. Application filed November 12, 1873.

Claim.—1. In combination with a railroad-car, a door arranged to turn edgewise across the opening C, substantially as and for the purpose specified.

2. The opening *d* in the frame of a railroad-car, in rear of the door, for the purposes set forth.

3. A pivoted door for railroad-cars, with the outer points of

the door equidistant from the pivot on which it turns, substantially as and for the purposes herein set forth.

4. The car A, pivoted door B, grooves *m*, and opening *d*, all constructed and arranged as and for the purpose set forth.

5,672.—Gate for Gang for Marble-Saws.—LUCIUS B. CLOGSTON, West Rutland, Vt., assignor of one-half interest to CHARLES H. SHELDON, same place.—Patent No. 119,968, dated October 17, 1871; antedated September 30, 1871. Application filed November 15, 1873.

The ends of the tubular side-supports of the gate are connected by couplings, which engage with the wrought-iron channeled head-block.

Claim.—1. Intermediate couplings B, as means for connecting the ends of channeled-iron head-blocks A A to tubular side pieces C C of a saw-frame, substantially as described.

2. In a frame for gang-saws for marble manufacture, the head-block of wrought and channeled iron, constructed substantially as specified.

5,673.—Machine for Threading Screw-Blanks.—EDWARD CROFT, Waterbury, Conn.—Patent No. 142,500, dated September 9, 1873. Application filed November 12, 1873.

The screw-blanks are threaded by being rolled between the two die-faces, the configuration of which is that described in the claims, the increased pitch of the grooves corresponding to the elongation of the blank.

Claim.—1. The combination of two converging dies having longitudinal indenting-ridges of progressively-increasing pitch, substantially as before set forth.

2. The combination of two converging dies having longitudinal ridges of progressively-increasing pitch, and also profiles which are concave at the sides, which correspond with the point of the screw, substantially as before set forth.

5,674.—Saw-Frame.—DANIEL MOORE and EDWIN MOORE, Brooklyn, E. D., N. Y., assignors to THE BISSELL AND MOORE MANUFACTURING COMPANY, New York city.—Patent No. 94,500, dated September 7, 1869; reissue No. 4,276, dated February 21, 1871. Application filed November 17, 1873.

The saw is properly strained by the action of the turn-buckle and the double-braced rods D.

Claim.—The frame sides A A', a saw, B, and a tightener, *c*, in combination with the thrust-brace D, having the four points of bearing in the frames A A', between the tightener and saw, substantially as and for the purpose specified.

5,675.—Vegetable-Scoop.—JOHN F. UNGLISH, Webster, N. Y., assignor of one-half interest to JAMES E. THOMPSON, same place.—Patent No. 100,822, dated March 15, 1870. Application filed November 10, 1873.

A ring attached to a suitable handle, and having bars, with a guard extending from the sides of the scoop to the handle.

Claim.—A vegetable-scoop consisting of the rim A, provided with the stem or shank *a*, cross-bars *b*, guards *d*, and handle D, arranged substantially as and for the purpose set forth.

5,676.—Cultivator.—RICHARD B. ROBBINS, Adrian, Mich.—Patent No. 141,462, dated August 5, 1873. Application filed October 13, 1873.

The front ends of the drag-bars are provided with spiral springs to permit a free lateral motion of the frame, the side frames being connected by a double cross-head bearing additional plows. Anchor-shaped hooks suspend the beams.

Claim.—1. The springs *w w w w*, in combination with the swinging frames D D and pendent arms *o*, for the uses and purposes described.

2. The double cross-head H, in combination with the inner rails of the swinging frames D D, for the uses and purposes described.

3. The anchor-shaped pendent hooks *s*, in combination with the staples *f*, when used in a lateral-moving cultivator, substantially as described.

4. The metallic shanks *i* of the drag-bars, passing through the eyes of the pendent arms *o*, in combination with adjusting-nuts and spiral springs, substantially as described.

INDEX OF INVENTIONS PATENTED DEC. 2, 1873.

	Class No.	Whole No.
Axle for vehicles, H. Frederick	31	145,165
Axles, lubricating device for vehicle, C. C. Parker	31	145,231
Bale tie, L. Carter	7	145,091
Battery, non-freezing, E. H. Ashcroft	50	145,143
Bed, mattress, &c., filling, J. C. Wightman	62	145,140
Bedstead fastening, C. Wolf	62	145,266
Bee hive, D. McC. Calvin	9	145,048
Bill and paper file, T. Orton	146	145,230
Boiler for vaporizing volatile fluids, J. F. Haskins	47	145,175
Boilers, heater for steam, D. Coughlin	149	145,095
Bolt for doors and gates, J. Smith	24	145,131
Boot or bootee, T. F. Mitchell	16	145,117
Bottle, easter, A. Weber	88	145,138
Bracelet, A. Febes	86	145,164
Brick machine, Goldthorp and Hield	30	145,169
Bridges, truss frame for, J. H. Linville	21	145,114
Bridle blind, J. Patterson, Jr.	72	145,233
Cans, machine for severing tin, H. T. Vadera	88	145,260
Car axle box, J. E. Bering	122	145,146
Car axle box, W. J. L. Moulton	122	145,227
Car axles, lubricating device for, W. J. L. Moulton	87	145,226
Car coupling, J. C. Maloy	122	145,067
Car coupling, Malloweay, Cope, and Brooks	122	145,228
Car door, grain, C. Barker, (reissue)	121	5,671
Car, railway, Thompson and Beerbrower	121	145,255
Car seat, P. W. Nolan	122	145,229
Car, sleeping, G. H. Lindner	121	145,113
Car starter, V. Wirick	122	145,076
Car trucks, safety attachment for, G. O. Offen	122	145,123
Carburetor, I. Simmons	47	145,248
Carpet rag looper, J. F. Cooper	95	145,094
Carriage top joint, Stirling and Pohlman	31	145,135
Chain machine, F. Leonard	69	145,063
Chain links, machine for bending, D. Roy	60	145,072
Chandeliers, drop light for, C. E. Cornelius	64	145,053
Chimneys, guard for preventing leakage around, J. F. Schuyler	4	145,245
Churn dasher, A. J. Hudson	45	145,107
Clasp, J. H. Eastman	23	145,097
Clasp for elastic bands, R. P. Staats	23	145,073
Clasp for supporting stockings, &c., J. E. Treat	23	145,074
Column, fire proof, T. Hyatt	31	145,180
Comb, hand, D. N. Eopes	161	145,071
Cork or stopper holder, G. H. Plummer	1	145,235
Crane, J. L. Peaneck	79	145,234
Crib, child's, J. D. Lewis	62	145,218
Cultivator, R. B. Robbins, (reissue)	43	5,676
Cultivator, hand, S. A. Conrad	114	145,153
Currycomb, A. H. Reid	144	145,242
Cylinders, machine for facing, Henderson and McDonald	100	145,103
Dental drilling machine, C. E. Edwards	46	145,098
Dental forceps, C. G. French	46	145,058
Dental plugger, J. T. Codman	46	145,051
Dish washer, C. Bartlett	88	145,042
Door, illuminating, T. Hyatt	4	145,183
Drawing board trestle, J. H. Harden	54	145,174
Ear muff, S. Goge	38	145,168
Earthworks, machine for building, H. Morey	51	145,119
Egg carrier, F. M. Wade	116	145,137
Engine, caloric, N. A. Otto	1	145,123
Fire arm, breech loading, L. Conroy	55	145,154
Fire arm lock, D. Moore	55	145,118
Fire place grate, J. E. Wood	154	145,141
Floor and roof, fire-proof, T. Hyatt	4	145,181
Floor and wall, fire-proof, J. Johns	4	145,211
Furnace door, J. M. Clark	149	145,150
Garter and belt, coil spring, J. M. Ellis	38	145,160
Gas extinguisher, D. M. Reynolds	64	145,243
Gas retort, J. C. Tiffany	66	145,256
Gas retort, Wotherspoon and Foulis	66	145,967
Gases in furnaces, burning, J. C. Tiffany	149	145,257
Gate, E. Hickman	52	145,104
Gear or universal joint, spherical, T. Weaver	67	145,075
Generator, steam and vapor, R. Brereton	146	145,066
Glassware, manufacture of, A. H. Baggs	68	145,144
Glove, gauntlet, F. Farrant	38	145,099
Grain conveyer, C. Lazarevitch	79	145,112
Grate, S. Kepner	154	145,212
Guitar, G. D. Reed	108	145,241
Gun, battery, A. E. Miltimore	105	145,224
Gunpowder, manufacture of, F. Burney	71	145,149
Hair, machine for heading, E. Hough	54	145,060
Hair, machine for heading, R. Tarneaure	54	145,259
Hair, manufacture of crimped, Demisthorpe and Clarke	161	145,056
Hame fastener, J. G. Fleming	72	145,163
Harvester, E. H. Clinton	74	145,050
Hat, adjustable, I. Y. Cassiano	38	145,092
Hat bodies, forming, J. Wharton	76	145,262
Hat shearing machine, R. Cooke	76	145,052
Hatchway door, metallic, T. Hyatt	4	145,184
Heater, feed water, Hale and Whitney	148	145,059
Heater, steam, W. M. Fuller	147	145,167
Heating drum, F. Proudfoot	154	145,237
Heel breasting machine, Jaquith and Wolohan	16	145,061
Hog tongs, H. W. Hill	95	145,105
Horn to resemble whalebone, treating, W. Birch	25	145,045
Horseshoe, R. K. Jordan	50	145,109
Hub boring machine, D. B. Wright	31	145,142
Iron, hardening the surface of, R. T. King	85	145,110
Jack, wagon, M. Buck	79	145,046
Jewelry, diamonds, &c., chemical compound for cleaning, Langley and Stickney	35	145,065
Journal or shaft hanger, J. Whitaker	87	145,264
Knife, table, W. H. Andrew	44	145,080
Knitting machine, L. Woodward	89	145,079
Lamp, R. Hitchcock	90	145,176
Last, shoe, P. P. Paul	16	145,124
Lock, permutation, H. Gross	93	145,171
Lock, permutation, S. Miller	93	145,223
Loom shedding mechanism, Landenberger and Atkinson	95	145,216
Marker, seed planter, and cultivator, C. H. and F. Logan	133	145,220
Mattress, wire, J. G. Smith	62	145,249
Medical compound, J. C. Burroughs	98	145,047
Medical compound, L. Kappler	98	145,062
Meter, liquid, T. A. and J. S. Curtis	167	145,096
Mill, rolling, Moore, George, and Holley	125	145,225
Mill, rolling, W. and G. H. Sellers	125	145,129
Monument, J. C. Taylor	54	145,254
Mucilage cup, J. E. Crosby	146	145,155
Oil tanks, &c., extinguishing fire in, J. W. Stanton	35	145,134
Organ, reed, G. Woods	106	145,078
Paint compound, C. A. Sitzler	107	145,130
Panel, wooden, E. Maitre	68	145,221
Paper bag machine, J. P. Raymond	109	145,125
Paper pulp washing machine, S. and J. Deacon	108	145,159
Pen, fountain, H. N. Hamilton	146	145,102
Photograph burnisher, C. B. Conant	111	145,152
Photograph burnisher, W. G. Entrekin	111	145,161
Pipes, trap for steam, M. T. Davidson	150	145,157
Plane, bench, Huber and Flickinger	30	145,106
Planter, corn, Martin and Ferguson	133	145,115
Plate, flexible sheet metal illuminating, T. Hyatt	196	145,185
Plow, R. A. Brown	114	145,088
Plow, J. B. Norris	114	145,190
Plow, cultivator, K. McKinnon	114	145,222
Plow, riding attachment for, A. H. Ballagh	114	145,083
Plow, rotary, Hoffmeyer and Schmidt	114	145,177
Plow, sower attachment to, J. Brown	133	145,148
Plow, wheel, Bingham and Pond	114	145,147
Pocket, safety, H. L. Hopkins	38	145,178
Printing press, W. H. Golding	117	145,101
Propulsion of vessels by direct action of steam, G. W. Jones	139	145,210
Pump, Sholes and Kelly	118	145,247
Pump box, W. A. Spooner	118	145,133
Purifier, middlings, A. R. Guilder	57	145,170
Putty blower, N. Joseph	143	145,109
Railway rails, utilizing old, G. Frits	195	145,166
Railway tanks, watering column for, J. N. Poage	167	145,226
Railway tie, T. R. Timby	190	145,258
Railway time signal, Fend and Stevenson	120	145,057
Refrigerator, R. Armiger	58	145,081
Refrigerator, Lorenz and Bender	58	145,066
Refrigerator, R. S. Root	58	145,127
Roller, leather creasing, S. B. Randall	92	145,240
Roofing plate, ventilating illuminating, T. Hyatt	196	145,186
Ruler and blotter, combined, T. Merrill	146	145,068
Salver, A. H. Baggs	68	145,145
Sash balance, C. Harbaugh	24	145,173
Saw frame, D. and E. Moore, (reissue)	136	5,674
Saw, scroll, H. L. Beach	130	145,084
Saw set, J. N. Briggs	131	145,087
Saws, gate for gangs for marble, L. B. Clogston, (reissue)	153	5,672
Scoop, vegetable, J. F. Unglish, (reissue)	141	5,675
Screw blanks, machine for threading, E. Croft, (reissue)	171	5,673
Screw blanks, machine for threading, Nugent and Fanning	171	145,121
Screw for knobs, making double pointed, C. H. Thurston	171	145,136
Separating silver from other metals, process of, C. Wiegand	3	145,205
Sewers, cleaning, B. Latham	51	145,111
Sewing machine, Koch and Braes	134	145,215
Shaft coupling, J. Gibbins	87	145,100
Signal, railway time, Fend and Stevenson	120	145,057
Sink, H. Miller	8	145,069
Soda water fountain, F. W. Weisebrock	1	145,139
Soldering tool, L. Cutting	136	145,156
Spark arrester, Parmelee and Johns	94	145,232
Spring, door, W. T. Rossiter	94	145,244
Starch, apparatus for the manufacture of, T. Kingsford	145	145,213
Steps, illuminating ventilating, T. Hyatt	4	145,309
Stereotype plates in casting, blocking, M. J. Hughes	104	145,179
Stockings, clasp for supporting, J. E. Treat	23	145,074
Stove, cooking, R. H. Brown	154	145,089
Stove doors, attachment for, W. O. Smith	154	145,132
Stove for smoke houses, I. N. Deardorff	154	145,054
Stove grate, W. Hagerty	154	145,172
Stove grate, Stuart and Bridge	154	145,253
Stove pipe shelf, W. J. and D. W. Stephenson	154	145,251
Syringe, hypodermic, J. Leiter	156	145,217
Table, extension, A. F. Chubbuck	63	145,049
Table, ironing, E. S. Farson	91	145,162
Telegraph cut out, W. G. Linn	50	145,064
Telegraph register, W. H. Sawyer	50	145,128
Thrashing machine, concave for, L. C. Bickings	159	145,044
Tile, fire-proof illuminating, T. Hyatt	196	145,182
Tool handle, S. F. Streeter	49	145,252
Toy pistol, H. M. Quackenbush	143	145,238
Track clearer, F. Base	122	145,090
Trap, animal, H. H. C. Arnold	143	145,082
Trap, fly, H. L. Chapman	143	145,093
Trenches, extensible brace for supporting, S. G. McKiernan	51	145,116
Trenches, extensible brace for supporting, W. Reilly	51	145,196
Turpentine from sawdust, production of, S. L. Cole	47	145,151
Valve, balanced, Welsh and Orr	152	145,261
Vault cover, elevating, T. Hyatt	4	145,307
Vault cover, illuminating, T. Hyatt	4	145,187 to 145,308
Vault cover, illuminating, T. Hyatt	4	145,305
Vault cover, non-condensing illuminating, T. Hyatt	4	145,303
Vault cover, non-condensing illuminating, T. Hyatt	4	145,304
Vault cover, non-condensing illuminating, T. Hyatt	4	145,306
Vault plate, flexible illuminating, T. Hyatt	4	145,308
Vehicle shaft, J. J. Dewey	31	145,055
Vehicle wheel, M. Linck	31	145,219
Veneer cutting machine, J. N. Seib	174	145,246
Watch, stem winding and setting, U. Mardin	36	145,070
Weather strip, C. B. Ragor	20	145,239
Whiffletree, harness, O. T. Beecher	72	145,043
Windmill, Davis and Morgan	118	145,156
Wind wheel, C. W. Kline	118	145,214
Winnower, reciprocating, Wirts and Gebhardt, Jr.	159	145,077
Wire loops, machine for forming, C. M. Spencer	170	145,250
Wrench, W. C. Bemis	100	145,085
Wrench, pipe, H. B. Wheatcroft	100	145,263

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED DEC. 2, 1873.

American District Telegraph Co., The, assignee	145,122
Andrew, W. H., Table knife	145,060
Armiger, R., Refrigerator	145,081
Arnold, H. H. C., Animal trap	145,082
Ashcroft, E. H., Non-freezing battery	145,143
Atkinson and Landenberger	145,216
Austin & Co., J., assignee	145,263
Baggs, A. H., Manufacture of glassware	145,144
Baggs, A. H., Salver	145,145
Bailey, W., assignee	145,241
Ballagh, A. H., Riding attachment for plows	145,083
Barker, C., Grain car door, (reissue)	5,671
Bartlett, C., Dish washer	145,042
Beach, H. L., Scroll saw	145,084
Beach Wheel Horse Rake Manufacturing Co., assignee	145,264
Beecher, C. T., Harness whiffletree	145,043
Beerbrewer and Thompson	145,255
Bemis, W. C., Wrench	145,085
Bender and Lorenz	145,086
Bering, J. E., Car axle box	145,146
Bickings, L. C., Concave for thrashing machines	145,044
Bingham, J., and O. M. Pond, Wheel plow	145,147
Birch, W., Treating horn to resemble whalebone	145,045
Bissell and Moore Manufacturing Co., The, assignee, (reissue)	5,674
Boyle, J., assignee	145,215
Brass and Koch	145,215
Brereton, R., Steam and vapor generator	145,066
Bridge and Stuart	145,253
Briggs, J. N., Saw set	145,087
Brooks, Mullowny and Cope	145,088
Brown, J., Sower attachment to plows	145,148
Brown, R. A., Plow	145,089
Brown, R. H., Cooking stove	145,090
Buck, M., Wagon jack	145,046
Burney, F., Manufacture of gunpowder	145,149

PATENT CONVENTION.

The following call has been issued by the members for the United States of the standing committee of the Vienna International Patent Congress, announced in OFFICIAL GAZETTE, Nos. 17 and 18, vol. 4, October 21 and 28, 1873:

"The difficulties to which American inventors are subjected in attempts to secure some protection for their inventions in foreign countries are well known. The unsatisfactory condition of legislation relating to patents has been the theme of discussion in many quarters within the last few years, especially as the frequent recurrence of international expositions has made the defects therein more and more apparent.

"In connection with the late exposition at Vienna there was convened an international congress for the purpose of considering the subject of patent protection for inventions. This congress appointed a permanent committee, the members of which were authorized to organize branch associations in their respective countries, and, in general, to adopt measures in aid of the movement inaugurated at Vienna.

"The resolutions adopted by that congress have already been published in this country, and will be recognized as embodying, with some few exceptions, the principles of the American system. The interest manifested in the discussion of the resolutions and the unanimity with which they were adopted, afford encouraging signs of ultimate success, in which none are more deeply interested than the inventors of this country. But our friends abroad greatly need the information and aid which we can readily furnish, for we are the foremost nation in the world in the liberality and success of our patent system.

"Under the authority vested in us, we, therefore, invite all those interested in any way in the subject of patent protection to assemble in convention at Washington, D. C., on Thursday, January 15, 1874, for the purpose of discussing this topic, and, if thought desirable, of organizing a United States Patent Association.

"J. M. THACHER,
"HAMILTON A. HILL,
"WILLIAM P. BLAKE,
"*Of the committee.*"

CASE OF THOMAS H. UPPERMAN.

U. S. PATENT OFFICE,
December 19, 1873.

Order of the Commissioner of Patents refusing to recognize Thomas H. Upperman, or any firm of which he is a member, as a patent agent.

U. S. PATENT OFFICE,
December 18, 1873.

The following charges and specifications were, on or about the day of their date, duly served upon Thomas H. Upperman, of Washington, D. C., a patent agent practicing before the United States Patent Office:

U. S. PATENT OFFICE,
WASHINGTON, D. C., *October* 8, 1873.

Thomas H. Upperman, Esq.:

SIR: You are hereby notified to appear before the Commissioner of Patents, on or before Thursday, the twenty-third day of October, 1873, and show cause, if any exist, why the Commissioner of Patents, in virtue of the authority conferred upon him by the seventeenth section of the act of Congress approved July 8, 1870, and entitled "An act to revise, consolidate, and amend the statutes relating to patents and copyrights," should not refuse longer to recognize you as a "patent agent,"

by reason of "gross misconduct," more particularly with reference to the matters hereinafter named in charges and specifications:

CHARGE I.—That he, the said Thomas H. Upperman, in his practice as agent or attorney before the U. S. Patent Office, has wilfully, fraudulently, and corruptly withheld or misappropriated money paid to and received by him as a fee or fees of the U. S. Patent Office.

Specification first to Charge I.—That on or about the eighteenth day of March, 1873, one James Rice, of Batavia, Clermont county, Ohio, for whom the said Thomas H. Upperman was then acting as his authorized agent or attorney in the matter of a certain application for patent for an improvement in "Horse-Powers," filed October 17, 1872, and passed for issue October 30, 1872, paid to him, the said Thomas H. Upperman, as the final Office fee in said case, to be applied by him as such, the sum of $20.00, which sum was never so applied by him in said case, but was wilfully, fraudulently, and corruptly withheld or misapplied, and the said application thereby became forfeited.

Specification second to Charge I.—That on or about the twenty-sixth day of January, 1872, one Susan H. Hackley, of Grand Ledge, Eaton county, Michigan, for whom the said Thomas H. Upperman was then acting as her authorized agent or attorney in the matter of a certain application for patent for an improved "Hair Tonic," filed September 25, 1871, and passed for issue November 1, 1871, paid to him, the said Thomas H. Upperman, as the final Office fee in said case, to be applied by him as such, the sum of $20.00, which sum was never so applied by him in said case, but was wilfully, fraudulently, and corruptly withheld or misapplied, and the said application thereby became forfeited.

Specification third to Charge I.—That on or about the twelfth day of October, 1872, one Lewis M. Lusk, of Perryville, Ashland county, Ohio, for whom the said Thomas H. Upperman was then acting as his authorized agent or attorney, in the matter of a certain application for patent for an improved "Tie-Lifter," to be filed in the Patent Office by the said Thomas H. Upperman, paid to him, the said Thomas H. Upperman, the sum of $15.00 as the first Office fee in said case, to be applied by him as such, which sum was never so applied by him in said case, but was wilfully, fraudulently, and corruptly withheld or misapplied.

Specification fourth to Charge I.—That on or about the fourth day of August, 1873, Messrs. Scott and Hiltz, of Calais, Maine, for whom the said Thomas H. Upperman was then acting as their authorized agent or attorney in the matter of a certain application for patent for an improvement in "Fire-Escapes," filed June 23, 1873, and passed for issue July 12, 1873, paid to him, the said Thomas H. Upperman, as the final Office fee in said case, to be applied by him as such, the sum of $20.00, which sum was never so applied by him in said case, but was wilfully, fraudulently, and corruptly withheld or misapplied.

Specification fifth to Charge I.—That on or about the ninth day of July, 1872, one Francis Balduc, of St. Anne, Kankakee county, Illinois, for whom the said Thomas H. Upperman was then acting as his authorized agent or attorney in the matter of a certain application for patent for an improvement in "Corn-Planters," to be filed in the Patent Office by the said Thomas H. Upperman, paid to him, the said Thomas H. Upperman, the sum of $15.00 as the first Office fee in said case, to be applied by him as such, which sum was never so applied by him in said case, but was wilfully, fraudulently, and corruptly withheld or misapplied.

CHARGE II.—That he, the said Thomas H. Upperman, in his practice as a "patent agent," has wilfully, fraudulently, and corruptly withheld or misappropriated money paid to and received by him as a fee or fees of the Canadian Patent Office.

Specification first to Charge II.—That on or about the third day of December, 1872, one Lewis M. Lusk, of Perryville, Ashland county, Ohio, for whom the said Thomas H. Upperman was then acting as his authorized agent or attorney in the matter of a certain application for improvement in "Lifting-Jacks," to be filed in the Canadian Patent Office by the said Thomas H. Upperman, paid to him, the said Thomas H. Upperman, the sum of $116.00 as the Office fee or fees in said case, to be applied in whole or in part as such, which sum or any part thereof was never applied by him in said case, but was in whole or in part wilfully, fraudulently, and corruptly withheld or misapplied.

Specification second to Charge II.—That on or about the thirteenth day of January, 1873, one C. L. Wood, of Calais, Maine, for whom the said Thomas H. Upperman was then acting as his authorized agent or attorney in the matter of a certain application for patent for improvement in "Snow-Plows," to be filed in the Canadian Patent Office by the said Thomas H. Upperman, paid to him, the said Thomas H. Upperman, the sum of $46.58, and afterward, on or about the twenty-ninth day of January, 1873, the sum of $20.00, to be applied in whole or in part as the Office fee or fees in said case, which sums, or any part thereof, were never applied by him in said case, but were, in whole or in part, wilfully, fraudulently, and corruptly withheld or misapplied.

Specification third to Charge II.—That on or about the twelfth day of March, 1873, Messrs. Scott and Hiltz, of Calais, Maine, for whom the said Thomas H. Upperman was then acting as their authorized agent or attorney in the matter of a certain application for patent for improvement in "Fire-Escapes," to be filed in the Canadian Patent Office by the said Thomas H. Upperman, paid to him, the said Thomas H. Upperman, the sum of $66.50, to be applied in whole or in part as the Office fee or fees in said case, which sum, or any part thereof, was never so applied by him in said case, but was, in whole or in part, wilfully, fraudulently, and corruptly withheld or misapplied.

M. D. LEGGETT,
Commissioner of Patents.

The hearing was postponed until the fifteenth of November, ultimo, when the accused asked a further postponement of thirty days, to enable him "to answer the charges in the several papers, or to make good to clients and Office the amounts therein named," which was granted. On December 15, the accused asked a still further postponement, saying: "I cannot truthfully deny any of the allegations entirely, but yet I can as truthfully and earnestly say, that in no single act of mine, since I have been a practitioner before the Office, was wilful fraud *intended* toward my clients." Being informed, by letter from the Commissioner of the same date, that no sufficient reason was shown for granting further delay, the accused, on December 16, instant, addressed a letter to the Commissioner, in which he said: "I do not ask that you longer recognize me as a practitioner before the Office, because you are only performing your duty;" but requested to be allowed "to make the several sums good to Office and clients" without having his "name published as defrauding both, when no fraud was intended."

Upon a careful examination of the proofs and the records of the Office, it appears that the foregoing charges and specifications are fully proved, and they are also fully confessed, except as to the intent. The acts are admitted to have been done as charged, but a *fraudulent* motive is denied. This denial, however, consists in the mere statement of the accused, not under oath, and is the old story of the dishonest appropriation of the money of others, held in trust, with the expectation, perhaps, if fortunate, of replacing it. But the fraud and crime are in the acts of misappropriation, and cannot be excused by an alleged intent to return the money, which alleged intent, notwithstanding the extensions of time that have been granted, has not been followed up by the actual return of a single cent. In the meantime, the stream of complaints from other victims, upon which additional charges should be based, has continued to flow into the Office, even to the very last day set for hearing these charges.

There appears no palliation of the offenses herein charged, proven, and confessed, and it is therefore adjudged—

I. That the said Thomas H. Upperman has been guilty of such "gross misconduct" as to demand that the Commissioner of Patents shall refuse longer to recognize him as a "patent agent," and it is accordingly ordered, in virtue of the authority conferred upon the Commissioner of Patents, under section seventeen of the act approved July 8, 1870, that the said Thomas H. Upperman, or any firm of which he may be a member, be hereafter forbidden to practice before the Patent Office in any and all cases.

II. The examiners before whom any cases are now pending, or may be hereafter filed, in which the said Thomas H. Upperman, or any firm of which he is a member, may be acting as attorney, will at once notify the applicants, by letter forwarded to their own proper address, of the above order.

M. D. LEGGETT,
Commissioner of Patents.

Approved:
C. DELANO,
Secretary of the Interior.

DIGEST OF FOREIGN PATENT LAWS.

APPENDIX.

Extract from the Würtemberg General Industrial Code of 1836, containing the Laws and Regulations relating to Inventions and Patents.

ARTICLE 141. Patents may be granted by the government for the invention of a new manufacture, or of a new medium or method of manufacture; also for the first introduction of any such invention, provided it is worked only under the protection of a patent abroad.

ART. 142. The exclusive right accorded by a patent for invention or for introduction may not be infringed by another person during the period for which it is granted.

ART. 143. Any one desirous of obtaining a patent for invention or for introduction must deliver his petition at the government district office (Bezirk's Amt) of his domicile in Würtemberg, or of the place where he proposes to establish the manufacture in question; and to this petition must be annexed an exhaustive and true description of the thing for which he seeks to obtain a patent, together with such drawings, models, or samples as are necessary for the purpose of illustration; and he must specially indicate in the description the means and qualities in which the subject-matter of the petition manifestly differs from others which have already been in use, or have been introduced. This specification may be inclosed under seal, and in that case is not to be opened at the district office.

ART. 144. A certificate acknowledging the receipt of the petition is to be given to the person presenting it, stating the day and hour when it was received; but the petition itself, with the specification and inclosures accompanying it, is to be forwarded to the central board of trade and commerce, with a statement of the time when it was received.*

ART. 145. A patent applied for in accordance with these regulations will be granted, except in the following cases:

1. When the process for which it is sought to obtain a patent, or the means which are to be employed for the purpose, are shown to be at variance with existing laws;

2. When a patent for the same thing has already been previously issued;

3. When the alleged invention has notoriously been already in use in Würtemberg.

ART. 146. The period for which a patent is granted must not exceed ten years. An exclusive privilege for a longer term than the above can be accorded only by an act of parliament. The grant of a patent is to be publicly notified.

ART. 147. The specification which is sent in of the thing patented may, during the term of the patent, without the consent of the patentee—

1. Be communicated to the functionary, should he require it for his use, who is called upon to decide in any dispute arising in respect to the patent; and,

2. Be submitted to the inspection of another person, subject to the following conditions:

(*a*) That, in the case of patents for invention, the last year of the period for which they were granted shall have commenced; and, in the case of patents for introduction, that the first half of the period shall have elapsed;

(*b*) That the person applying to inspect the specification be a Würtemberg subject, and resident in the country;

* A direct report is to be immediately sent to the ministry of the interior announcing the receipt of the petition for a patent, with the name, condition, and domicile of the applicant, or of his representative in Würtemberg, (if a foreigner;) describing the nature of the patent, and stating the day and hour when the application was received. (*Ministerial Instruction of April 24, 1850.*)

(c) That the said person shall prove that he has an interest in obtaining a knowledge of the specification; and,

(d) That he shall give sufficient security that he will neither work the invention himself nor furnish any other person, within the Kingdom or abroad, with the means and opportunity of working it, during the term of the patent, without the consent of the patentee.

Previous notice must be given to the patentee before a request to inspect a specification is acceded to; and a sufficient time must be allowed him to urge any objections to it.

ART. 148. An annual tax of from five to twenty florins ($2.05 to $8.20) is payable for a patent during the period for which it is in force; the first payment is to be made when the patent is issued, and it is to be repeated at the commencement of each year of the period. When a patent ceases to be valid, before the expiration of the term for which it was granted, the patentee is released from the payment of the tax for the year which has not yet fallen due.

(Section 121 of the ministerial order of March 20, 1851. Foreigners applying for patents must furnish the authority to which they deliver their application, (Article 143,) with a reference to some native of Würtemberg, who will be responsible for the payment of the patent tax.)

ART. 149. Any one who has obtained a patent for less than ten years can obtain an extension for that term by applying for it, before the beginning of the last year, and, in respect to patents for introduction, before the expiration of the first half of the period for which it was originally granted. A tax, as prescribed by Article 148, is payable for every year of extension. The extension of a patent and the fact of its having been granted are to be publicly notified.

ART. 150. A patentee may establish any number of works, for the purpose of carrying out his invention, subject to the general laws of the Kingdom, without being tied down to the seat of his right of citizenship or domicile; and he may transfer the privilege conferred by the patent, during the time it is in force, to other persons, or he may take them into partnership. A patent right, if the patentee dies before its expiration, passes to his heirs for the remainder of its term.

(Articles 150 to 153, relating to the penalties for infringing a patent, were repealed by the subsequent law of 1842, a translation of which will be found in the Appendix.)

ART. 154. A patent granted for the improvement of an invention already patented is limited to the improvement itself, as manifested by the distinguishing characteristics pointed out in the specification, and it confers no right on the patentee to the other portions of the invention already patented. On the other hand, the original patentee is not allowed to avail himself of an improvement for which another person has obtained a patent.

ART. 155. A patent is to be considered as null and void—

1. If, before the receipt of the specification of the invention at the district office—

(a) Another person had applied for a patent for a similar invention in the form prescribed by Article 143; or

(b) If the thing patented had already been in use in the country, or in a foreign state, without the protection of a patent for invention or introduction, or had been so clearly described in some public print or work as to enable any person technically acquainted with the subject to apply it;

2. If the specification sent in (Article 143) was silent as to some integral part of the invention, upon which its complete application depended, or had incorrectly represented that which had been accepted as the reason and object of the patent;

3. If it should be proved by another Würtemberg subject that he was the inventor, and that the patentee had appropriated the invention by unfair behavior toward him.

The provision contained in 1 *b* has a limited application if the invention had already been used by another person before the patent was applied for, but had been kept secret. In that case, the patent granted subsequently remains valid, but its operation is not to extend to the persons by whom the thing patented was used before the patent was applied for.

ART. 156. A patentee who has concealed or who has incorrectly described an essential part of his invention, with a view to keeping his process a secret after the lapse of the term for which the patent was granted, renders himself liable to the penalty for fraud; and if the process in question was injurious to the public, to the additional penalty incurred thereby. (Section 123, ministerial order of March 20, 1851.) Complaints in regard to any curtailment or violation of the right conferred by a patent are to be addressed to the district police office; the latter, in cases where there is a question of confiscating counterfeited tools, and apparatus and articles produced by the use of such tools and apparatus or counterfeited manufactures, or where there is a question of the repayment of the value of such articles, has either to decide independently within the limits assigned to the higher officials by section 98 of the administration act, or is to refer the matter to the decision of the provincial government. (Section 124, ministerial order of March 20, 1851.)

The decision in regard to disputes arising out of the declaration of the nullity or extinction of a patent rests, in the first instance, with the ministry of the interior, which directs the grant of patents. Should a complaint of infringement of patent rights, when heard before a functionary subordinate to the ministry of the interior, be met by the objection that the patent is null and void, or has expired, the objection is to be referred to the ministry of the interior; in the meantime, however, unless other objections stand in the way, the necessary instructions must be issued by the authority in question for the protection of the patentee.

ART. 157. A patent for invention ceases—

1. When the period for which it was granted has expired;

2. When it is relinquished by the holder;

3. If the patentee has failed to put it in operation in Würtemberg for two years from the date of the grant; or if, after having put it in operation, he has ceased to work it for two years consecutively, without giving valid grounds of impediment in either case;

4. If the process for which the patent was granted, or the method applied for the purpose, is shown to be incompatible with the laws.

ART. 158. A patent for introduction becomes extinct—

1. For the same reasons as those for a patent for invention;

2. When the patent or one of the patents by which the invention was patented abroad at the time the home patent for introduction was granted has expired.

ART. 159. The invalidation as also the extinction of a patent, when the latter occurs before the expiration of the term for which the patent was granted, are to be publicly notified.

ART. 160. When a patent has expired, any Würtemberg subject has a right to examine the specification of it which was sent in. It is at the discretion of the government to publish it in print or not.

Law of June 29, 1842, relating to Patents for Invention and Introduction.

William, by the grace of God King of Würtemberg:

In pursuance of the reservation made by the contracting states in concluding the customs union treaties, to come to an understanding with a view to the removal as soon as possible of all impediments to commercial intercourse arising out of privileges conferred by patents for invention, as to certain general principles in regard to the issue of such patents, and in pursuance of the negotiations which have taken place on the subject between the states of the union, we hereby, after consulting our privy council, and with the consent of our faithful estates, order and enact as follows:

ARTICLE I. The grant of patents for invention and introduction of new manufactures, manufacturing mediums or processes, even under the existence of the preliminary conditions laid down in Articles 143 to 145 of the revised general industrial code (Revidirte Allgemeine Gewerbeordnung) of August 5, 1836, depends on the discretion of the government, to be exercised according to the special circumstances of each particular case.

ART. II. The provisions of Article 145, No. 3, and Article 155, No. 1 *b*, of the general industrial code in respect to Würtemberg, are to apply henceforth to the whole territory of the customs-union. In like manner, in applying the provisions of Article 147, No. 2 *b*, and Article 155, No. 3, of the general industrial code, the subjects of the other states composing the customs union are to enjoy the same consideration and treatment as Würtemberg subjects.

ART. III. A patent for introduction for an invention by the subject of a union state, which has already been patented by him in another union state, can be lawfully acquired only by the inventor in question or by his legal successor.

A patent obtained by another person in contravention of this stipulation is subject to a declaration of nullity. (Revised industrial code, Articles 155 to 159.)

ART. IV. A patentee has an exclusive right to produce the patented article during the duration of the patent, and, if the patent is granted for a new mode of manufacture or for a machine or manufacturing tool, an exclusive right to apply the patented medium or process of manufacture. Any one making use for purposes of trade of a patented process or medium of manufacture, without having acquired the right to do so from the patentee, incurs the penalty of forfeiture, for the benefit of the rightful party, of the tools or apparatus which he has imitated, and also of the articles produced by their application; and if the articles in question have already been disposed of, or have been worked up with other things, he is bound to repay the value of them to the patentee at their selling price.

These provisions do not extend to any person using a patented medium or process of manufacture in *bona fide* ignorance of a patent right having been granted to some one else; but the person so acting, on a complaint being lodged by the patentee, is not only prohibited during the period of the patent from the further use of the said medium or process, but also from selling such articles not actually disposed of as have been produced by the infringement of the patent, in order to escape the penalties imposed by the preceding paragraph of this article.

ART. V. Subject to the same distinction as that which is set forth in Article IV, any one producing a patented manufacture without the consent of the patentee is liable, on the complaint of the latter and for his benefit, to confiscation of the manufactured articles, and to be called upon to repay the equivalent of the value, at their selling price, of articles already sold or worked up with other manufactures; or he may be merely inhibited from their further production and sale.

ART. VI. A patentee has no right to proceed against any one merely dealing in articles produced by a patented invention, or importing them from abroad, or only using the patented invention for other than manufacturing and industrial purposes.

ART. VII. The foregoing Articles IV to VI take the place of Articles 151 to 153 of the revised general industrial code of 1836.

Patents granted previous to the promulgation of the present law are governed, during the period for which they were issued, by the provisions of the revised general industrial code, which retain their validity in this respect even when at variance with the present law.

Our minister of the interior is charged with the execution of the present law.

(Signed) WILLIAM.

COMMISSIONER'S DECISIONS.

HYATT AND FRENCH.—*Interference.*

[*Appeal from the decision of the Board of Examiners-in-Chief, in the matter of the application of Thaddeus Hyatt and the patent of James French, granted February 13, 1872.—Decided December 6, 1873.*]

In a controversy between two independent inventors, where it appeared that one was first to conceive an invention and construct a device embodying it, but rested for twelve years before attempting to use the invention or apply for a patent for it, and in the interim the other invented, perfected, patented, and largely introduced the invention: *Held*, that the latter was, in contemplation of law, the prior inventor.

An inventor, through want of diligence in the reduction of his invention to practice, may forfeit whatever right he may have thereto to another independent and more diligent inventor of the same thing.

The questions of abandonment and forfeiture, in an interference, are distinct questions; for abandonment of an invention operates in favor of the public, and forfeiture in favor of another inventor.

LEGGETT, *Commissioner:*

I have heretofore, on various occasions, after mature

consideration, fully expressed my views upon the questions presented in this case, particularly in the case of *Diston* vs. *Emerson*, (Commissioner's Decisions, 1871, p. 162,) which is precisely parallel in the principles involved. The decision of the Examiner of Interferences, which was complimentarily referred to and indorsed by the Board of Examiners-in-Chief, fully and correctly states the facts proved and the law applicable to them, and relieves me from the necessity of going over the same ground in writing an opinion. His decision is as follows:

The invention forming the subject of this controversy consists in providing a vault-light with an air-space between its upper and lower lenses, for the purpose of preventing the "sweating" of the inner side of the glass.

French's application was filed on August 5, 1871, and a patent was granted to him on February 13, 1872.

Hyatt's application was filed on February 19, 1873, one year and six days after the issue of French's patent.

The testimony in the case on behalf of the patentee consists of the deposition of French only, wherein he swears that he first conceived the idea of the disputed invention about one year before filing his application for patent, (July, 1870,) that he "first made a model in December, 1871;" that the first "work done" by him was in November, 1871, or near that time; that the use of the invention in Chicago, since the fire, has been "quite extensive;" that the French Vault-Light Manufacturing Company is now making and selling his invention under his patent involved in this controversy; that he has "spent his best energies" to introduce the invention, devoted all of his time, and invested all he is worth in it, and that the business has proved successful. I also find that he is an independent inventor.

The testimony in the case on behalf of Hyatt proves that he made Exhibit "No. 1" in January, 1861, (see depositions of Lobdell and Wilde,) and this is admitted on the part of French. Wilde swears that he put the glass in the Exhibit (No. 1) in the winter of 1860, or very early in the spring of 1861. (Ans. 4.)

The applicant, Hyatt, who was sworn on his own behalf, says that he went to Europe in 1861, because of ill health, and did not return to active business until the autumn of 1872; that the invention at issue was conceived by him and put in the shape illustrated in Exhibit "No. 1" before his leaving for Europe in 1861; that owing to his sickness and absence from home he has not been able to do anything toward putting the disputed invention in practical use, and that to his knowledge it never has been in use.

Exhibit "No. 1" perfectly illustrates the invention as it is claimed by Hyatt, but it differs in construction from the invention shown by French, in that the glass is set in a single frame of iron, while French employs a double iron frame.

The evidence, then, is that Hyatt was the first to conceive the invention and the first to embody it in a permanent condition in a model. All this he did twelve years before the filing of his application. In the mean time—viz., in July, 1870—the same invention was conceived by French, who diligently followed up the conception by the making of a model and the practical application of the invention to public use; and without delay he conferred upon the general public a knowledge of the invention through the medium of a patent.

If it be found in the present instance that Hyatt's invention was reduced to practice before the making and patenting of the invention by French, his right to receive a patent is good in law, for the proof in the case furnishes no evidence of abandonment on his part. If, on the other hand, it be found that Hyatt had not *reduced his invention to practice* prior to the time above named, then it will be necessary to inquire whether he has used reasonable diligence to that end. This question—that is, forfeiture—is entirely distinct from that of abandonment; for abandonment always operates in favor of the public, and it can only be adjudged against one who has perfected and reduced his invention to practice, whereas *forfeiture* takes place in regard to an invention which has not been carried to that state of perfection where the courts will hold that it has been *reduced to practice*, and it operates in favor of a third party. (*Jenkins* vs. *Barney & Berry*, O. G., vol. 3, p. 112.) An inventor, through want of diligence in the reduction of his invention to practice, may forfeit whatever right he may have thereto in favor of another independent and more diligent inventor of the same thing.

Now Hyatt made the model, Exhibit "No. 1," in January, 1861, and put it away in his closet, where it remained until produced in this case. It was never tested; never put to any use whatever. Under the authority of many decisions the making of this model must be held to have been a mere experiment, and therefore not such a reduction of the invention to practice as would defeat a patent granted to a subsequent meritorious inventor. In *Cahoon* vs. *Ring*, (1 Fish., p. 409,) Justice Clifford, in his charge to the jury, said: "Should you find that it (the machine) was made and completed prior to the Cahoon invention, and that it does embody the improvements in the Cahoon patent, * * * * you will then inquire whether it was in point of fact a machine completed and reduced to practice in contradistinction to an experimental machine, or a machine made by the supposed inventor, in the prosecution of experiments and inquiries; and that unless it appears to your satisfaction that such a machine was actually used as a seed-sower in sowing seed for agricultural purposes, you are warranted in presuming that it was a mere experiment, and if so, you are instructed that it would not invalidate the plaintiff's patent." In *Parker* vs. *Hulme*, (1 Fish., p. 53,) Judge Kane said: "It is not enough for the defendant to show that wheels like the patented ones were *made*, but that he must also show that they were *used* before the plaintiff's invention. This is the test of what is required to defeat the title of a patentee of an improved machine." (See, also, *Pfeffenhausen* vs. *N. Y. G. P. Comb Co.*, 2 Fish., p. 68; *Seymour & Morgan* vs. *Marsh*, O. G., vol. 2, p. 677; *Gaylor* vs. *Wilder*, 10 How., S. C. Rep., p. 477; *Johnson* vs. *Root*, 2 Fish., p. 207; *Ellithorpe* vs. *Robetson*, ib., p. 85; *Rich* vs. *Lippincott*, ib., p. 7.)

Upon the question of diligence, Hyatt has no standing whatever. He was negligent in regard to this invention to a degree which nothing but an utter incapacity to transact business or complete poverty can excuse. His sickness, which is the burden of his plea, did not prevent his attending to other business, nor did it interfere with his prosecuting to success a number of applications for patents. (See list of patents referred to in arguments of both parties.) Upon the evidence, therefore, it must be held that the reasonable diligence which the law demands in such cases has not been exercised on the part of Hyatt. (*Ball* vs. *Fletcher*, C. D., 1870, p. 97; *Wheeler* vs. *Peters*, ib., p. 141; *McClure* vs. *Miller and Mason*, ib., p. 122; *Duchemin* vs. *Richardson & Stein*, ib., p. 31; *Hussey* vs. *Willard*, C. D., 1871, p. 297; *Diston* vs. *Emerson*, ib., p. 162.)

Priority of invention in contemplation of law is accordingly adjudged to be with the said James C. French.

J. E. M. BOWEN,
Acting Examiner of Interferences.

JULY 22, 1872.

The decision of the Board of Examiners-in-Chief is affirmed, and priority awarded to French.

DANIEL F. HAASZ.—*Appeal.*

[*Appeal from the decision of the Primary Examiner in the matter of the application of Daniel F. Haasz, for* PORTABLE FARE-BOXES.—*Decided December 8, 1873.*]

Practice as to claims—

A claim in which the words "or their equivalents" were used held to be ambiguous, and disallowed.

Whenever the words "equivalent" or "equivalents" occur in a claim, in such a connection as to have an equivocal signification, their employment, in that connection, must be inhibited.

The use of any particular word or phrase is not to be absolutely prescribed or proscribed; but no ambiguous or useless word or phrase should be allowed in a claim. Judicious care must be exercised in each case, to the end that claims shall clearly, definitely, and correctly comprehend the invention, and nothing more.

LEGGETT, *Commissioner:*

This invention consists of certain improvements in fare-boxes for the reception of coin or metallic passenger-checks, on city railways, and its object is to prevent the abstraction of the checks or coin from the box. Two sets of converging elastic spring-rods are placed, for this purpose, one above the other, in the chute leading from the bottom of the hopper to the large check compartment or depositary in the lower portion of the box. Applicant illustrates these spring-rods as composed of metal and of bristles, and says—

I do not desire to confine myself to the use of metal spring-rods arranged in precisely the manner above described, as rods formed of bristles or of other suitable materials having an inherent spring may be substituted for the rods, as illustrated in the sectional views, Figs. 5 and 6 of the drawings.

He claims—

A fare-box in which a channel for the downward passage of a coin or check is bounded by converging rows of independent spring-rods or their equivalents, substantially as and for the purpose herein set forth.

The Examiner objects to the words "or their equivalents" in the claim, upon which objection this appeal is taken. The grounds of objection stated are, first, that these words deprive the claim of the necessary accuracy and precision; second, that they are superfluous; and, third, that it is for the courts to determine what constitute equivalents.

The third objection is not well taken. The determination of what are and what are not mechanical equivalents constitutes the major part of the duties of the examining corps. It is only after patents are granted that the question belongs to the courts. The other objections are those usually urged against the use of these words in claims.

I know of no rule or reason for prescribing or proscribing the use of any particular word or phrase in connection with a specification or claim. Anything of the sort would necessarily be arbitrary and unreasonable. All the words of our language are, of course, as free to the intelligent and appropriate use of inventors in their specifications and claims as to anybody else; but there are some words and phrases which are capable of being used equivocally, and perhaps the words *equivalent* and *equivalents* are the most conspicuous examples. Whenever they occur in such a connection as to have an equivocal signification, their employment in that connection must be inhibited. This is as far as a rule of practice in the matter can go. Under this rule judicious care must be exercised in the consideration of each particular case, where these words occur, to the end that the claims shall clearly, definitely, and correctly comprehend the alleged subject-matter of invention and nothing more. No ambiguous or useless word or phrase ought ever to be allowed in a claim. It is well known to those versed in patent law, that equivalents are comprehended in every claim whether specified or not, and that the use of the word in a claim cannot enlarge its legal scope. Wherever its use would merely serve to convey a magnified idea of the scope of the patent to the uninformed, it surely ought not to be allowed. I think its employment in a claim will seldom be found to be other than useless or mischievous, and it should, therefore, always be closely scrutinized by Examiners whenever it occurs. The rule excluding new matter in reissues especially emphasizes this course. Yet the Office would not be justified in holding the word to be of itself so inherently vicious as to be, under all circumstances, absolutely precluded.

In this case the applicant shows and describes two kinds of spring-rods, or, rather, spring-rods made of two different materials, one of metal and the other of bristles, which are probably equivalents. He argues that the words, "or their equivalents," in the claim, refer to these interchangeable spring-rods, or materials for spring-rods.

I think it doubtful, however, whether these words, as collocated in the claim, would not be more likely to be understood to refer to the "converging *rows*" of spring-rods than to the individual spring-rods. If they are merely intended to refer to the latter, such might be made to appear unmistakably by inserting words which would limit the "equivalents" to those described in the specification. Then the full benefit of all that the applicant has described as equivalents in his specification will be definitely and expressly secured to him in his claim. The applicant would probably prefer, however, to erase the words than to thus limit them.

As the claim now stands it is ambiguous, and the decision of the Examiner is, therefore, sustained.

HENRY W. GOULD.—*Appeal.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the application of Henry W. Gould, for Letters Patent for an* IMPROVED MODE OF ADVERTISING.—*Decided December 9, 1873.*]

The mere attachment of an advertisement to an ordinary anchored balloon, without specially adapting the balloon to the purpose of displaying advertisements, held not to constitute a patentable invention.

It is a common right to place an advertisement in any eligible position for displaying it where not legally prohibited, and there is no more ground for patent on account of the selection of an anchored balloon than on account of the selection of any other conspicuous object.

The idea of attaching an advertisement to a balloon, instead of some other well-known object, cannot be patented.

THACHER, *Acting Commissioner:*

Applicant claims—

An advertising apparatus, consisting of a balloon, A, one or more supporting ropes, B, and hand-bills or placards D, and either with or without a supply-pipe, C, the whole arranged and operated substantially as described.

The employment of more than one "supporting rope" and the presence of the supply-pipe being alternative in the claim, the essential elements of the advertising apparatus claimed are the balloon, anchor-rope, and advertising placard.

Much has been said in the arguments of counsel filed in this case, in relation to the adaptation of the means employed to the end sought. This may all be laid aside, for the specification describes no peculiarity in the construction of the balloon, the anchorage to the earth, or the advertising sign. A balloon held at a certain height above the earth by an anchor-rope, has been known and used for various purposes for a great length of time. Applicant's so-called invention, then, as now claimed, consists simply in the attachment of an advertisement to an object already in use, and without changes for adapting it to the special purpose. This does not present patentable novelty. Whatever may have been done in adapting the balloon to the purposes of advertising may present patentable invention; and, as the Examiner states, has already been recognized as such by the Office.

The fact that an advertisement has never been attached to a balloon before is not material to the issue. It is a common right to put an advertisement anywhere,

unless prevented by legal prohibition. There is no more ground for the grant of the patent sought by this applicant than to one who should for the first time attach an advertisement to a carriage, train of cars, lofty building or flag-staff, suspend it over a street, paint it upon a cliff, set it on a high hill, or put it in a thousand other places, which have suggested themselves to enterprising business men, and have been found by them ready for the purpose. There is nothing in this case, as presented, but the *idea* of attaching an advertisement to a balloon instead of some other well-known object. A patent cannot be allowed for this idea merely.

The decision of the Examiners-in Chief is affirmed.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—DISTRICT OF MASSACHUSETTS.

BENJAMIN J. GREELEY, COMPLAINANT IN EQUITY.

[*In the matter of the application of Benjamin J. Greeley, for patent for* IMPROVEMENT IN SUSPENDER-STRAPS.—*Decided November* 14, 1873.]

In two devices—each being a combined button-hole and link—where the same elements, in the same relations, enter into the same combination, and operate in the same way separately, and as a combined device, the devices are the same.

Where the opening for receiving the button in each device was longer than the diameter of the button, the fact that in one the opening was elongated in a direction at right angles with the link, and in the other in a direction parallel with the link, was held to be a mere structural change.

Structural changes of form and proportion, although they improve the operation and produce a much better result, yet one of the *same kind*, are only different and better forms of embodying the same idea, and illustrate the difference between mechanical skill and inventive genius.

[*J. E. Maynadier*, for complainant.

Marcus S. Hopkins, for Commissioner of Patents.]

SHEPLEY, *J.*:

This is an application for a patent for an alleged improvement in suspender-straps. The application was filed in the Patent Office September 13, 1869, with two claims, which were rejected. On December 16 they were withdrawn and two others presented in lieu of them. These were rejected and withdrawn, and on the 23d of February, 1870, the present claims were presented. These claims were rejected by the Examiner February 28, and, on appeal, by the Board of Examiners April 27, and by the Commissioner on appeal from the Board, September 17, 1870, and by the Supreme Court of the District of Columbia, on appeal from the Commissioner May 3, 1871.

The bill in equity in this case is filed under the provisions of the fifty-second section of the act of July 8, 1870, and is virtually an appeal from the decree of the Supreme Court of the District of Columbia rejecting the application for the patent.

The applicant claims, in the second and most material and important claim to be considered in his application, "the metallic button hole and link combined above described, consisting of a single piece of metal shaped as shown, so that the button used may be of a diameter greater than the width of the device." The first claim, which is for a combination of the combined button-hole and link, with a piece of webbing with a button-hole at its free end and a slide, must stand or fall with the second claim. The question presented is whether the references cited in the record anticipate the complainant's alleged invention of the metallic button-hole and link combined, as described and claimed in the second claim.

The English patent of R. A. Brooman, granted in 1861, and cited in the references on the record, is for a combined link and button-hole. It has, first, a link for the purpose of attachment to the web; second, an enlarged body of the device to admit the insertion of the button; third, a loop at the bottom for retaining the button. This loop at the bottom also performs the function of admitting the button to pass more easily through the enlarged opening made to receive the button by receiving the shank of the button as the button is being passed through the opening.

The device of Greeley has, first, a link for attachment to the web; second, an enlarged body of the device for the insertion of the button; third, the loop at the bottom for retaining the button. Each one of these stands in the same relation to the others and performs the same function in Greeley's as in Brooman's device. The same elements enter in the same relations into the same combination, and they operate in the same way, separately, and as a combined device. In Greeley's device the opening to receive the button has its greatest diameter in a direction at right angles with the link, while in Brooman's the longest diameter is in a direction parallel with the link, so as to admit the button in a direction at right angles with the direction in which it is admitted in Brooman's. To accommodate this change of direction loops are also made on each side of the opening as well as on the bottom, to receive the shank of the button as it is being passed through the metallic loop. This adds much to the convenience of the device, and works better in use, and receives a button sidewise.

It is contended that it is impossible to use a button with Brooman's device whose diameter is greater than the width of the device, and no change in the relative proportion of the parts will make it possible. "Width" is used by the claimant to express the shorter diameter of the device as a whole, and not the shorter diameter of the operative part. It is easy to see that Brooman's device may be elongated so as to receive sidewise a button of greater diameter than the width of Brooman's device. Neither of them will admit a button of greater diameter than the length of the opening. In its relation to the button the parts of the device intended to receive the button are to be considered, and in each of them the opening made to admit the button is longer than the diameter of the button in the line of the plane through which the button enters, and less than the diameter of the button measuring at right angles with that line. The differences between the two devices are merely structural changes. Such structural changes of form and proportion, although they improve the operation without changing the mode of operation, and produce a much better result, but one of the same kind, are only different and better forms of embodying the same idea, and illustrate the difference between mechanical skill and inventive genius.

As compared with Brooman's invention, the complainant's device as a combined device is not a novel one, but possesses the same elements operating in the same way to produce the same result, and is not patentable.

Bill dismissed.

APPLICATIONS FOR EXTENSION.

Applications having been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

26,785.—Waste-Cocks of Hydrants.—Granted to GEORGE W. ROBERTSON, January 10, 1860. Application filed October 3, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,808.—Manufacture of Boots and Shoes.—Granted to FRANCIS D. BALLOU, January 10, 1860, and reissued April 15, 1862. Application filed October 4, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,822.—Tool for Cutting Round Tenons.—Granted to LEVI A. DOLE, January 10, 1860. Application filed September 30, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,860.—Machines for the Manufacture of Tinware, granted to SAMUEL J. OLMSTED, January 17, 1860. Application filed October 16, 1873. Testimony closes December 16, 1873. Hearing December 31, 1873.

26,891.—Catches for Spectacle-Cases.—Granted to GEORGE N. CUMMINGS, January 24, 1860. Application filed September 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,902.—Planing-Machines.—Granted to SOLOMON S. GRAY, January 24, 1860. Application filed October 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,906.—Stitches.—Granted to ALBERT F. JOHNSON, January 24, 1860. Application filed October 25, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,914.—Clothes-Wringers.—Granted to ROBERT O. MELDRUM and AMOS B. PAXSON, January 24, 1860. Application filed October 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,919.—Repeating Fire-Arms.—Granted to WILLIAM H. MORRIS and CHARLES L. BROWN, January 24, 1860, and reissued August 1, 1871. Application filed October 23, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,942.—Seats and Couches for Railroad-Cars.—Granted to THEODORE T. WOODRUFF, January 24, 1860. Application filed October 25, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,948.—Sewing-Machines.—Granted to ALBERT F. JOHNSON, January 24, 1860. Application filed October 24, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,952.—Lamps, granted to GEORGE NELSON, January 24, 1860. Application filed October 18, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

27,008.—Machines for Attaching and Finishing Boot-Heels.—Granted to HERMAN SALOSHINSKY, January 31, 1860, and reissued March 26, 1867. Application filed October 28, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,020.—Variable Exhaust-Pipe for Steam-Engines.—Granted to GEORGE EDWARDS, January 31, 1860. Application filed November 1, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,023.—Calendar-Clocks.—Granted to EUGENE M. MIX and JAMES E. MIX, January 31, 1860. Application filed October 31, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,034.—Harvesters.—Granted to JOHN BUTTER, February 7, 1860; and reissued June 13, 1871. Application filed November 4, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,043.—Lock for Umbrella-Stands.—Granted to ALFRED M. FOOTE, February 7, 1860. Application filed November 8, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,065.—Coffee-Mills.—Granted to JOHN and EDMUND PARKER, February 7, 1860. Application filed October 9, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,094.—Machine for Making Cartridge-Cases.—Granted to ETHAN ALLEN, February 14, 1860, and reissued May 9, 1865, in two divisions, numbered, respectively, 1,948 and 1,949. Application filed November 11, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,135.—Sugar-Cutters.—Granted to CHARLES KINDLER and WILHELM ROSEBROCK, February 14, 1860. Application filed November 13, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,139.—Hanging Rudders.—Granted to JOSEPH P. MANTON and HENRY A. BILLINGS, February 14, 1860. Application filed November 10, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,179.—Marking-Gages for Sewing-Machines.—Granted to CALVIN D. WHEELER, February 14, 1860. Application filed November 14, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,185.—Soldering-Irons.—Granted to ARNER BURBANK, February 4, 1860. Application filed November 8, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,241.—Photographic Cameras.—Granted to AUGUST SEMMENDINGER, February 21, 1860. Application filed November 20, 1873. Testimony closes January 20, 1874. Hearing February 4, 1874.

27,291.—Seed-Planters.—Granted to JOHN S. HUGGINS, February 28, 1860. Application filed November 24, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,297.—Couches for Railroad-Cars.—Granted to EDWARD C. KNIGHT, February 28, 1860. Application filed November 29, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,303.—Fastening Saw-Handles.—Granted to JACOB NEIMEYER, February 28, 1860. Application filed November 26, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,319.—Machine for Bending Sheet Metal.—Granted to ORSON W. STOW, February 28, 1860; and reissued August 4, 1868. Application filed October 20, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,337.—Table-Cutlery.—Granted to JOSEPH W. GARDNER, March 6, 1860. Application filed December 3, 1873. Testimony closes February 3, 1874. Hearing February 18, 1874.

27,392.—Machine for Folding and Pasting Paper.—Granted to GEORGE K. SNOW, March 6, 1860. Application filed December 3, 1873. Testimony closes February 3, 1874. Hearing February 18, 1874.

27,403.—Steam and Fire Regulators.—Granted to JOSEPH WOODRUFF, March 6, 1860. Application filed December 5, 1873. Testimony closes February 3, 1874. Hearing February 18, 1874.

27,406.—Cultivators.—Granted to ROBERT CRAIG, March 6, 1860. Application filed November 22, 1873. Testimony closes February 3, 1874. Hearing February 18, 1874.

27,438.—Blackwashing-Molds for Casting.—Granted to WILLIAM FERGUSON and DAVID FERGUSON, March 13, 1860. Application filed December 10, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

27,447.—Chain for Timber-Bending Machines.—Granted to LEVI HEYWOOD, March 13, 1860. Application filed December 13, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

27,456.—Machines for Covering the Springs of Skeleton Skirts.—Granted to JOHN T. LOFT, March 13, 1860. Application filed October 6, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

27,478.—Turning-Lathes.—Granted to WILLIAM SELLERS, March 13, 1860. Application filed December 13, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

27,485.—Lanterns.—Granted to AUGUSTUS TUPTS, March 13, 1860. Application filed December 19, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

27,545.—Fitting Sinks.—Granted to JAMES INGRAM, March 20, 1860. Application filed December 15, 1873. Testimony closes February 17, 1874. Hearing March 4, 1874.

27,594.—Sewing-Machines.—Granted to L. W. LANGDON, March 20, 1860. Application filed December 13, 1873. Testimony closes February 17, 1874. Hearing March 4, 1874.

27,656.—Horseshoe-Nail Machines.—Granted to WILLIAM TALLMAN, March 27, 1860. Application filed December 15, 1873. Testimony closes February 24, 1874. Hearing March 11, 1874.

30,467.—Apparatus for Singeing Pigs.—Granted to ABRAHAM and EDWARD M. DENNY, October 23, 1860. Patented in England February 2, 1860. Application filed October 17, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

31,262.—Pare-Boxes.—Granted to JOHN B. SLAWSON, January 29, 1861. Patented in England January 16, 1860. Application filed October 7, 1873. Testimony closes December 16, 1873. Hearing December 31, 1873.

EXTENSIONS GRANTED.

26,408.—Improvement in Composition for Kindling Fires, granted to ELIZABETH BELLINGER, December 13, 1859; reissued August 7, 1866, numbered 2,366.

Claim.—A self-lighting fire-kindler, made substantially as herein described.

26,410.—Improvement in Seed-Planters, granted to WILLIAM BLESSING, December 13, 1859.

Claim.—The arrangement of the top portion of the distributer, made with a semi lunar opening, and the recess under the covered portion of the said top, when the periphery of the said top is made with the chaff openings H, on either side of the reciprocating seed-bar, so that the said bar, by its reciprocating action, shall work out the chaff through the passages H H on either side of the seed-bar, and thus prevent choking the distributer.

26,434.—Improvement in Dispensing with Switches on Railroads, granted to WILLIAM WHARTON, Jr., Philadelphia, Pa., December 13, 1859; reissued April 3, 1860, numbered 942.

Claim.—The employment, in connection with the sidings or turn-outs on railways, of supplementary inclined and elevated rails, in combination with car-wheels so constructed as regards the said inclined rails, which are so arranged as regards the rails of the siding or turn-out, that the wheels may be elevated above and free from the control of the rails of one track and be placed under the control of those of another track, as herein set forth.

DISCLAIMERS FILED.

28,244.—GEORGE B. ARNOLD.—Ruffles, granted May 8, 1860.

The "Magic Ruffle Company" disclaims:

"So much thereof as allows the claim to include other than a band-ruffle combining the following characteristics and limitations: First, when made separately, ready to be attached to garments; second, with stitches formed by a series of loops passed through the fabric and secured; and, third, with a single series of stitches, which perform the double function of confining the gathers and securing the gathered fabric to the binding."

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date December 9, 1873.]

7,018.—Butt-Hinge.—WILLIAM GORMAN, New Britain, Conn., assignor to THE RUSSELL AND ERWIN MANUFACTURING COMPANY, same place.—Case F. Application filed November 15, 1873. Term of patent 14 years.

7,019.—Door-Knob Rose.—WILLIAM GORMAN, New Britain, Conn., assignor to THE RUSSELL AND ERWIN MANUFACTURING COMPANY, same place.—Case G. Application filed November 15, 1873. Term of patent 14 years.

7,039.—Carpet.—ELMER J. NEY, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed November 29, 1873. Term of patent 3½ years.

7,040.—Carpet.—ELMER J. NEY, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed November 29, 1873. Term of patent 3½ years.

7,041.—Carpet.—ELMER J. NEY, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed November 29, 1873. Term of patent 3½ years.

7,042.—Carpet.—ELMER J. NEY, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed November 29, 1873. Term of patent 3½ years.

7,043.—Carpet.—ELMER J. NEY, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed November 29, 1873. Term of patent 3½ years.

7,044.—Carpet.—HENRY NORDMANN, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed September 26, 1873. Term of patent 3½ years.

7,045.—Carpets.—HENRY NORDMANN, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed September 26, 1873. Term of patent 3½ years.

7,046.—Badge.—JOSEPH SEYMOUR, Syracuse, N. Y. Application filed February 10, 1873. Term of patent 7 years.

7,047.—Corners of Glass Show-Cases.—THOMAS VAUGHAN, Boston, Mass. Application filed October 31, 1873. Term of patent 7 years.

7,048.—Cooking-Stove.—NICHOLAS S. VEDDER and FRANCIS RITCHIE, Troy, N. Y., assignors to NICHOLAS S. VEDDER, same place. Application filed September 12, 1873. Term of patent 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date December 9, 1873.]

1,565.—Soap.—R. M. BISHOP & Co., Cincinnati, Ohio. Application filed August 26, 1872.

"the figure of a tiger."

1,566.—Cured Meats.—WILLIAM H. DAVIS AND Co., Cincinnati, Ohio. Application filed November 7, 1873.

"'Triangle Brand.'"

1,567.—Steel Corset-Springs.—FRANCES LEE EGBERT, Waterbury, Conn., and New York, N. Y. Application filed November 26, 1873.

"'Can't-break-ems.'"

1,568.—Bourbon Whisky.—E. A. FARGO & Co., San Francisco, Cal. Application filed November 25, 1873.

"'Spirit of '76, E. A. F. & Co., old Bourbon Whiskey;' man, gun, horse, and trees."

1,569.—Ammoniated Superphosphate Fertilizer.—J. M. RHODES & Co., Baltimore, Md. Application filed November 24, 1873.

"Three circles containing initials, and with interlocking circumferences."

1,570.—Cotton-Gin.—THE BROWN COTTON-GIN COMPANY, New London, Conn. Application filed November 22, 1872.

"'The Brown Gin.'"

1,571.—Carpets.—JOHN DORNAN, Philadelphia, Pa. Application filed October 30, 1873.

"'Monitor.'"

1,572.—Whisky.—EPHRAIM HOWE, New York, N. Y. Application filed September 8, 1873.

"'New Time.'"

1,573.—Oysters.—O. W. MILLER & Co., Baltimore, Md. Application filed December 4, 1873.

"an acute-angled triangle, in which are the firm-name, the business, and the place of business."

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date December 9, 1873.]

ORIGINAL PATENTS.

145,268.—Hand-Truck.—NATHAN ADAMS, Altoona, Pa. Application filed March 25, 1873.

The frame of the truck has a shoulder against which the burden rests. The handle is slotted, and pins are so arranged as to lock the notched lever, which serves to secure the burden.

Claim.—1. The lever C, having grappling-hooks *b b* at its forward end, and a series of hooks, *c*, in its lower edge, in combination with the pins *a* of the slotted tongue B, substantially in the manner and for the purpose above set forth.

2. The truck-frame A, having the shoulders *a a* at the forward end for preventing the burden from coming against the wheels D D, substantially as described.

145,269.—Designer's Paper.—ABRAHAM AKERBOYD, Manchester, N. H. Application filed July 21, 1873.

The usual paper used by designers for textile fabrics is printed in checker-board pattern, (as to the stitch-squares,) to aid the eye in counting the same.

Claim.—The design-paper herein described, having every other space printed or dotted any light or dark shade, as and for the purposes specified.

145,270.—Harness-Buckle.—JOHN ALLEN, Squaw Grove, Ill. Application filed February 1, 1873.

The plate or frame has loops on two opposite sides, and studs or tongues on two adjoining sides. The straps are secured by means of a serrated wedge passed under the loop.

Claim.—The plate C, provided with pins *e w* and loops *f f*, in combination with the key-wedge O, having serrated or toothed side flanges, substantially as and for the purposes herein set forth.

145,271.—Game-Board.—ALBERT F. R. ARNDT, Detroit, Mich., assignor to THORNDIKE NOURSE and NOAH D. LAPHAM, same place. Application filed July 25, 1873.

The ball at the head of the inclined table-bed is thrown up by sudden pressure of the button at the foot, and finds its way among the fixed and loose pins and pockets, with such numerical result as may be, to the pools or bins below.

Claim.—A game-table having the inclined bed B, lever C, studs *b*, pins *d*, sockets *e*, stalls *i*, men D, ball F, and flange E, when said parts are constructed and arranged substantially as herein described and shown.

145,272.—Churn-Dasher.—GEORGE W. BARKER, St. John's, Mich. Application filed July 31, 1873.

A conical dasher forming a flaring expansion of a hollow rod, with a close diaphragm near its base, the part below the diaphragm being perforated for the passage of the cream, the rod and hollow cone to contain a cooling or warming fluid.

Claim.—A churn-dasher consisting of the hollow tube B, the conical base C with perforated rim D and diaphragm E, all constructed as shown and described.

145,273.—Cotton-Bale Tie.—GEORGE N. BEARD, St. Louis, Mo. Application filed November 7, 1873.

Claim.—The bale tie or fastening having a stiff back, A, horn B, ear or ears C D, and band ends E and *f*, the former end lying directly beneath the whole width of the latter, and holding it in place without aid from the cotton.

145,274.—Metallic Foil for Dental Purposes.—CHARLES E. BLAKE, San Francisco, Cal. Application filed November 10, 1873.

Claim.—As a new article of manufacture, platinum foil or leaf coated with gold, either upon one or both sides, substantially as and for the purpose above described.

145,275.—Dental Filling.—CHARLES E. BLAKE, San Francisco, Cal. Application filed October 4, 1873.

Claim.—A filling for teeth consisting of the usual base covered with a stratum of platinum or other metal approximating to the color of the enamel of the teeth, as set forth.

145,276.—Cooking-Stove.—LEWIS E. CLOW, St. Louis, Mo. Application filed May 29, 1873.

There is a dead-air space between the oven and the fire-pot section. A continuous flue passes around the front of the stove and on three sides of the oven, terminating in an extension-flue wide as the stove and contracted from front to rear, to furnish room for pot-holes over the oven. A two-way damper admits the products of combustion directly to the exit-flue, or compels them to pass around through the circuitous flue.

Claim.—1. The stove described, having the central portion A, with fire-box B and flue *a*, extending about the front and bottom of the part A, and also bottom, rear, side, and top of oven E, the two-way damper a^2, and the extension-flue F, constructed and arranged as described, for the purpose set forth.

2. The flue F, extending above the top plate of part E, and constructed with a contracted portion below, for the purpose of leaving space for the pot holes, and a gradually-expanding top above, to give increased surface for the radiation of heat, in combination with the flues *a* a^2 and two-way damper a^2, as described.

145,277.—Artificial Stone.—THOMAS CHRIMES, Jackson, Mich. Application filed November 6, 1873.

Claim.—The composition for artificial stone herein described, consisting of artificial pozzuolana, lime, and iron, combined with cement and sand by means of potash in solution, substantially as set forth.

145,278.—Ingot-Mold.—NEY CHURCHMAN, Pioche, Nev. Application filed August 16, 1873.

The bottom of the mold is slotted to receive removable wedge-shaped pieces, which are loosened when the metal is poured, to allow the bottom to expand without bulging.

Claim.—An ingot-mold having its bottom provided with slots or openings *b b*, in combination with corresponding wedges or keys *c*, substantially as and for the purpose above described.

145,279.—Smoke-Stack.—THEODORE F. CONKLIN, Fond du Lac, Wis. Application filed September 30, 1873.

Fan-beaters, with feathers running diagonally across their wind-surfaces, are attached by horizontal arms to an upright shaft, and a screw-wheel is arranged at the lower portion of said shaft, operating, by the force of the exhaust-steam, to cause the rapid revolution of the fan-beaters in the stationary rimmed cap of the smoke-stack, for arresting and pulverizing the sparks.

Claim.—1. The combination of the fan-beaters A A, the cap B, rim *b*, and screw-wheel C, attached, as stated, in and to locomotive and other smoke-stacks, substantially as and for the purpose hereinbefore set forth.

2. The combination of the fan-beaters A A and feathers *a a*, substantially as and for the purpose hereinbefore set forth.

145,280.—Carriage-Axle.—SIMEON S. COLE, Woonsocket, R. I. Application filed June 20, 1873.

Claim.—1. The axle-box having longitudinal ribs *k k*, provided with screws *l l* at their outer ends, and communicating with the axle through orifices *m*, filled with porous plugs *m'*, substantially as described, for the purpose specified.

2. The axle *a*, having the collar *h*, spiral groove *i*, and internal channel *k*, communicating with the exterior of the axle through porous plugs *e* in the orifice *e'*, substantially as described, for the purpose specified.

145,281.—Steam and Air Engine.—FRANK J. CROUCH, San José, Cal. Application filed September 27, 1873.

Claim.—1. The method herein described for working steam, consisting in introducing steam from the boiler into the steam chest and cylinder and superheating it at the moment it is introduced under the piston, as set forth.

2. The boiler B, in combination with the furnace A and open-topped cylinders D arranged to set into the fire-box and having suitable steam-connections, as set forth, and for the purpose described.

3. The cylinders C C, either with or without the air-valves *p*, in combination with their double cup-shaped pistons D D, pitmen F, and crank-shaft *f*, substantially as and for the purpose above described.

145,282.—Machine for Making Weaver's Harness.—JOHN H. CROWELL, Providence, R. I., assignor to THE KENDRICK LOOM-HARNESS COMPANY, same place. Application filed July 2, 1873.

In combination with traveling twine-carrying spools for forming the heddles, independent sets of traveling spools, together with vibrating needles, are used for attaching the heddles to the side bands. To form and preserve the loose, two arms, situated in the central vertical plane of the machine, are used in combination with the heddle-forming spools, the arm forming the loose reciprocating, the other arm stationary. To prevent the contraction of the heddle-eye on its discharge from the forming-fingers, a gage-rod is used, having an intermittent vertical movement, its flat top, around which the eye is formed, determining the length of the eye. The gage-rod has a slot for receiving the discharger which removes the knots from the forming-fingers.

Claim.—1. The combination and arrangement of the twine-carrying spools A^5 A^7, for forming the heddles, traveling eccentrically in paths, as described, with the continuously-revolving spools A^5 A^6 and the reciprocating needles c^1 c^2, for attaching the heddles to the side bands, substantially as herein set forth.

2. In combination with the heddle-forming spools A^5 A^7, the vibrating arm b^3, for selecting the loose of the harness during the formation of the heddles, and the stationary arm b^5, for preserving, with the rod b^6, the loose after it has been selected, substantially as described.

3. In combination with fingers w^1 w^2, or their equivalents, on which the knots of the heddle-eyes are formed, gage-bar *o*, for limiting the minimum size of the eyes, substantially as described.

4. In combination with the heddle-forming spools and devices w^2 w^3, for carrying out the twines to the side bands, the gage-rod *o*, having a vertically-reciprocating movement for raising each eye, after it has been formed, above the plane in which it was formed, to give room for the formation of the next, substantially as described.

5. The gage-rod *o*, provided with an open slot to give admission to the discharger for discharging the knots of the eyes from the fingers whereon they are formed, substantially as described.

145,283.—Wire Stand or Holder.—GEORGE D. DUDLEY, Lowell, Mass., assignor to EDWARD P. WOODS, DANIEL SHERWOOD, and C. H. LATHAM, same place. Application filed October 23, 1873.

The stand is formed of twisted wire, with a central socket in which revolves the stem or shaft of a basket made of the same material.

Claim.—1. The wire sleeve-bearing A, formed of the wires which form the braces B or legs C', constructed substantially in the manner described and specified.

2. The combination, with the shaft E, of the basket or receptacle I, substantially as described.

3. The combination, with a supporting-stand, as described, of the shaft-furnished basket E G, constructed substantially in the manner described and specified.

4. As a new article of manufacture, a wire stand or holder made up of a receiving basket, G, and shaft E, and a sleeve, A, and legs C', substantially in the manner described.

145,284.—Wire Bottle-Stand.—GEORGE D. DUDLEY, Lowell, Mass., assignor to EDWARD P. WOODS, DANIEL SHERWOOD, and C. H. LATHAM, same place. Application filed October 23, 1873.

The stand is made of twisted wire, with legs contracted at the upper end, forming a socket for holding the shaft of a horizontal wheel having hangers for the reception of bottles.

Claim.—1. The revolving wire holder, made up of the wheel A, shaft C, and pendent receivers *e f*, constructed substantially in the manner described.

2. In combination with the revolving holder, the base-stand, made up of the sleeve D and legs E, substantially in the manner described.

145,285.—Wire.—GEORGE D. DUDLEY, Lowell, Mass., assignor to EDWD. P. WOODS, DANL. SHERWOOD, and CYRUS H. LATHAM, same place. Application filed January 6, 1873.

Claim.—The wire A, having the longitudinal grooves in its faces, as herein described, as a new article of manufacture.

145,286.—Handle for Sheet-Metal Ware.—JAMES FALLOWS, Philadelphia, Pa., assignor to C. B. PORTER & CO., same place. Application filed August 11, 1873.

Claim.—The process of producing sheet-metal handles by fitting together two blanks of sheet metal, A and B, while in the straight form, as shown in Fig. 3, then filling with melted tin, and, after cooling, bending the same into the required form of handle, and, finally, immersing the said solid handle in a bath of melted tin to remelt the core, and thus permit of the same being run out, leaving the joints of the two plates A and B soldered together, substantially as described.

145,287.—Sewing-Machine.—JOHN FANNING and EDWARD NUGENT, Brooklyn, N. Y. Application filed November 1, 1873.

The looper or under needle is actuated by an eccentric, and its forward end is guided in a block, which is free to oscillate as the looper-bar is moved sidewise and longitudinally, and this block is also adjustable to insure the correct position of the looping-needle.

Claim.—The oscillating adjustable guide H, constructed as described, in combination with the eccentric K, bar G, and needle E, operating in connection with an eye-pointed perforating-needle, as and for the purpose described.

145,288.—Filter for Wine.—CHARLES W. FARCIOT, Kelley's Island, Ohio. Application filed July 14, 1873.

The false bottom is provided with an opening, closed by a sliding door, to give easy access to the true bottom of the filter for cleaning it.

Claim.—The false bottom C, having the sliding door C^1, covering-piece C^2, recess *a*, opening *b*, and grooves *c*, arranged substantially as and for the purpose set forth.

145,289.—Sash-Balance.—ROBERT FARIES, Decatur, Ill. Case B. Application filed April 19, 1873.

A volute spring, a fusee, and a cord, of a swinging pulley in such a manner that the vibration of the pulley enables the cord to run properly on the pulley, and wind correctly on the fusee.

Claim.—The combination, with the volute spring I, fusee C, and cord F, of the swinging pulley E, substantially as described and shown, for the purpose specified.

145,290.—Cigar-Box.—HENRY FOWLER, Detroit, Mich. Application filed January 21, 1873.

A rabbet at the top receives the ends of the cover and prevents end-thrusts, a strip on the under side of the cover, near the front, preventing side-thrusts.

Claim.—A cigar-box having its front, bottom, and back formed of a single piece of bent card-board, the same being secured to end pieces of wood, rabbeted as described, and having a card-board cover provided with a strip, G, as and for the purpose set forth.

145,291.—Wheel for Vehicles.—DEXTER B. FRENCH, Grafton, Vt. Application filed April 11, 1873.

Claim.—The rings B B', right angled in cross-section, the hub A having wooden bearings *c*, conical on their plane bearing-surfaces, with spaces A A between them, and the spoke-mortises *b*, and the bolts *c*, all combined substantially as set forth.

145,292.—Machine for Punching, Splitting, and Creasing Bridles.—JOSIAH B. GATHRIGHT, Louisville, Ky. Application filed March 5, 1873.

Claim.—1. The punch-bars H and K, with their punches, with their lines of punch-tubes adjustable with respect to each other, substantially as and for the purpose herein shown and described.

2. The punch-bars H and K, with their punches, and knife S, adjustable with respect to each other, substantially as and for the purpose herein shown and described.

3. The bar G, in combination with the punch-bars H and K, with their punches, also with knife S, substantially as and for the purpose herein shown and described.

4. The punch-bars H and K, with their punches, knife S, and variable chute F, arranged in relation to each other substantially as and for the purpose herein shown and described.

5. In combination with the knife S, the creasers T and T, substantially as and for the purpose shown and set forth.

6. In combination with the bars H and K, knife S, and chute F, the plates B B, with their openings E and *e*, and substantially as herein shown and described.

7. A machine combining the lines of punch tubes, a knife, and creasers, substantially as herein shown and described.

8. A machine for punching, splitting, and creasing the crown-piece of bridles, combining the frame A, cam-lever N, plunger M, bar G, punch-holders H and K and their punches, knife S, creasers T T, guide-chute F, flanges B B, and openings E, *e*, and *c*, substantially as herein shown and described.

145,293.—Steam-Generator.—ELBRIDGE GODDARD, St. Louis, Mo. Application filed June 7, 1873.

The steam-generator is provided with inclined circulating-pipes, which project beyond the fire-walls at both ends to facilitate repairs, and are connected at the front and rear at the lowest point, whereby a constant and rapid circulation is kept up.

Claim.—The combination of the boiler A, pipes C, C', D, E, G, and H, both ends of the pipes C C', the whole of the pipes D and G and E, and the outer end of the pipe H, outside of the fire-walls, inclosing the boiler, and all constructed, arranged, and operating substantially as and for the purpose shown and specified.

145,294.—Hydrant.—WILLIAM H. GRAHAM, St. Louis, Mo. Application filed August 21, 1873.

A recessed plunger has an upper packing-cup, with an adjustable sleeve slotted diagonally to contract and fit flush with the circumference of the body of the plunger, and when expanded to allow the sediment that passes to lodge in the recessed part of the plunger, so as not to effect the spring-like action of the sleeve.

Claim.—The combination of plunger C, upper packing-cup E, adjustable sleeve D, lower packing-cup c^2, valve-packing c^1, and valve-cap *c*, as and for the purpose set forth.

145,295.—Shoe-Knife.—ANDREW J. HALL, Farmington, N. H., assignor of one-half his right to JOHN F. CLOUTMAN. Application filed October 29, 1873.

Adapted to trimming the shank of a boot or shoe.

Claim.—1. A shoe-knife having a curved blade, substantially as shown, and for the purpose set forth.

2. On a shoe-knife, the combination of the curve C and rim D, substantially as and for the purpose set forth.

145,296.—Stereoscopic Camera.—WARREN HARRIS, Danville, Vt. Application filed August 24, 1872.

Claim.—The combination of two reflectors, with the two object-glasses of a stereoscopic camera, the two object-glasses being placed at right angles with each other, with one of the reflectors in front of one object-glass outside of the camera, and the other reflector behind the other object-glass inside of the camera, the two reflectors being at an angle of about forty-five degrees with both the sensitive plate and the object-glasses, substantially as described, and for the purpose set forth.

145,297.—Spool-Stand.—WILLIAM HARRIS, Rochester, N. Y. Application filed March 29, 1873.

Claim.—A spool-stand having the open groove *a*, the eyelets *d*, and superimposed boxes *e* and *f*, and cushion *g*, constructed and arranged substantially as and for the purpose specified.

145,298.—Child's Carriage.—JOSEPH N. HAZELIP, Baltimore, Md. Application filed August 26, 1873.

Claim.—The cast-iron bracket *c* and box B *b*, in combination with bearing-stem *a* and spring c^1, for attachment to and to form seats for the curved brackets *a* of children's carriages, as and for the purpose set forth.

145,299.—Harness-Loop.—FRANCIS HICKMAN, Reading, Pa. Application filed February 17, 1873.

Claim.—The rubber ring A, formed with the channel C to receive the buckle D, and having the flanges *a'* for securing the edges of the strap B, said flanges being extended and joined together on one side of the ring, so as to form the strap-keeper E, all as herein shown and described.

145,300.—Feed-Regulator for Cotton-Openers.—RICHARD KITSON, Lowell, Mass. Application filed August 29, 1873.

One of the cone-pulleys is hung in a weighted swinging frame so as to keep the belt always taut and prevent it slipping, and thereby unduly increasing the speed of the feeding mechanism.

Claim.—In a cotton-lapper evener or feed-regulator, the movable swinging motor-cone C, in combination with the shipping-cone A, the cone-belt, and the feed-connecting mechanism, all arranged and operating in the manner and for the purpose set forth.

145,301.—Fountain-Brush.—RUFUS LAPHAM, New York, N. Y., assignor to HENRY CONDRON, same place. Application filed September 5, 1873.

The hollow handle contains the paint, which flows through apertures in the socket of the brush, between it and an outer casing screwed thereon, to the exterior of the bristles. The flow is regulated by a stop-cock between the socket and the handle.

Claim.—1. The combination of the socket B, provided with apertures *s s*, with the tube D and brush *d*, as and for the purpose set forth.

2. The combination of the brush *d*, provided with the perforated socket B and pipe D, and stop-cock C, as and for the purpose set forth.

145,302.—Folding Coop.—EDWIN P. LAWRENCE, Worcester, Mass. Application filed July 22, 1873.

The ends of the coop are of canvas, and the sides, top and bottom are so hinged that the coop can be folded to occupy little space for transportation.

Claim.—A folding coop or cage, consisting of the front piece A, rear piece B, bottom C, top D, flexible ends E E, and hinges *e h*, said parts being constructed and combined for operation substantially as set forth.

145,303.—Crimping-Machine.—LEWIS P. LUM, Newburg, N. Y. Application filed October 25, 1873.

A series of forms of the contour of a crimped boot-leg are attached to an endless chain-belt, which passes around pulleys, one at each end of the vertical frame, which supports the entire mechanism. The pressure of the crimping-jaws is graduated to conform to varying thickness of stock by means of rubber guide-rolls.

Claim.—1. The jaws V V, one of which is stationary, the other being movable on hinges U^1 U^2, in combination with the inside plates H^1 H^2, for the purpose of bracing the same, substantially as specified.

2. The rubber cushions R R, in combination with the guide-pins T T and tension-screws, or their equivalents, between the jaws V V and inside plates H^1 H^2, arranged substantially as and for the purpose specified.

3. The forms K^1 K^2, provided with the slots *l'* and sliding blocks L, substantially as specified.

4. The forms K^1 K^2, with the holes *i i* along the inside edge, and the sliding blocks L, with the holes *d d*, for the purpose as specified.

5. The chain-wheel Y, provided with single and double cogs, in combination with the chain J, provided with single and double spaces between the links to match the wheel, substantially as specified.

6. The combination of the forms K^1 K^2, slides L, inside plates H^1 H^2, jaws V V, and adjustable rubber cushions R R, with vertical frame B, chain J, and chain-wheel Y, substantially as and for the purpose described.

145,304.—Rotary Steam-Engine.—WILLIAM F. MOODY, Chicago, Ill., assignor to himself, ABEL H. FROST, and CHARLES L. AMES, same place. Application filed July 3, 1873.

The inner revolving cylinder is provided with a chamber having suitable holes, which are plugged with porous substances to allow the chamber to fill with water of condensation, or oil, when used, to lubricate the parts.

Claim.—The cylinder B, provided with a chamber, N, and holes *b*, the latter being plugged with suitable porous substances to allow the chamber to fill with water from condensed steam to lubricate the parts, and allow oil, if used in the chamber, to also lubricate the parts, as and for the purpose set forth.

145,305.—Bedstead.—EDMUND MORRIS, Burlington, N. J. Application filed June 14, 1873.

Each side rail, with its front and bottom posts and legs, is formed of one piece of timber, with a longitudinal saw-cut at each end, which, after being steamed, is opened, and one part bent up and the other down to form post and leg.

Claim.—As a new article of manufacture, a bedstead or crib having each side rail B, contiguous legs C C, and posts D D constructed of a single piece of timber, slitted at its ends and bent in combination with the bent braces F F^2 and head-board G, substantially in the manner and for the purpose above described.

145,306.—Copying and Folding Press.—SAMUEL W. ODELL, St. Louis, Mo. Application filed September 23, 1873.

The written sheet is laid upon the open press. The tissue or copying paper is spread over it. Then the flaps and sides are folded over and secured by the thumb-screw.

Claim.—1. A pocket-press for copying and folding purposes, consisting of hinged press-covers, having one or more folding-leaves, substantially as set forth.

2. A pocket-press for copying and folding purposes, consisting of hinged press-covers having one or more folding-leaves, and the faces of covers and leaves lined, as set forth.

3. The combination of the press covers A A', folding-leaves B B', lining b^3, hand-screw D, and pin-points *c c'*, all constructed to operate as set forth.

145,307.—Corpse-Preserver.—CHARLES O. PECK, Pittsfield, assignor to WILLIAM LESTER, South Hadley, Mass. Application filed September 26, 1873.

The body rests upon a sieve supported by cleats upon the bottom of the receptacle, the head of the corpse being received within the offset, which is closed by glass and a slide. The bottom of ice-box, located in the movable top, is formed of a series of gutters and deflectors, upon which rests a sieve to support the ice, allowing a free circulation of the air around the ice and corpse.

Claim.—The combination of box C with its troughs *m m*, &c., and *n n*, &c., and sieve P, with the box B with its sieve *b*, and tank D with outlet S, the parts being constructed and arranged substantially as shown and described.

145,308.—Electric Signaling Apparatus for Railroads.—FRANK L. POPE, Elizabeth, N. J. Application filed April 2, 1873.

For use at tunnels, draw-bridges, &c., one line of rails divided into insulated sections, the other in connection with earth. System of repeaters at each end of, say, tunnel. Train going in one end sets a primary signal at far end, which signal repeats back and sets a secondary signal at entrance. Train on its exits closes certain circuits, reversing the signals.

Claim.—1. The combination of the electro-magnet C', electro-magnets B B^1, circuit-breaking levers *b* b^1, and circuit-closing devices a^1 and a^3, substantially as and for the purpose herein specified.

2. The combination of the magnet C' for operating a primary signal, the magnet D for operating a secondary signal, and a circuit-closer, a^1, the latter arranged to be actuated by the passage of a train, substantially as herein described.

3. The combination and arrangement of the electro-magnets B and B^1 and armature-levers *b* and b^1, so arranged that the closing of the circuit through one magnet will break the circuits of the other, substantially as herein specified.

4. The arrangement of a primary signal-magnet and a secondary signal-magnet at each end of a section of railroad-track, each secondary signal-magnet being controlled by the action of the primary signal-magnet at the opposite end, substantially as and for the purpose herein specified.

145,309.—Pneumatic Railroad-Signal.—WILLIAM E. PEALL, Washington, D. C. Application filed October 31, 1873.

Along the track is laid a continuous supply-pipe, and parallel thereto a continuous service-pipe, actuating the signals, and connected with the supply-pipe by means of cross-pipes. A passing train opens the signals in front and closes those behind.

Claim.—1. A continuous air-reservoir or supply-pipe, A, laid along any portion of a line of railway, in combination with a series of service-pipes, B B, connected therewith by branch pipes W W, so as to be automatically charged with air therefrom, as required, for the purpose of displaying or sounding a system of signals, substantially as herein set forth.

2. The cock M, constructed and operating substantially as described, in combination with the air-passages L, L', N, *f*, *g*, and *g'*.

3. The cylindrical space E, in combination with the connected valve *a* and plunger I, and the air-passages F, L, G, and *g*, substantially as herein described.

4. The valve *i*, in combination with the air-supply pipe A and passage N, the rod R, lever Q, cock M, and plunger *p*, substantially as herein described.

5. The lever Q and its lugs *q q*, in combination with the cock M and its projecting pins *s s'*, and with the forked end or yoke of the rod P, substantially as herein described.

6. In combination with the rod P, plunger *p*, and cylinder H, the exhaust-aperture *e*, perforated plunger *r*, and air-passages G and G', substantially as herein described.

7. The air-commutator D—a combination, substantially as herein set forth, of the several devices enumerated in the four preceding claims, to co-operate substantially as and for the purpose herein set forth.

145,310.—Umbrella.—GEORGE W. PRESSEY, Hammonton, N. J. Application filed June 27, 1873.

The ribs are in sections, and the stick is made telescopic, so the umbrella may be compactly folded into a small bundle.

Claim.—1. The sectional telescopic staff A A^1 A^2, the connecting-wires *b*, links *d*, locking-springs *f* f^1 f^2, flange *g*, runner A, jointed ribs C C', and braces D, and a suitable cover, B, constructed and arranged to operate substantially as described and shown.

2. The combination and arrangement of the sectional ribs C C', the former being provided with the socket *i*, having the braces D pivoted thereto, and the pin *j*, the rib C' having a hook or its equivalent to engage with the said pin, substantially as and for the purpose set forth.

3. The combination of the elastic bands *l* with the rib sections C C', substantially as and for the purpose set forth.

145,311.—Plane-Iron.—ERNEST QUAST, Jerseyville, Ill. Application filed February 18, 1873.

The plane-iron is composed of two parts halved together—the part A of malleable iron, and B of steel.

Claim.—The plane-bit described, having the iron shank A and steel cutting-part B, as a new article of manufacture.

145,312.—Bureau and Wardrobe Combined.—HANS H. STAUGAARD, Chicago, Ill. Application filed May 31, 1873.

The upper drawers of the bureau are shortened, so that the wardrobe may extend downward to the rear of them, and the bureau and wardrobe are connected together by suitable clamps.

Claim.—The combination of bureau A with wardrobe B by extending the latter in the rear of the upper shorter drawers *b*, connected by clamps *f*, to be detachable, substantially as and for the purpose described.

145,313.—Medical Compound for Treating the Hair.—WILLAMON F. STATEN, Jasper, Fla. Application filed October 24, 1873.

Alcohol, oil of ricini, oil of lavender, oil of lemon, oil of neroli, oil of rosemary, tincture of musk, borate of soda, pulverized.

Claim.—The compound above described for curling and frizzing the human hair, substantially as specified.

145,314.—Grain and Malt Cleaner and Crusher.—NICHOLAS THIELEN, Sacramento, Cal. Application filed March 6, 1873.

Supplementary screen *q* placed in shaking shoes. On *q* is arranged, underneath hopper, a plate consisting of two triangular pieces elevated at rear point of junction to spread grain, &c., evenly on *q*.

Claim.—The combination, in the shaking screen-frame A, of the main screen *p*, adjustable short screen *q*, with its spreading-plate *e*, and the apron *i*, combined and arranged substantially as and for the purpose above described.

145,315.—Stop-Hinge.—GEORGE C. THOMAS, Brooklyn, N. Y., assignor to SCOVILL MANUFACTURING COMPANY, Waterbury, Conn. Application filed April 30, 1873.

Claim.—A hinge, the blanks or halves of which are formed with a shoulder or stop, A, having its side coincident with the part B, which forms the eye, all substantially as described and shown, for the purpose specified.

145,316.—Loom.—SAMUEL T. THOMAS, Gilford, N. H. Application filed August 29, 1873.

The drop-boxes are operated by star-cams, controlled by a pattern-chain, which give a reciprocating movement to slides working flanges on the box-levers, each slide embracing the flanges of two adjacent levers. By means of a vertically-reciprocating rod, connected with the weft-stop mechanism and provided with horizontal arms, the pawl of the pattern-cylinder and the pawls which drive the star-cams are carried out of gear to arrest their movements when the weft-stop mechanism is operated. The protector-rod carries a finger under the lay, so arranged that, when a shuttle to be thrown remains in either box, it raises the hooked end of a spring-arm pivoted to the knocking-off lever under the breast-beam, and brings the hook within the path of a projection on the lay as it moves back, and stops the loom. The heddles are operated by vertical levers and grooved-face cams, which cams receive an intermittent motion from a pin-wheel driven by a crank-pin on the end of the crank-shaft, by which means the cams are stationary during one-half of the rotation of the crank-shaft.

Claim.—1. The combination, with the drop-boxes and the pattern mechanism, of the cam-slotted wheel *b*, lovers *c*, links *g*, slides A, and intervening mechanism, operating to positively move the boxes to position in each direction, and to positively hold them in position, substantially as described.

2. In combination with the cam-wheels *b* and pawls *u*, and with the pattern mechanism, the vertical rod c^3, link c^3, and the mechanism connected therewith, and with the weft-stop motion, to effect the stoppage of the cams and pattern cards and cylinder from the weft-stop motion, substantially as described.

3. In combination with the lay a^4 and breast-beam b^4, and with the lever l^4, operated by the shuttle, the arms c^4 and h^4 and spring g^4, having a latch, A^4, and secured to the knocking-off lever i^4, operating to stop the loom, substantially as described.

4. In combination with the harness levers, the intermittently-operated cams c^5, wheel g^5, and pins i^5, and the crank-pin h^5 (on the crank-shaft a^5) and catch-pawl b^5, the whole being arranged and operating substantially as and for the purposes described.

145,317.—Refrigerator.—ROBERT THOMSON, Springfield, Ohio. Application filed August 11, 1873.

A large wooden tube, perforated at its ends, is inserted in the well and supported by lugs resting upon the platform covering the well. Within the tube a galvanized-iron frame slides freely, and contains the pans in which the food is placed.

Claim.—1. A combined well refrigerator and elevator, for the purpose of preserving food without the use of ice in summer and from freezing in winter, consisting of a tube or pipe projected into a well to a sufficient depth to reach the cold air near the water, and having its sides pierced with openings near the lower end to allow air to circulate freely among the articles of food contained in a case or frame suspended in the same, substantially in the manner shown and described.

2. Tube A, with its lugs *l l* and slots *a a*, constructed and arranged substantially as shown and described.

3. In combination with tube A, with its smaller tube F, lugs *l l*, slots *a a*, cord *r*, pulleys *p p'*, and crank *s*, frame B, with its pans *b b b* and bale *c*, substantially as shown and described.

4. In combination with the platform P of the well W, the tube A, with its lugs *l l* and slots *a a*, substantially as shown and described, as and for the purpose hereinbefore set forth.

145,318.—Wash-Boiler.—WILLIAM W. TURTELOT, Rome, N. Y. Application filed May 7, 1873.

Is constructed with apartments at each end of the center one, one with a strainer in the partition, the other with openings for passing out the water, having covers or bonnets for giving it direction, which passes through the clothes, over a grate, and out of openings through the flange of the cover, which connect with the openings in the partition, and out of the opening for its discharge.

Claim.—1. The apertures *i i*, with hoods *d d* in the partition C, forming communication between the clothes and receiving-chambers of the boiler, for the purposes herein set forth.

2. The lid G, provided with grating E' and apertures *i i*, for the purposes herein set forth.

3. The combination, with the boiler A, of the partitions B C, strainer *a*, apertures *i* with hoods *d*, lid G, and gratings E E', all constructed and arranged substantially as and for the purposes herein set forth.

145,319.—Soap-Cutting Machine.—JOHN B. ULTECH, Cambridge, Mass. Application filed May 28, 1873.

The bars of a grill fit between fixed bars, and rest upon a table hung upon a pivot at one end, and resting upon a cam at the other, so that the grill is raised or lowered to form an even surface for the soap, or to aid in the removal of the same. The table, upon which the soap is first placed, is provided with blades for trimming the soap, and with obutes for carrying off the cuttings. The cutting-frame is provided with plates that admit of vertical adjustment to suit the thickness of the soap.

Claim.—1. In a soap-cutting machine, the combination of the grill N N N with the table Q and cam R, operating substantially as described, and for the purpose set forth.

2. The combination of the cutting-blocks L with the table E' and sluices M, substantially as described, and for the purpose set forth.

3. The combination of the adjustable plate H, upon which the templets or cutters G G are fastened, with the frame D, substantially as described, and for the purpose set forth.

145,320.—Cart-Loading Scoop.—AARON VREELAND, Mont Clair, N. J. Application filed September 26, 1873.

The scoop, with its operative appliances, is so arranged as to be readily attached to and detached from the cart. The supports

for the windlasses are pivoted to a cross-bar at *e*. By turning the windlass *g* in the direction of the arrow the rope *i* is wound around the drum, and the rear of the scoop is elevated. The front end of the scoop engages with the earth, and, by the forward motion of the cart, the scoop is filled. When the scoop is filled the windlass *f*, on which the ropes *m* and *n* are wound, is turned. The winding of the rope *n* elevates the scoop, and the winding of the rope *m* draws the loaded scoop forward into the cart.

Claim.—The scoop *a*, connected with and operated by the swing-windlasses *g* and *f*, substantially as and for the purposes specified.

145,321.—Hay-Loader.—CHARLES E. WARNER, Burlington, Kans. Application filed December 14, 1872.

The rake-head is provided with holes at different angles, so that a weighted lever holds the rake-teeth to or from the ground, at the will of the operator.

Claim.—The weight S, adjustable, by holes, at different angles in the shaft, in combination with the shaft P, for the purpose of retaining the rake-teeth Q in a depressed or elevated position, substantially as shown and described.

145,322.—Spinning-Machine.—CHAUNCEY WILLIAMS, SAMUEL M. WILLIAMS, and HENRY M. WILLIAMS, Coldwater, Mich., assignors to THE WILLIAMS CONTINUOUS SPINNER COMPANY, same place. Application filed July 11, 1873.

An arrangement of mechanism for driving the drawing and delivery rolls; an improved construction of twisting-tube; devices for governing the rotation of the spinning-rings; and mechanism for regulating the reciprocation of the spindle-rails so as to properly wind the cops.

Claim.—1. The combination and arrangement of the shaft B, pulleys Q R, pinions R^2 R^3 R^4 R^5 S S^2 T^2, shafts R^1 and S^1, and train of gears U U^1 U^2 U^3 U^4 U^5 for operating the drawing-roll shafts T T^1, feed-roll shafts W W^1, and roving-drum shaft X, substantially as and for the purpose set forth.

2. The twisting-tube Y, in combination with the removable nut Y^1, having the cruciform slot, as described.

3. The combination of the bearings D D^1 and the spinning-rings with the brake *e* and treadles, as described.

4. In combination with rings E and bearing D, the reciprocating spindle-bearings F F^1, the guides *d d*, brake-block *e*, shaft *p*, bolts *c*, and treadles *q*, substantially as and for the purpose specified.

5. The combination, with the spindle-bearing F, of the cross-heads *f*, connecting-rod I, lever I^1, pin *i* for pivoting the said rod I in the slot *g* of said lever, the eccentric-rods I^2, eccentrics H, shaft J, bevel-pinion K, gear K^1, shaft K^2, worm-wheel K^3, and the worm K^4 on the shaft B, the gears L L^1 L^2 L^3, shaft M, wipers N, and bell-cranks O, having the pins *i* engaged with their slots *g'*, for reciprocating the spindle-bearing F, in the manner described.

145,323.—Sleigh.—ARTHUR A. ABBOTT, Chicago, Ill. Application filed June 4, 1873.

Claim.—In combination with a sleigh-runner, a sleigh-knee, C, having box D, provided with plug E, substantially as and for the purpose set forth.

145,324.—Bee-Hive.—LEONIDAS ADAMS, Mason City, Ill. Application filed July 26, 1873.

When the bees enter the outer case they ascend into the hive; but the moths descend an incline to a perforated floor, whence they are unable to ascend, the flange, inclined upon all sides, being steep and reaching into the middle of the box or trap. A slide beneath the perforated floor serves to totally close the hive when desired. The case and inner parts are in duplicate, co incident slots between them giving passage to the bees. Hooks and staples hold together the several parts.

Claim.—In a hive of the construction described, the moth-trap E, having the flange *g*, perforated bottom *m*, and slide *n*, as and for the purpose set forth.

145,325.—Apparatus for Compressing Cast Metals in Liquid State.—HORACE W. BARNUM, Omaha, Nebr. Application filed September 27, 1873.

A portable compressed-air reservoir, having a pump attached, is connected by a pipe to a flanged cap, which can be clamped to a cylinder placed on the flask. The compressed air, being admitted from the reservoir, acts directly upon the liquid metal.

Claim.—1. The combination, with the flask and cylinder H G, of the removable cap F, rubber pipe A', and movable air-cylinder A, and pump D, as shown and described.

2. The cylinder G and removable cap F, connected by rim and groove *a a'*, and flange and couplings *b d*, in combination with the flask H, said cap and cylinder united forming a receiver for the air from the forcing apparatus, as shown and described.

145,326.—Composition for Lining Furnaces, Crucibles, &c.—ALFRED E. BATES, Monroe, Mich. Application filed October 27, 1873.

Claim.—A fire-proof composition consisting of about three (3) parts ground or crushed soap-stone, two (2) parts of fire clay, and one (1) part fire-sand, as herein set forth.

145,327.—Saw-Gumming Machine.—HENRY BAUGHMAN, Dorn's Gold Mine, S. C. Application filed August 26, 1873.

The saw is held in the clasp S T, and operated upon by the rotary gumming-tool A, mounted in the oscillating frame E. The upward movement of the frame E is regulated by the stop-button W, and its downward movement by the eccentric-dog K.

Claim.—1. The combination of the stop-button *w* with the oscillating frame E, stationary frame G, and the rotary gumming-tool, substantially as specified.

2. The adjustable circular-saw clamp S T, center U, and the holder V, combined with the oscillating rotary gumming-tool A, and detachably connected to the supporting-frame of said tool, substantially as specified.

145,328.—Carriage-Curtain Fastening.—FREDERICK BAUMGARTNER, Brooklyn, N. Y. Application filed August 9, 1872.

Claim.—The button-hole plate D, designed and adapted to be secured to the curtain by the ring E, so as to form, with the curtain, a pocket for the head of a knob, C, with which it is to be used, substantially as described.

145,329.—Meat-Holder.—SARAH BRISSEL, Shamokin, Pa. Application filed August 30, 1873.

A suitable board has two vertical screw-bolts, which pass through the ends of a cross-bar, and is held and adjusted by nuts. Between the bolts, in the board, are holes for the insertion of vertical rollers.

Claim.—The meat-holder, consisting of a board, B, having vertical screw-bolts *b*, with lateral cross-bar C, which is pressed on the meat by thumb-screws *d*, and vertical side rollers D, adjustable in holes *e* of the board, to clamp the meat firmly and feed it for cutting, substantially as specified.

145,330.—Muff-Stand.—LOUIS BERGTOLD, Buffalo, N. Y. Application filed November 24, 1873.

Claim.—The standard B, ring C, and arms E and F, constructed, combined, and arranged substantially as and for the purposes herein shown and described.

145,331.—Wheel-Cultivator.—GEORGE BRADLEY, Rockford, Ill., assignor to CHARLES R. CHANDLER, same place. Application filed August 7, 1873.

The long shovel-beams are pivoted at the front to oblique hangers for both lateral and vertical movement. By means of hangers, loosely jointed to the rear part of the beams and to a slotted cross-bar supported by long hand-levers, the plows can be moved in any direction and either beam raised independently of the other.

Claim.—1. The pivoted upright link-rods F and slotted connecting-bar F', in combination with the bracket C and swivel-block D, for effecting the adjustment of plow-beams E, as described.

2. The racks H H, hand-levers G G, and loops *g g*, in combination with the uprights F and slotted connecting-bar F', arranged and operating substantially as described.

145,332.—Burglar-Alarm.—HENRY L. BROWN, Middletown, Conn. Application filed November 8, 1873.

Two gas-burners are arranged side by side. A minute flame burns in one when the apparatus is set for action. The cock of the other is connected by a chain and lever to the door or window, so that the act of opening turns on the gas. This is ignited on issuing, and the blaze severs a cord stretched above it, thereby releasing an alarm.

Claim.—1. In combination with an alarm mechanism, a combustible trip-cord, or its equivalent, and a gas-supply pipe provided with a suitable stop-cock, connected with a device operated by a door or window, and a supplementary flame or burner, substantially as shown and described, whereby, when said door or window is opened, the gas will be let on and ignited, and the alarm sounded, as set forth.

2. The wire or cord J and burners E and F, in combination with a burglar-alarm, substantially as described.

145,333.—Carriage-Spring.—JACOB BULLOCK, Windsor, N. Y. Application filed June 20, 1873.

Claim.—The wooden springs A and steel springs C, having the interposed block M and shackles *i*, and attached to the frame D by clips E, all combined substantially as and for the purposes described.

145,334.—Milk-Can.—JAMES F. CASS, L'Original, Canada. Application filed July 19, 1873.

A conical removable top, having air-tubes descending from near its base, a large air-tube descending from its apex, with lateral ascending perforations into this tube near its upper end.

Claim.—The combination of a conical milk-can cover, B, having air inlet and outlet passages C E, and pipes D and F, substantially as specified.

145,335.—Windmill.—MATTHEW T. CHAPMAN and MARK C. CHAPMAN, Aurora, Ill. Application filed September 17, 1873.

The beam of the vane is fitted in a socket cast upon the revolving piece, which is provided with casters or rollers above and below. The upper casters run upon the upper rim of the flange, which forms the top of the socket-piece. The flange on the top of swivel-piece rests on the casters and rotates them, the balls acting as frictionless bearings. The crank-shaft of the wheel revolves in a sleeve or journal-box, rigidly attached to the top of the swivel-piece, which rotates in such a manner as to bring the wheel edgewise to the wind when its speed is to be regulated.

Claim.—1. The combination of the revolving piece B, casters *b* and *b'*, socket-piece C, swivel-piece E, having a flange, *c*, and journal-box *c'*, arm A, annular piece B', balls *d*, beam A, chain *r*, provided with the adjustable weight *g*, chain K, and tubular arm *m*, all operating together as described.

2. The combination of the annular piece B', casters *b* and *b'*,

socket-piece C, swival-piece E, provided with a flange, *e*, and journal-box *e'*, arm A, beam A, chain *z*, rod *y*, provided with the adjustable weight *x*, chain K, and tubular arm *m*, all operating together as described.

145,336.—Manufacture of Horseshoe-Nails.—HARLEY D. COWLES, Montreal, Canada, assignor to JAMES TERRY, Terryville, Conn. Application filed June 16, 1873.

The die A is provided with gages C and D and a stop, F. Said stop is made adjustable by means of a set-screw. The punch B is provided with a presser-foot, F, which, being in advance of the punch, holds the metal firmly until the punch has cut a nail and receded. The die A and punch B correspond in shape to the contour of the nail to be produced, and are each provided with an incline, *c*, said incline being for the purpose of bringing the points of the nails central.

Claim.—1. The die A and punch B, in combination with the presser-foot F, stop E, and gages C D, all substantially as and for the purpose set forth.

2. In a die and punch for cutting nails, the incline *c*, when arranged in relation to the points of the nails cut by said die and punch, substantially as and for the purpose described.

145,337.—Eye and Lung Protector.—GEORGE A. CROFUTT, New York, N. Y. Application filed November 5, 1873.

The upper part of a domino, or half-mask, is made to closely fit around the eyes, and is furnished with plates of glass or mica, so that it may form a partial protection against smoke, &c., when the cloth is wetted.

Claim.—The duplex shell A, provided with glasses or transparent eye-pieces A', and shaped to fit the face about the eyes, as described, in combination with the curtain B, provided with a suitable means of securing the same to the head, substantially as and for the purpose set forth.

145,338.—Butter-Worker.—DANIEL W. DAKE, Beloit, Wis. Application filed September 11, 1873.

An endless apron over rollers at the ends of the trough-like frame; a grooved pressing-roller and smooth counter-roller beneath.

Claim.—In a butter-worker, the combination and arrangement of the endless and corrugated apron C, the adjustable and corrugated roller D, and the adjustable roller B, substantially as and for the purpose specified.

145,339.—Railway-Rail Joint.—WILLIAM G. DUNN, Fairland, Ind., assignor of one-half his right to GRANVILLE S. HARMALL, same place. Application filed August 7, 1873.

The plate *a* forms a clamping device under pressure of the wheel, which firmly compresses the rail and fish-plate at the joint, between the projections of the chair *c c*.

Claim.—The combination and arrangement of the plate *a*, the chair *c c*, the segmental rail *b*, and the T-rails *d* and *d*, for the purpose and in the manner substantially as set forth.

145,340.—Ice-Creeper.—REGINALD H. EARLE, St. Johns, Newfoundland. Application filed October 4, 1873.

Claim.—The ice-creeper, constructed of the grooved plate A, the plates B, sliding on each other, and having spikes C, and the set-screw D, arranged as shown and described.

145,341.—Inking Apparatus for Printing-Presses.—MARTIN ENGLAND, New York, N. Y. Application filed August 30, 1873.

As the arm K moves it moves the rod, and through this the lever G, the inking and distributing rollers. The stop Q is adjustable to control play of distributing-roller. The ink-fountain is adjustable.

Claim.—1. An automatic brayer for printing-presses, consisting essentially of the ink-box A, ink-roller B, carrier-roller D, rock-lever G, rod I, stop Q, eye-plate J, standard R, and arm S, the ink-box being adjustable upon the arm S, as and for the purpose specified.

2. The combination of the ink-box A, ink-roller B, with the rock-lever G, pawls O, ratchets P, arm M, spring N, and carrier-roller D, as and for the purpose specified.

3. The within-described means for communicating motion from the ink-roller frame of a Gordon press to the rock-lever G of the brayer, the same consisting of the rod I, stop Q, and eye-plate J, as set forth.

145,342.—Vibrating Propeller for Vessels.—JAMES D. FRASER, Pictou, Canada. Application filed August 31, 1872.

The vibrating arms D are turned a quarter of a revolution for the purpose of reversing the operation of the paddles.

Claim.—The adjusting-bars H and nuts K, in combination with the hollow crank-shaft C, pinion G, shaft D, arms F, and hinged paddles E, as shown and described, to operate as and for the purpose specified.

145,343.—Combined Shutter and Window Fastener. WILLIAM T. FEY, Brooklyn, N. Y. Application filed October 18, 1873.

The stud-catch is arranged upon the inside of the shutter. A swing-lever, inclosed beneath the sill, takes over the stud-catch with one end, and with the other secures a pin, which projects downward from the sash.

Claim.—The shutter having stud-catch C in front, and subjacent spring J in the rear, combined with a sash, K, having the spring-lever I D, and a sill having stud-catch L, as and for the purpose described.

145,344.—Urinal.—JOHN C. GARKEY, New York, N. Y. Application filed November 15, 1873.

Claim.—As a new article of manufacture, a urinal for bed-ridden persons which has a broad oval base with covered rear part, being provided with a handle in front of the center of the base, and a downward-curved forward-projecting spout, arranged in the manner substantially as and for the purposes described.

145,345.—Process of Manufacturing Artificial Marble, and Veining the same.—FREDERIC H. HALL, Hackensack, N. J. Application filed November 26, 1873.

Claim.—In the manufacture of marble, the process of veining the same by flowing or floating the colors preparatory to incorporation with cement-paste tinted or in its natural state, substantially as described.

145,346.—Water-Wheel.—MORDECA H. HEYLMAN, Oshkosh, Wis. Application filed November 1, 1873.

The plates which form the issues are parallel to each other. At the junction of each pair are shoulders to receive the full reactionary force of the water.

Claim.—The concentric circular plates G H, forming the issue F, in combination with the shoulder J, whether curved, inclined, or radial to the wheel, substantially as specified.

145,347.—Construction of Vessels.—HERMANN HIRSCH, Middlesex county, England. Application filed November 14, 1872.

Claim.—The keel swelling upward and outward, bilges swelling outward and downward, and sides having an outward curvature near and above the water-line, when so constructed and combined that all horizontal and vertical sections through the bilges will partake of the form of wave-curves, as and for the purposes described.

145,348.—Shuttle for Sewing-Machines.—GEORGE W. HUNTER, Washington, D. C., assignor of one-half his right to HENRY M. BAKER, WM. F. STONE, and JAS. H. VERMILYA, same place. Application filed October 27, 1873.

The face of the shuttle is provided with a thread-guiding slot and a tension-spring, and the bobbin, without journals, is introduced in the shuttle through a hole bored in the end.

Claim.—1. A cylindrically-bored shuttle having its face provided with a curved or straight slot for the passage of the thread, and with a tension-spring in a depression in such face, as and for the purpose described.

2. The cylindrically-bored shuttle provided in its face with an open-ended slot for the passage of the thread, as shown and described.

3. The shuttle having its face slotted, as described, when combined with a bobbin without journals or journal-receiving depressions, and with its heads resting against the shell of the shuttle.

145,349.—Skate.—CHARLES W. JENKINS, New York, N. Y. Application filed July 1, 1870.

Claim.—1. A skate having a point or pivot, A', on the toe, adapted to serve in the manner and for the purposes herein set forth.

2. A skate having a pivot-point on the toe, with one or more shoulders adjacent, so as to catch in the ice and support the skater in performing toe-movements, as herein specified.

3. The toe-point A', with the rounded shoulders on the edge of the iron or runner adjacent thereto, when constructed and arranged, relatively to the main body of the skate-runner, substantially in the manner and for the purposes herein set forth.

4. The sharp-cornered skate-clamps E E, mounted adjustably at the sides of skates, and adapted to perform the double functions of attaching the skate securely to the foot, and also of serving as auxiliary runners when the skate is greatly inclined, substantially as herein specified.

145,350.—Manufacture of Water-Gas.—EZRA J. JERZMANOWSKI, New York, N. Y. Application filed October 8, 1873.

Claim.—The process of forming a fixed gas for illuminating purposes by first producing a mechanical mixture of gas from water and the vapors of some hydrocarbon, and then combining the same with gas evolved from bituminous coal heated in a retort in the usual manner, and the whole volume of gas thus produced being finally and fully fixed by passing it through some suitable refracting substance, substantially as and for the purpose set forth.

145,351.—Metallic Bracket.—ALBERT D. JUDD, New Haven, Conn. Application filed May 20, 1873.

The bracket is constructed in three parts, the wall and shelf plates and the arch or brace, and are held together by hooks and holes cast in the parts.

Claim.—1. The plates *c* and *m*, separate from the brace *a* and united to each other and to such brace by the hooks *a b*, and dovetail block *d* or its equivalent, substantially as set forth.

2. The wall-plate *c*, cast separate from the bracket *a* and plate *m*, and provided with the opening for the hook *c*, and interlocking with the plate *m* at the angle, substantially as set forth.

145,352.—Inkstand.—ALBERT D. JUDD, New Haven, Conn. Application filed May 20, 1873.

Claim.—1. The sponge-holding cup, united to the inkstand-cover by a hinge, in combination with the removable ink-bottle and the stand receiving the same, whereby the cup performs the two duties of a support for the cover and a holder for the sponge, as set forth.

2. The sponge-holding cup *f* and elastic band or cord to hold the sponge in place, as specified.

145,353.—Car-Coupling.—XAVER KRAFT and JOHN F. BOERCKEL, Allentown, Pa. Application filed September 20, 1873.

The link is elevated by means of the lever D, and is held in position to couple by the pin *g*, which fits in inclined holes in the draw-head so as to drop out immediately on being relieved of the pressure of the lever D upon it, caused by the weight of the link on the outer end of said lever.

Claim.—1. The combination of draw-head B, coupling-link C, and lever D, pivoted on cross-bolt *b*, and pin *g*, substantially as set forth.

2. The draw-head B, having holes *f*, upwardly inclined, and at different heights, to insure downward-inclined position of pin *g*, and the dropping of the pin on discontinuing pressure of lever D, as set forth.

145,354.—Mitering-Machine.—CHRISTIAN LOETSCHER, Dubuque, Iowa. Application filed October 4, 1873.

The guides are hinged, and made longitudinally, as well as horizontally, adjustable.

Claim.—1. In combination with the sliding bar B, the guide I, having the sliding and axially-adjustable hinge-connection G H, with the slotted pivoted plate C, all constructed, arranged, and operating as shown and described.

2. The combination of the adjustable dovetailed stop-bar L with the hinged guide I of the mitering-machine, substantially as herein shown and described.

145,355.—Cooking-Stove.—SOLOMON LONG, Mayville, Ohio. Application filed November 1, 1873.

The products of combustion may be made to rise to the top of the stove and pass along close to the pot-holes by means of plates hinged, one at the edge of the fire-pot and the other near the exit-flue. When the former is raised to a vertical position it lifts the latter, and sustains it in a horizontal position.

Claim.—The combination of plate G pivoted at the rear end of the combustion-chamber, and the plate I pivoted at the edge of the fire-box, the former being arranged to lap over and be supported by the other in the elevated and inclined position, respectively, as shown and described.

145,356.—Corn-Sheller.—JOHN MARSHALL, Cordova, Ill. Application filed March 29, 1873.

The concave is formed of sections having notched edges, and placed so as to leave longitudinal spaces between them.

Claim.—1. The concave formed of the sections G, having notches in their edges, and arranged near together, as and for the purpose specified.

2. The ribs F, made flat on the under side, oval on the upper side, and terminating at their ends in tapered shanks, and secured to the hollow metallic cylinder by bending said shanks, as shown and described.

145,357.—Device for Forming Bale-Ties.—JOHN MCCLEAN, New Orleans, La., assignor to FREDERIC COOK, same place. Application filed September 13, 1873.

A lever, F, hinged at an angle of forty-five degrees to the plane of the band, when brought down, bends the end over a plate, E, at right angles to the remainder of the strip. A latch, I, is fastened down over the bent portion after the lever F is raised, and a lever, K, completes the tie by lapping the end up over the latch.

Claim.—In a bale-tie-forming machine the combination of the angular shaping-edge H, the holder I, and the two hinged bending-levers F and K for shaping and bending the end of a bale-tie, substantially as described and represented.

145,358.—Brick-Machine.—JAMES M. MITCHELL, Dunlap, Iowa. Application filed April 4, 1873.

A single downward movement of the hand-lever presses one brick, and delivers the brick previously pressed from the mold.

Claim.—1. In combination with the movable molds C, the plunger B, the lever F, rod *g*, and hand-lever G, constructed and operating as described.

2. In combination with the hand-lever G and the pressing-plunger B, operated thereby, the sliding molds C and the delivering-plungers *H*, also operated by the hand-lever G, the parts being all constructed and arranged to operate substantially as shown.

145,359.—Curtain-Fixture.—CHARLES C. MOORE, New York, N. Y. Application filed September 7, 1872.

A wooden block is secured within a metal tube, and is axially perforated to receive the pulley-screw. The outer end of the block is also recessed to allow the passage of the cord from an opening on the outside of the tube to another opening on the end of the tube. The cord-pulley is formed by the flange on the head of the screw and the flange on the end of the tube.

Claim.—1. The sheet-metal tubes B, having blocks E secured therein, and axially perforated, in combination with the screw C, as and for the purpose specified.

2. The tubes B having holes b^1 b^1 formed in their sides and ends, respectively, to adapt them to receive the cord D, as and for the purpose specified.

3. In combination with the cord D, the flanges or head b^1 and *c'* formed upon the end of the tube B and the head of the screw C, substantially as herein shown and described, to serve as guides to the cord D, as and for the purpose set forth.

145,360.—Stove-Grate.—GEORGE R. MOORE, Philadelphia, Pa. Application filed May 9, 1873.

By means of the notches the grate may be adjusted at various elevations.

Claim.—1. The grate A, hanging upon and in combination with the horizontal lever D, extending around it and across the ash-pit, affording it a free space for revolving or tipping, and the rod E for raising and lowering the grate at will, substantially as and for the purpose herein set forth.

2. The combination of the grate A, arm B, and rod C with the levers D D and rod E.

145,361.—Subsoil Gang-Plow.—CHRISTIAN MYERS, Marysville, Cal., assignor to himself and FRANCIS J. SCHAEFFER, Davenport, Iowa. Application filed August 16, 1873.

The plowshare and lower section of land-side are connected rigidly, and overlap the corresponding parts of the plow, where they are held by a hook on the under side of the share engaging in a slot beneath, and by a wedge passing through the two parts of the land-side.

Claim.—The combination of detachable share G, having hooks *s* and rear extension of point H, with under side G' and land-side H', by means of slot *e'*, apertures *f f'*, and wedge-piece *g*, for the purpose set forth.

145,362.—Gate-Fastener.—JOSEPH H. NICHOLS, La Fayette, Ill. Application filed October 25, 1873.

The gate is lifted by a cam-lever, which works under a projection secured upon the edge of the perpendicular part of the frame, and its end rails take under catches on the post.

Claim.—The combination of the weighted lever D with post E, catches C, and the gate A, having piece F and projections to take under said catches, as shown and described, to operate as specified.

145,363.—Process of Manufacturing Artificial Stone. ERNEST L. RANSOME, San Francisco, Cal. Application filed October 18, 1873.

Claim.—The process herein described of removing soluble salts or other valuable liquids from artificial stone by means of a current of air, substantially as set forth.

145,364.—Rock-Drill.—WILLIAM ROBERTS, Jr., Copper Falls, Mich. Application filed October 18, 1873.

The drill is secured within the socket between two half-boxes, which are forced together by means of wedge-shaped bolts.

Claim.—The combination of the socketed solid head A, half-boxes D, bolts F, and nuts G, substantially as specified.

145,365.—Railway-Car.—CYRUS W. SALADEE, Pittsburg, Pa.—Case B. Application filed November 21, 1873.

Claim.—The independent bottom B B', provided with guards P, and supported upon hangers L, suspended from springs placed above the bottom and secured to the outer body A, substantially as and for the purpose set forth.

145,366.—Railway-Car.—CYRUS W. SALADEE, Pittsburg, Pa. Application filed April 4, 1873.

The car-body is mounted upon an independent frame-work, and supported upon springs, while the supporting-frame is directly connected with the trucks.

Claim.—1. In a railway-car, the combination of the independent frame-work B C C', provided with suitable springs on which to support the car-body A, substantially as and for the purpose set forth.

2. In combination with the bottom of the car-body, the equalising-shafts D and D, substantially as and for the purpose set forth.

145,367.—Towel-Rack.—CHARLES SCHERMERHORN, New York, N. Y. Application filed June 28, 1873.

To a suitable board are attached one or more metal hinges. The hinges are rigidly attached by one of the extensions to said board. The other extension of each hinge has loops or eyes formed in it, through which are passed wooden slats or rounds. The swinging part of the extension is provided with a shoulder, which serves to stop the rack-frame from dropping beyond a horizontal position.

Claim.—1. The hinges B B' C C', the latter being provided with loops M N, and with the center *d* held out from the wall or board A, as herein specified.

2. The completed frame-work described, having the connecting-board A and slats *m n*, in combination with one or more of the hinges B B' C C' *d* M N, and adapted to serve as and for the purposes herein specified.

145,368.—Latch for Gates, &c.—GEORGE N. SHARP, La Plata, Mo. Application filed October 18, 1873.

The lever for operating the latch is provided with a plate, the ends of which rest upon the top edge of the case, and serve as fulcrums to the lever, so that the latch may be raised by moving the upper part of the lever outward, inward, or upward.

Claim.—1. The plate d', formed upon the lever D, in combination with the slotted upper edge of the case A, in which the catch C is pivoted, substantially as herein shown and described.

2. The flanges a', formed upon the inner surface of the inner part of the case A, and arranged in connection with each other and the plate d' of the lever D, substantially as herein shown and described.

145,369.—Low-Water Indicator.—FERDINAND STEELE, Brooklyn, N. Y., assignor to AMERICAN STEAM AND WATER RECORDING COMPANY, same place. Application filed May 14, 1873.

One end of a rod is secured to a bridge in the pipe. The upper end is fastened to a flexible diaphragm, which closes the end of the pipe. The movement of said diaphragm, caused by the boiler pressure, is controlled by the expansion and contraction of the rod, which sounds an alarm.

Claim.—1. The diaphragm f and expansion rod or tube d, in combination with the tube e and alarm or whistle, substantially as set forth.

2. The diaphragm f, expansion rod or tube d, lever h, and an adjustment, p, in combination with the tube e and alarm of a low-water indicator, substantially as set forth.

3. The expansion-rod d and diaphragm f, in combination with the lever h, valve i, and alarm and steam and water tubes, substantially as and for the purposes set forth.

145,370.—Lock.—HERRMANN STEIN, New York, assignor to himself and HERMAN DALE, Brooklyn, N. Y. Application filed September 13, 1873.

The cap-plate is constructed of spring sheet metal, and is provided with teats or projections that engage and hold the tumbler when the bolt is in the locked or unlocked position.

Claim.—1. The combination of bolt A, having tumbler-recess b, pillar d, tumbler B, spring-plate D, and key C, composing the lock, arranged and operated substantially as and for the purpose described.

2. The spring-plate D, having teats or projections g and perforation for insertion of key, for the purpose described.

145,371.—Car-Coupling.—ALLEN STRAIN, Greenfield, Ohio. Application filed March 1, 1873.

The weight of the triangular plate presses upon the lever and prevents the escape of the link.

Claim.—1. The triangular plate D, with extension-arm K, pivoted at h, in connection with pin i, rope E, and lever C, applied to draw-bar A, to raise and lock the same, substantially as set forth.

2. The triangular gravity-plate D, arranged to press with its base upon lever C in a slotted draw-bar, A, as and for the purpose set forth.

145,372.—Railway-Rail Joint.—WOODARD THOMPSON, Gardiner, Me. Application filed October 29, 1873.

A lap-joint is formed by vertically cutting away the heads of the rails, and by securing to one end of the rail on opposite sides flat metal pieces, which project beyond the end of the rail, thereby forming a slot at the end of the rail. The adjacent rail is similarly cut away, and on one side is secured a short metal piece, as above, the length of which is the difference of the two which are secured on other rail. The end of the rail having the short piece is inserted in the slot of the other rail end. Expansion is allowed for by a slotted bar secured to one rail, a pin secured in end of other rail working in the slot.

Claim.—1. The plates b b c on the outside of and in combination with the lap-joint a^1 a^2, substantially as and for the purpose shown and described.

2. The slotted bar D, in combination with the rails A^1 A^2, plate b, and bolt c, as herein shown and described.

145,373.—Clay-Mill.—JAMES A. VAUGHN and HORACE B. CAMP, Cuyahoga Falls, HENRY E. MERRILL, Akron, Ohio, and CALVIN J. MERRILL, Alton, Ill., assignors to TURNER, PARKS & Co., Cuyahoga Falls, Ohio. Application filed May 3, 1873.

Grinding-wheels reciprocated longitudinally on shaft through auxiliary shaft and endless rack, operated by main driving-shaft.

Claim.—In combination with the main shaft A and endless rack G, the auxiliary shaft H for reciprocating the rack, the main and auxiliary shafts being so geared together that the grinding-wheels shall be reciprocated in the manner herein described.

145,374.—Carriage-Spring.—ROBERT WALKER, Harrisville, Ohio. Application filed October 18, 1873.

Claim.—1. In combination with an elliptic spring, the angular springs I I, substantially as and for the purposes described.

2. The flanged plates C C and springs I I combined, as and for the purposes described.

3. The springs J J, in combination with an elliptic spring, as and for the purposes described.

4. The pads K K on the springs J J, as and for the purposes set forth.

145,375.—Shaving-Conductor for Planing-Machines. WILLIAM WEAVER, Burlington, Vt. Application filed August 30, 1873.

The hood is swiveled, so that it may be turned aside to reach the cutters. Also, the chip-breaker is extended around the side cutter, having a recess in it to conduct the shavings into the hood.

Claim.—1. As an improvement in wood-working machinery, the combination of cylindrical planer A and side cutter B with the combined shaving-conductor C, turning in sleeve e^1 of casing E, substantially as and for the purpose described.

2. The chip-breaker D of the side cutters, being enlarged, and provided with tapering recess for carrying the chips to the conductor, as set forth.

145,376.—Machine for Cutting and Dressing Stone.—J. BURNS WEST and JOHN C. FISH, Genesco, N. Y., assignors of one-half their right to WILLIAM H. KELSEY, same place, and JOSEPH C. MCKIBBIN, Washington, D. C. Application filed December 3, 1873.

Two sets of cutters, geared upon right and left hand screws, travel toward the center of the stone.

Claim.—1. A stone-dressing machine having two separate and distinct sets of cutters, arranged to commence cutting at the edges or ends of the stone, and to terminate at or near the center thereof, said cutters having a simultaneous movement, the purpose being substantially such as is herein set forth.

2. The combination of the frame B C, cross-heads D D, chisel-stocks F F, chisels G G, holders H H, screws I I, and driving mechanism, the parts being constructed and arranged to operate substantially as and for the purpose set forth.

3. The bed K, when constructed and arranged to operate substantially as and for the purpose set forth.

145,377.—Liquid-Measure.—WILLIS L. WEVER and A. WALLACE JOHNSON, Plattsburg, N. Y. Application filed October 11, 1873.

A sliding central division carries on one side a shelf closely fitting the sides of the vessel. By adjusting the shelf to different heights the vessel may be used to measure different quantities of liquid.

Claim.—A measure arranged for measuring the whole or any subdivisional part thereof, produced by the unit-measure A having sliding central gate B, with closely-fitting subdivisional shelf C, constructed and operated substantially as and for the purposes described.

145,378.—Combined Drawing-Table and Desk.—JOHN A. WILKENS, Indianapolis, Ind. Application filed January 22, 1873.

When the desk is depressed the table-top slides over it and holds it in that position. When the top is drawn out the desk is elevated by the contraction of rubber cords or straps attached thereto.

Claim.—In a table-desk, the combination and arrangement of the rubber straps or cords G and the interior desk C with the sliding table-top I, closing over upon the case to hold the interior desk, as shown and described.

145,379.—Machine for Printing Oil-Cloth.—WILLIAM E. WORTH, San Francisco, Cal. Application filed October 25, 1873.

A vertically-moving press, for carrying the printing-block and pressing it on the cloth, is mounted in a frame carrying a platform for the operators, which frame shifts laterally on another frame, which may be moved forward and back over the printing-floor, whereon the cloth to be printed is laid; the principal frame—that is, the longitudinally-moving frame—being provided with pawl-and-ratchet mechanism for shifting it, and both frames being arrested, when desired, by stops, so that the prints will match.

Claim.—1. The combination of movable frames A M and press Q with a printing-floor, D, substantially as specified.

2. The press Q, platform V, lever U, and stud T, combined with the frame M, substantially as specified.

3. The pawls K and notches L, combined with the frame A, ways C, shaft E, racks G, pinions F, pawl and pawl-lever I J, and the wheel H, all substantially as specified.

4. The pawl O and adjustable stops P, combined with frames A and M, arranged and operating substantially as specified.

145,380.—Perforating-Rule for Printers.—CHAUNCEY W. AMES, New York, N. Y. Application filed August 9, 1872.

The perforator is moved obliquely on its bearings, when the impression is made, by means of the slides, and is held in position by the pawl until the impression is complete.

Claim.—1. The perforator A, provided with oblique bearings E F, and confined between the plates B B, in combination with slides G H for operating the perforator, substantially as and for the purpose described.

2. The locking-pawl L, in combination with the knife or perforator, substantially as described, and for the purposes set forth.

145,381.—Combined Bow Fastener and Guard for Ox-Yokes.—ESDIX N. BACON, Chelsea, Vt. Application filed November 15, 1873.

The long arms of the levers being thrust inward, they are retained in that position by the short arm of the lever C catching in a notch in the short arm of the lever D, so that the bow may be withdrawn.

Claim.—1. The bow-fastener, consisting of the holder F, notched lever D, lever C, and spring E, combined to operate substantially in the manner set forth and specified.

2. The holder F, extended as shown at y, to form a strengthener and guard, substantially in the manner described.

145,382.—Blowing-Machine.—JOHN G. BAKER, Philadelphia, Pa. Application filed November 24, 1873.

Two revolving slotted cylinders are placed in the lower part of the case to cut off communication between the inlet and outlet ports, and make two revolutions to one of the piston-cylinder. The slots permit the pistons or vanes to pass the cut-off cylinders. The three cylinders revolve nearly in contact with each other and the case, but do not touch.

Claim.—A blower in which are combined, within a chest, A, a cylinder, B, its vanes a a', and the slotted cylinders D and D', all substantially as described.

145,383.—Lathe-Chuck for Sleigh-Bells.—WILLIAM E. BARTON, East Hampton, Conn. Application filed May 15, 1873.

The chuck has a concave seat for the bell, and the latter has a screw-threaded hole, into which is screwed one end of a rod, the other end lying within the chuck, and secured there by a set-screw.

Claim.—The lathe-chuck herein described, formed with a countersink or concavity in its end and a central screw, the whole adapted to hold a spherical or other convex object with a threaded aperture, in the manner explained.

145,384.—Lubricating-Packing for Journals, Shafting, &c.—SAMUEL BAXENDALE, Boston, Mass. Application filed October 28, 1872.

Claim.—The combined lubricating-packing for shafts and journals, composed of a mixture of fibrous asbestus and wool-waste, substantially as described.

145,385.—Game Apparatus.—RUFUS E. BEAN, Franklin, N. H. Application filed June 17, 1873.

The ways upon which the ball is first placed are opened, at the pleasure of the operator, to direct the passage of the ball, if possible, into the holes numbered highest underneath.

Claim.—1. The bed A, provided with the cavities d d, arms B B, and rest b, constructed substantially in the manner described.

2. As a new and improved article of manufacture, the game apparatus described and shown.

145,386.—Machine for Making Endless Bands.—LEEDHAM BINNS, Oakenshaw, near Bradford, England. Application filed February 26, 1873.

A strand of suitable material is passed from a spool around the guide wheels or pulleys and through the opening in the center of the disks, and its end secured, the guide-wheels being then rotated until sufficient material is wound about them, in the form of a skein, to form a core for the band, it being then broken, and this end also secured. Covering-strands are then led and secured to the core, from spools on the disks, and the latter being rotated together or separately, and in opposite directions, the core is properly covered, the ends of the covering-strands being secured and hidden. The band is removed through the slots in the disks, wheels and boss.

Claim.—1. In a machine for the manufacture of endless bands, cords, or ropes, the combination of the guide wheels or pulleys b d, and disks j k, and parts carried thereby, or their equivalents, arranged and operated in manner substantially as shown and described.

2. The combination of the disks j k, wheels n o, with slots or openings therein, or with pieces capable of removal therefrom, and the boss c with a slot or opening therein, in the manner and for the purpose substantially as herein shown and described.

3. In a machine for the manufacture of endless bands, cords, &c., the open slotted tube or boss c, in combination with the open, slotted, spool-carrying disk, the latter acting to wind the thread carried by the spool about the material passing through the tube or boss, substantially as described.

145,387.—Steam-Trap.—JOSEPH BISHOP, Meriden, Conn., assignor to himself and CHARLES PARKER, same place. Application filed January 3, 1872.

An inner expansible tube with conical end fitting into a conical seat, which is made adjustable by a screw. The tube is inclosed in outer non-expansible tube.

Claim.—The herein-described steam-trap, consisting of the inner expanding tube B, of conical form at its lower end, and the outer non-expansive tube D, combined with the valve-seat I, corresponding to the lower end of the tube, and made adjustable relatively to the valve or open end of the tube, substantially as described.

145,388.—Ticket-Case.—LEONARD J. BLADES, Harrington, Del. Application filed May 29, 1873.

Drawers or slides are arranged above each other in inclined grooves. Their front edges have flanges, against which the tickets are held by a gravitating follower, and they are suspended vertically in front of the cases when required to be replenished.

Claim.—1. A series of ticket-holding slides, C, arranged in inclined ways in case A, and having stops E applied vertically, or nearly so, to the front edge of the partitions D, so as to leave a space, g, at the bottom, and the gravitating follower-blocks F, all combined as shown and described.

2. The combination of the ticket-holding slides C, having lugs or projections k at the rear side, with the case A, having grooves e and studs i combined, as shown and described, whereby the slides may be drawn forward and suspended vertically to be filled, as specified.

145,389.—Heel for Boots and Shoes.—LYMAN R. BLAKE, Brooklyn, N. Y., and ASA S. LIEBY, Lawrence, Mass. Application filed November 26, 1873.

Claim.—1. The boot or shoe sole, made of a block, a, encompassed by a band, b, which band has the lip or flange l, substantially as shown and described.

2. The block-encompassing leather band, having its ends united by the metal clasp f, whose hooks g h enter the channels i k, substantially as shown and described.

3. In combination with the block a and band b, the metal plate m interposed between the block a and lip l, substantially as shown and described.

4. A heel for boots and shoes, made substantially as shown and described.

145,390.—Thill-Coupling.—WILLIAM R. BOWMAN, Danville, Ky. Application filed July 2, 1873.

Claim.—The clutch C beveled on its inner faces from x to y, as shown, and provided with the slot b, in combination with the head G beveled from w to z, as shown, and connected to the thill-iron D, having shoulders i i, by the shank d, all as and for the purpose set forth.

145,391.—Ornamental Label for Hat-Linings.—THOMAS W. BRACHER, New York, N. Y. Application filed November 13, 1873.

Claim.—A label composed of a frame, A, of paper or other suitable material, and a center, B, of textile material, the two parts being combined and ornamented substantially in the manner herein shown and described.

145,392.—Sand-Paper Roller.—HENRY W. BRETT, Boston, Mass. Application filed November 12, 1873.

Claim.—1. A sand-paper roller constructed with the slit a, and with clamping-jaws B B^2, that are arranged and adapted for adjustment to draw the paper about the roller-body, substantially as herein described, and for the purpose specified.

2. The combination of the jaws B B^2, carrier-block C, and adjusting-bolts f with the cross-pieces D and roller A, having the slit a, arranged to operate substantially as and for the purpose specified.

145,393.—Wheel for Vehicles.—ALEXANDER BUCHHOLZ, Janesville, Wis. Application filed September 25, 1873.

Claim.—The notched and tenoned spokes B, fitted within the mortised wooden hub-core A, and forming, between their contiguous edges, the openings b', in combination with the flanged collars C and C', the latter of which is provided with the lugs c and c, substantially as and for the purpose specified.

145,394.—Steering Apparatus for Vessels.—CHARLES W. BUFFINGTON, Cleveland, Ohio. Application filed September 15, 1873.

Claim.—In a steering apparatus having a right and left hand screw, operated by rearing connected with the steering-wheel, constructed as herein described, the combination therewith and the nuts g g of the arms or rods h h and tiller-arm i, detachably connected, for the purpose of substituting a tiller-arm of different length, as set forth.

145,395.—Lubricator for Car-Wheels.—WILLIAM A. BULLARD, Kalamazoo, Mich. Application filed November 1, 1873.

Claim.—1. The oil-supply cup E, having a feed-hole, c, centrally through it, and secured to the outside of wheel A, in combination with inclined oil-passages a a in the wheel A, and the holes a' a' through the bushing C, and the recessed oil-supply washer G, applied to the axle B, substantially as described.

2. The washer D, keyed on axle B, and fitted in recesses in the wheel A, in combination with washer G, also keyed on axle B, and having a feed-cup, e e, feed-spaces h, and grooves g g, substantially as described.

145,396.—Corn-Planter.—JARVIS CASE, Springfield, Ohio. Application filed November 15, 1873.

The main frame is mounted upon two bearing-wheels, which serve as coverers. The seat is pivoted upon the axle-tree in such a manner as to be shifted into two positions, and secured in either. The furrow-openers (runners) are secured to the forward end of the frame by a self-adjusting coupling, and the rear end is adjustably connected to a pair of foot-levers, for lifting the runners entirely from the ground. The seed-boxes are mounted upon the runners in the usual manner, and the circular dropping-plate rotated upon its center by a reciprocating bar operated by hand. The ratchet-teeth are upon the face of the wheel-plate, and are acted upon each side by a gravitating-pawl, one of which acts at every stroke of the pawl-bar. A spring scraper-bar is attached loosely to the rear end of the frame, so that the free ends are held in contact with the face of the wheels.

Claim.—1. The rotating plate G, provided with the seed-cells d and the ratchet-teeth e on its face, in combination with the rods f, said parts being constructed and arranged to operate as and for the purpose set forth.

2. The disk G, provided with the teeth b on its edge, in combination with the arms h and i, arranged to operate as stops to limit the motion of the disks, as set forth.

3. The plates m, provided with vertical recesses or slots, in combination with the pin p, when applied as described, to form a flexible joint between the front and rear frames of a planter.

4. The levers D, pivoted to the bars A of the rear frame, and connected, by means of the chains r and adjusting-bolts q, to the

rear end of the front frame, for the purpose of elevating and adjusting the latter, all combined and operating as set forth.

5. The pivoted standard T, having the seat S made adjustable thereon, and provided with the adjustable wedges V and *z* and bars *y*, all constructed and arranged to operate substantially as described, whereby the seat can be moved forward or back, and kept in a horizontal position, as set forth.

6. In a corn-planter, the bar provided with the scrapers, in combination with the central detachable spring, all constructed and arranged to operate as set forth.

145,397.—Mop-Head.—CHARLES B. CLARK, Buffalo, N. Y. Application filed August 19, 1873.

The cross-head is formed with the two lateral arms diminishing smoothly and gradually from the center of shank portion. Also, the ends of the sliding clamping-wire are held in the collar by means of a rib, which is cast in the recess for receiving the wire, said rib entering a corresponding indentation in the wire.

Claim.—1. In a mop-head, the cross-head A, the arms of which are formed with a diminishing exterior surface from the center to the ends, substantially as and for the purpose herein set forth.

2. In a mop-head having a cross-head and a sliding clamping-wire, the projections *d d* on the collar C, in combination with the notches *s s* on the wire D, substantially as and for the purpose set forth.

145,398.—Machine for Bending Hoops.—EDGAR COAPMAN, Rochester, N. Y., assignor of one-half his right to B. H. CLARK, same place. Application filed June 20, 1873.

A circular former is so arranged as to hold hoops of different sizes in a proper position for securing their ends to each other.

Claim.—1. In combination with the pressing-roller G, the disk B, having slots *k k* and ways or grooves *w w*, and the expansible forming-wheel A, with its slides *l l* and the set-screws *i i*, all constructed and operating substantially as described.

2. The right-and-left screw C, the slides *l l*, the set-screws *i i*, and the slots *k k*, when combined with the forming-wheel A and disk B, in the manner and for the purpose specified.

145,399.—Ratchet-Wrench.—ISAAC C. COLBERT, Marysville, Ohio. Application filed July 19, 1873.

Claim.—1. The handle A, forming two jaws, B B', one of which is provided with ratchet-teeth, the barrel C, with its ratchet-collar *c*, and the spring *d*, in combination with a removable bush-thimble, D, substantially as and for the purposes specified.

2. The ratchet-barrel C, slotted at *d'*, and provided with a spring-catch, *d*, arranged to pass through said slot *d'*, to secure the bushing D, substantially as herein set forth.

145,400.—Can for Paints, &c.—JONAH R. COLE, New York, N. Y. Application filed July 18, 1873.

Claim.—The can A having a flange, C, of double thickness of material, and used in connection with the cover B having the raised portion or flange *a* and forming a solder-space, *c*, all constructed and arranged as and for the purpose specified.

145,401.—Door-Key.—JOHN COLLINS, Hohokus township, Bergen county, N. J., assignor to HOPKINS AND DICKINSON MANUFACTURING COMPANY. Application filed November 6, 1873.

Claim.—A key made in parts which can be adjusted to and rigidly secured in any desired relation, for the purpose of regulating the extent of protrusion of the handle to suit the thickness of the door, substantially as described.

145,402.—Mechanical Movement.—JOHN H. CRANSTON, Norwich, Conn., assignor to CHARLES POTTER, Jr., New York city. Application filed November 6, 1873.

On each side of the press is a lever turning on a fixed axis and connected to the bed by one end, and to a set of rollers by the middle, so that as the bed reciprocates the lever shall vibrate and the rollers shall be compelled to move to an extent equal to exactly half the motion of the bed.

Claim.—The lever G, connected to the bed B, and connected to the roller-frame C at a point equidistant between such connection and the center of motion *a*, so as to control the roller-frame C in all parts of the motion, substantially as herein specified.

145,403.—Explosive Compound.—CARL DITTMAR, Boston, Mass. Application filed August 30, 1873.

Claim.—1. The herein-described process of treatment of vegetable fiber, the same consisting in reducing the fiber to a pulp, then compressing the pulp into a sheet or other compact form, and then reducing said sheet to a granulated or powdered condition, and treating the same in this condition with an acid or acids for the purpose of rendering it explosive, substantially as described.

2. Vegetable fiber prepared with a solution of sugar, or mannite, or amylum, or inuline, or other substances, substantially as herein described, and rendered explosive by nitric acid.

145,404.—Sofa-Bed.—ERNEST N. DOHING, New York, N. Y. Application filed December 1, 1873.

The hinges on which the bed unfolds have slots for the screws to permit a forward as well as a pivotal movement, thus saving the upholstery between. The bedding does not extend the full length of the sofa, but has at each end, covering the deficiency, an arm-rest formed of a cushion and a box beneath. These latter, when the bed is unfolded, form a receptacle for a bolster, the cushions being at the other end.

Claim.—1. The seat-frame, composed of two parts, united together by a combined slide-and-hinge connection, substantially as and for the purposes shown and set forth.

2. The combination, in a sofa-bed, with the divided and hinged seat and bed-frame, of detachable arms, fitting down upon the end of the folded frame, and provided with front and side pieces, to cover and conceal the otherwise exposed portions of the frame sections, substantially as shown and set forth.

3. The detachable sofa-bed arm, made of two parts, the one a bolster portion, and the other a cushion portion, the same being constructed and adapted to be applied to the sofa-bed, substantially as herein shown and set forth.

4. The divided seat-frame, having the upper or movable portion upholstered to form a sofa-seat for a portion of its length, and not extending to the ends, in combination with the sectional arms, consisting, each, of a bolster and a cushion, fitted and applied to the unupholstered ends of said sofa-seat, substantially as shown and set forth.

145,405.—Fire-Extinguisher.—WEAR L. DRAKE, Evanston, Ill.—Case B. Application filed February 27, 1873.

The trunnions on which the extinguishers are mounted are hollow, and connect with a pipe extending nearly to the bottom of the tank.

Claim.—A tilting fire-extinguisher provided with one or more hollow trunnions, substantially as and for the purposes specified.

145,406.—Fire-Extinguisher.—WEAR L. DRAKE, Evanston, Ill.—Case C. Application filed February 27, 1873.

The generators are connected with the water-supply pipes of a building. Check-valves are placed in the pipes between the generator and the main, which close by the pressure of the gas when the extinguisher is discharged. Suitable outlets are arranged in the different rooms, and are provided with the necessary cocks or valves.

Claim.—A fire-extinguisher which discharges its contents by means of gas generated in the extinguisher, in combination with water-supply pipes provided with valves, arranged and operating substantially as specified.

145,407.—Lasting-Jack for Boots, &c.—JAMES C. DREW, Auburn, Me. Application filed October 2, 1873.

Jack specially adapted for finishing long-legged boots, with provision for ready attachment to a bench, and may be moved in any direction desirable while working upon the boot.

Claim.—1. The combination of the jack-spindle *o*, spindle-supporting arm *n*, and flanged coupler-plate *a*, substantially as and for the purposes described.

2. The combination of the disk-plate *e* and its hub *f*, and the bolt *h* and its disk-head *i*, and nut *k* for supporting the ring *m*, substantially as shown and described.

3. In combination with the coupler *a* and arm *n*, the stops *y* and *z* and projection *j* for sustaining the jack-spindle either in vertical or in horizontal position, substantially as described.

4. In combination with the disk-plate *e* and its hub *f*, and the bolt *h*, head *i*, and nut *k*, the elastic washer or spring *l* interposed between the head and hub, substantially as shown and described.

145,408.—Umbrella-Supporter.—WILLIAM A. DROWN, Jr., Philadelphia, Pa. Application filed May 31, 1873.

To afford ready connection and disconnection of the umbrella and its supporting-arm.

Claim.—1. The combination of an umbrella tip or stem, A, carrying a pivoted plate, B, with a supporting-arm, D, having an eye, *b*, through which the said stem and plate can be passed, as set forth.

2. The stem A, having a shoulder, *c*, and a jointed slotted plate, B, and adapted to a notched arm, D, substantially as specified.

145,409.—Reusing Alkaline Solutions from Treating Straw.—JAMES H. DUGAN, Bloomfield, N. J. Application filed October 26, 1872.

Combines the liquor drained from the straw with the wash-liquor; filters the mixture to remove foreign matter; re-enforces with caustic alkali; after which the solution can be used for treating a second quantity of straw.

Claim.—The combination, with a tank, A, of a draining-tank, B, and filtering-reservoir D, operating together, as and for the purpose specified.

145,410.—Flour-Sifter.—FREDERIC G. FORD, Philadelphia, Pa. Application filed June 20, 1873.

A follower is placed within the vessel and provided with a stem that passes through the cover. The follower removes the flour that adheres to the sides, while its stem indicates how much flour is in the vessel.

Claim.—The combination of the pail A, rotating sieve partition B, movable disk D, and stem E, extending through the center of the lid of the pail, all substantially as and for the purposes herein set forth.

145,411.—Screw.—JOHN FREARSON, Birmingham, England. Application filed October 22, 1873.

Claim.—A screw, provided in its head with one or more nicks of angular figure, or of a combined angular and V figure, the said nick or nicks being of greatest depth at the center of the head, and terminating within the edge of the head, as herein described and illustrated in Figs. 1, 2, 3, 4, 5, 6, and 7 of the accompanying drawing.

145,412.—Machine for Cutting Out and Stamping Up Sheet-Metal Boxes.—WILLIAM J. GORDON, Philadelphia, Pa. Application filed June 30, 1873.

The slides F and punch D have a definite throw, by virtue of their cams, and the cutter E is adjusted with relation to them, to suit different thicknesses of metal, by means of the nuts *e'* and *e''*.

Claim.—The construction and arrangement of the parts D, E, F, *e'*, and *e''*, in relation to the cams *e'''* and *f' f'*, and to the die C constructed as set forth, whereby the cutter or part E is caused to hold the separated blank firmly down upon the shoulder *c'* of the die C while the plunger or part D is forcing the said blank down through the central opening in the said die C, and afterward causing the formed-up blank to be released from the rising plunger or part D, that it may drop down into any suitable receiver, substantially as and for the purpose set forth and described hereinbefore.

145,413.—Vehicle.—CHRISTIAN GORMANN and JOSEPH B. THIEL, Union Hill, N. J. Application filed October 30, 1873.

Claim.—1. The sliding king-bolt I, connected with the body of the wagon by stays J, in combination with a horizontal steering-wheel, G, connected with the front axle, substantially as described, for the purpose specified.

2. The combination of the guide-plates E, having openings on each side of the axle, with the sliding brace-rods D, arranged in pairs on each side of the axle, all constructed substantially as and for the purpose specified.

145,414.—Shirt.—SOLOMON S. GRAY, Boston, Mass. Application filed September 22, 1873.

The neck-band is made adjustable in size, so as not to alter the position of the central collar-button.

Claim.—A shirt provided with two or more button-holes in each end of the neck binding or band, in combination with a movable stud or fastening for securing said band together, substantially as and for the purpose set forth.

145,415.—Flexible Play-Pipe for Hose.—JOHN GREACEN, Jr., New York, N. Y. Application filed June 20, 1873.

The flexible play-pipe has a ferrule or coupling attached, by means of an inner tube and flange, to prevent the liability of expanding the pipe from the coupling by the force of the water.

Claim.—A flexible play-pipe with a coupling thereto attached by means of an inner tube and flange, substantially in the manner and for the purpose described.

145,416.—Machine for Bending Wood.—HIRAM HANNA, Columbus, Ohio. Application filed May 27, 1873.

Carriage-thills are bent in one direction in a former, by which they are held, and removed to a clamping-table, where the points are bent in a transverse direction.

Claim.—1. The beveled opening *a*, formed in the hooked end of the heel-former B, substantially as and for the purpose described.

2. The heel-strap C, provided with the beveled hinged foot *c*, substantially as and for the purposes described.

3. The combination of the beveled opening *a*, formed in the hooked end of the heel-former B, with the heel-strap C, provided with the hinged bevel-foot *c*, substantially as and for the purpose described.

4. The notched bars *g g'* on the heel-strap C and former B, substantially as and for the purposes described.

5. The adjustable clamp G, in combination with the notch-bars *g g'* and heel-former B, arranged and operating substantially as and for the purposes set forth.

6. The combination of the heel-former B, hinged heel-strap C *c*, and eccentric clamp D E, &c., arranged and operating substantially as and for the purposes described.

7. The combination of the body-former K, provided with an attached point-strap, *m*, and clutch-head *m'*, point-former L, hinged latch *l'*, levered eccentric I', and rapid screw S, all arranged and operating substantially as and for the purposes set forth and described.

145,417.—Piano-Forte Action.—ALBERT K. HEBARD, Cambridge, Mass. Application filed September 13, 1873.

The spring exerts constant stress against the head of the flange-screw, thus lifting the under jaw always toward the hammer-butt pivot.

Claim.—The flat spring M, secured upon the upper surface of the flange A, its slotted free end embracing the set screw L, for drawing up the section D, to operate in connection with the hammer, substantially as described, for the purpose specified.

145,418.—Lounge.—ALOIS HEYER, Philadelphia, Pa. Application filed November 8, 1873.

The back is hinged to the arm-rests at each end, and the arm-rests are hinged to the body of the lounge, so that either arm-rest and the adjoining portion of the back may be elevated or depressed. The arm-rests are supported in a depressed position by a slide arranged beneath the body. A fastening is arranged on the back, so as to lock the back and arms in position when both rests are elevated.

Claim.—1. The end rests B, jointed to the body A, in combination with the back C, jointed to the end rests, substantially as and for the purpose set forth.

2. The slide E, arranged beneath the body A of the lounge, and operating, in combination with the end rests B, as set forth, and for the purpose described.

3. The catch D, in combination with the back C, end rests B, and body A of the lounge, substantially as and for the purpose set forth.

145,419.—Harvester-Dropper.—ANDREW J. HODGES, Peoria, Ill. Application filed August 27, 1873.

Claim.—The combination of bar G, having a hook or dog, *d*, the plate *g*, spring *e*, dropper F *i i i*, and cam *k*, substantially as and for the purpose set forth.

145,420.—Lithographic Press.—BERTHOLD HUBER, Boston, Mass. Application filed May 28, 1873.

When the bed-piece advances beyond a certain distance it causes a strain on the chain S, which, acting upon the belt-shifting device, throws the belt from one pulley to the other, and will cause the belt to cease acting on the cylinder F and to act on the return-rollers H^1 H^1. Now, by raising lever G^2 the cylinder F is removed from contact with the bed-piece B.

Claim.—In a press, the combination of the bed-piece B, the chain S^1, shifting device S R Q, and gears H F^1, operating substantially as described, and for the purpose set forth.

145,421.—Machine for Making Metallic Tubing.—JOHN HUGGINS, Birmingham, England. Application filed July 5, 1873.

Claim.—The combination of alternate pairs of vertical and horizontal forming or shaping and welding rolls and guides, for conducting the strip and partially-made tube to the successive pairs of rolls, said parts being constructed and arranged to operate as herein shown and described, so that the partially-formed tube shall be compressed into an elliptical form in cross-section, the longer axis of the ellipse being alternately vertical and horizontal, until said tube is made cylindrical in the last or finishing rolls.

145,422.—Bow-Pin for Ox-Yokes.—WILLIAM J. IVES, Meriden, Conn. Application filed September 16, 1873.

Claim.—As an article of manufacture, the bow-pin for ox-yokes, consisting of the pin A, having the flanged head B C upon one end, and the spring D on the other, substantially as set forth.

145,423.—Corn-Shocker.—GEORGE E. JOHNSON, Smith Valley, N. Y. Application filed July 19, 1873.

A jointed supporting-bar, with a transverse pin, has two legs inserted in a cross-bar, which turns on a pivot to facilitate removal.

Claim.—In a corn-jack, the pivoted table A with legs B, in combination with the bar C, hinged leg H, and removable pin D, substantially as and for the purpose specified.

145,424.—Heating-Stove.—JOSEPH JOHNSON, Spring City, Pa. Application filed November 8, 1873.

Slides working up and down on the inside of the external casing expose and conceal, at pleasure, the mica windows in the internal casing. Heating-chambers are made to project into this latter casing above the mica windows. These chambers communicate with external hot-air flue by means of the space between the outer and inner casings.

Claim.—1. The combination of the hood D, and the casing *a*, and a series of hollow projections extending from the said casing into the combustion-chamber of a base-burning stove, above the illuminating-doors, and forming air-heating chambers communicating with a hot-air flue, all as set forth, for the purpose specified.

2. A heating-stove in which slides F, admitting of being raised and lowered to expose or cover the mica doors B, are combined with hoods D, secured to the exterior of the stove above the said mica doors, all substantially as and for the purpose specified.

145,425.—Car-Axle Box.—JOSEPH G. JOHNSON, Elkton, assignor to THE LUBRICATING CAR-AXLE COMPANY, Baltimore, Md. Application filed August 30, 1873.

Claim.—The open-ended oiler-frame E, arranged to slide and be supported on shelves *d' d'* of axle-box and over an oil-reservoir, *d*, forming part of axle-box, as and for the purpose described.

145,426.—Device for Detaching Horses.—EDWARD P. JONES, Shell Mound, Miss. Application filed May 28, 1873.

Improvement on patent 96,703, of November 9, 1869. The inner ends of the levers are secured in place by means of guards.

Claim.—The whiffletree-bar A, projections or cleats B B, guards C C, and levers D D, the whole combined and arranged to operate substantially as described.

145,427.—Nut-Lock.—EDWARD KAYLOR, Pittsburg, Pa. Application filed May 13, 1873.

Claim.—The nut-locking device, consisting of the thin flat metallic plate, and the broad elastic washer, the latter, when displaced by the pressure of the nut, bending the former up around the edges of the nut, to prevent its turning, substantially as described.

145,428.—Car-Coupling.—JAMES KECK, Dwight, Ill. Application filed April 24, 1873.

To prevent accidental uncoupling, by the lateral swaying of the cars, the front of each head has a vertical slot formed in it, which embraces a rib formed on the shoulder of the opposing coupling. This will not prevent the cars uncoupling if one should jump the track.

Claim.—The draw-bar C, having a harpoon-head, with the vertical slot *f*, pin-hole *i*, and rib *g*, in combination with the spring

D, adapted to operate with a draw-head of similar construction, as set forth.

145,429.—Shirt-Protector.—GEORGE E. KING, New York, N. Y. Application filed November 25, 1873.

Claim.—The metallic strip B, when applied to a dress or dress-protector, substantially in the manner, and for the purpose set forth.

145,430.—Machine for Burnishing the Heels of Boots and Shoes.—RICHARD C. LAMBART, Quincy, assignor to TAPLEY HEEL-BURNISHING-MACHINE ASSOCIATION, Boston, Mass. Application filed November 1, 1873.

Claim.—1. The combination of a series of burnishers connected with a normally stationary plate or holder, and pressed inward by suitable springs, with a rotatively-reciprocating jack, which brings the whole length of curved heel-edge under the action of the burnishing mechanism.

2. In combination with the series of yielding burnishers and reciprocating jack, the support-plate *r*, made vertically adjustable, substantially as described.

3. In combination with the series of yielding burnishers and reciprocating jack, a carrier-plate, *v*, made adjustable horizontally, substantially as described.

4. In combination with a boot or shoe jacking mechanism, the burnisher or burnishers upon a stock or carrier arranged to reciprocate in a right line in a direction across the edges of the lifts, substantially as described.

145,431.—Egg-Carrier.—WILLIAM A. LAVERTY, Philadelphia, Pa. Application filed June 24, 1873.

The pockets are formed by a spring, which is bent in such a manner as to form four compartments, and held in position by notches in it, which fit slots on opposite sides of a strip, A.

Claim.—The strip A, slotted as described, and bent and interlaced to form four pockets, in combination with the straight strip B, substantially as and for the purposes herein set forth.

145,432.—Bung-Faucet.—GEORGE D. LEE, Brookhaven, N. Y., assignor of two-thirds his right to JOHN M. KING and HOLMES W. SWEEZY, same place. Application filed October 28, 1873.

A swinging hook, binding against the inside of the barrel, is pivoted to a rod, and is tightened by a nut working in a screw-threaded portion in said rod, forming a self-adjusting attachment to a faucet, by which it is readily secured to the barrel.

Claim.—1. The self-adjusting hook L, in combination with the screw-rod K and spout A, substantially as and for the purpose set forth.

2. In combination with the features above, the packing-rings C and O and screw-nut M, substantially as and for the purpose set forth.

145,433.—Disinfecting Compound.—JOHN W. LEE and JOHN W. DAVIS, Washington, D. C. Application filed December 3, 1873.

Claim.—A deodorizing and disinfecting solution, consisting of water, copperas, alcohol, either with or without saltpeter, substantially as described.

145,434.—Gate.—MONTGOMERY LOOMIS, Liberty Centre, Ohio. Application filed October 25, 1873.

A gate which can be opened or closed by sliding endwise or revolving around its post, having pivoted self-adjusting braces, which support the gate in a horizontal position when opening, preventing swagging; said braces pivoted to the swinging post through which the gate slides, their lower ends fitting in a horizontal groove of the bottom rail of the moving gate.

Claim.—The braces C C, pivoted to a block, D, on which the gate slides, in combination with the channeled gate-rail B and openings *g'*, substantially as described.

145,435.—Trunk.—HARVEY L. LOWMAN, Birmingham, Conn. Application filed November 6, 1873.

Claim.—A trunk or case of substantially rectangular form in its central, longitudinal, and transverse sections, contracted into a circular form at the ends, substantially as described.

145,436.—Apparatus for Sweating Hides or Skins.—WILLIAM M. MASON, Buffalo, N. Y. Application filed July 21, 1873.

Claim.—In an apparatus for sweating hides, the ventilator B with valve *a*, and the water-floor C with troughs *c c c*, when combined with the vault or apartment A, in the manner and for the purpose specified.

145,437.—Angle-Iron Cutter.—ARCHIBALD MCGUFFIE, Buffalo, N. Y. Application filed September 10, 1873.

The upper blade C is constructed with beveled edges *a a*, while the lower blade or knife D has a plane or straight cutting-edge, and is secured in position by the reversible wedges *b c*.

Claim.—1. The removable and reversible knife D, having a plane or straight cutting-edge, in combination with the vertical knife C, having the beveled cutting-edges *a a*, arranged substantially as described, for the purpose specified.

2. In an angle-iron-cutting machine, the reversed wedges *b c*, placed one each side of and in combination with the lower blade D, arranged and applied as and for the purpose specified.

145,438.—Lamp-Burner.—RUFUS S. MERRILL, Hyde Park, assignor to himself, WILLIAM B. MERRILL, and JOSHUA MERRILL, Boston, Mass. Application filed August 25, 1873.

The cone of a lamp-burner is corrugated close to and parallel with both sides of the flame-slot, in order to strengthen the sides sufficiently to prevent their indentation during use or transportation.

Claim.—An oblong-slotted sheet-metal deflector for lamp-burners, formed on top of the dome and on each side of the slot, with a rib or corrugation extending parallel with and near to the longer edges of said slot, as and for the purposes shown and set forth.

145,439.—Paint-Can and Device for Removing the Contents.—FREDERICK L. MILLER, Brooklyn, N. Y. Application filed October 24, 1873.

A diaphragm or packing of pasteboard is cut in the form of a cross-section of the can, with its diameter a little larger than that of the can, so as to afford a flange turned up all around. This diaphragm is then inserted and pushed up against the top of the can, the can reversed, and the bottom, with an opening in the center, is soldered on. The material is then filled in through the aperture in the bottom, which is finally closed in the usual manner.

Claim.—1. In combination with the supporting-shelf S, a rigid propelling-piston, N, constructed substantially as described, and for the purpose of expelling the contents of cans.

2. In a can for plastic material, a flexible independent packing, E, constructed substantially as described, for the purpose of combination with a rigid external piston, N.

3. The specific mechanism consisting of rack and pinion, constructed substantially as described, for the purpose of expelling the contents of cans containing plastic material.

4. An external piston, N, constructed substantially as described, for application to an internal independent flexible packing.

5. The combination consisting of the rigid external piston N, the flexible internal packing E, the support S, and the can C.

145,440.—Can for Paint, &c.—HERMAN MILLER, New York, N. Y. Application filed November 22, 1873.

Claim.—The combination, with a conical or tapering male valve-seat, *b*, at the mouth of the body of the can, and female valve *d* in the lid, of a screw-thread, *f*, spun or wrought in said body below the valve-seat *b*, and corresponding screw-thread *g* in the lid, substantially as shown and described.

145,441.—Ore-Separator.—HIRAM MINCT, Chicago, Ill. Application filed October 24, 1873.

The hopper is filled with the ore or similar matter, and the valve opened, allowing an upward current of water through the sieve, agitating the mass, and carrying the lighter particles over the flaring edge of the hopper.

Claim.—The tapering hopper I, in combination with the screen *b* and valve C, constructed and arranged for operation as and for the purpose specified.

145,442.—Gas-Cock.—EUGENE M. MORRIS, Baltimore, Md. Application filed November 17, 1873.

In a gas-cock the valve stem is prolonged beyond the seat, and operated by a spring. The prolongation is made hollow, and is perforated above and below the bottom of the valve-shell to permit of the passage of the water of condensation into the chamber provided as a receptacle therefor.

Claim.—The combination, with a cock-valve, B, subjacent chamber F, and drip chamber C, of the projecting tube *b*, provided with apertures b^1 b^2, one above and the other below the shell-bottom a^2, as and for the purpose specified.

145,443.—Seed-Drill.—ROBERT H. D. MORRISON, Winona, Minn., assignor of one-half his right to JESSIE TAGGART, same place. Application filed May 7, 1873.

Both the seed-cup and the corrugated feed-roller are made in halves, and slide upon each other, so as to enlarge or contract their capacity.

Claim.—The stationary sectional cup B, provided with a fluted feed-roller, C, in combination with the sliding sectional cup B', having the fluted feed-roller C', and with the lever A, pivoted to the stationary cup B, for operating the sliding cup and feed-roller, all being constructed and arranged for operation, substantially as specified.

145,444.—Brick-Machine.—LEMUEL PATTERSON, Parker City, Pa., assignor to himself and JAMES COOPER, same place. Application filed November 12, 1873.

A vibrating plate, operated by a lever, carrying pinions, which are adjustable, and gear into a reciprocating mold-rack, from which the formed bricks are ejected by plungers hung on a vertically-reciprocating frame operated by a rock-shaft.

Claim.—1. The reciprocating mold-rack G, gearing into the pinion *e*, and combined with the pinions *b* and *d*, which are hung upon the forward plate F, substantially as and for the purpose herein shown and described.

2. The vertically-movable frame L, carrying the plungers *f*, and connected with the short arms *g* of the jointed rock-shafts M M, substantially as herein specified.

3. The lever J, combined with the jointed frame I, vibrating plate F, and pinions *a*, *b*, *d*, and *e*, for operation on a brick-machine, substantially as herein shown and described.

145,445.—Welding Iron and Steel.—JOSEPH POPPING, New York, N. Y., assignor to himself and WILLIAM L. GODFREY, same place. Application filed November 21, 1873.

Claim.—1. For welding purposes, a compound composed of calcined borax, iron filings, and prussiate of potassa, in the proportions, and applied in the manner hereinbefore described.

2. The process, hereinbefore described, of welding iron and steel, viz., applying to the surfaces to be welded the compound hereinbefore named, joining the prepared surfaces of the metal together, heating them red-hot, and hammering or rolling the same.

145,446.—Car-Coupling.—HENRY H. POTTER, Sterlingville, N. Y. Application filed August 27, 1873.

The draw-head is made in two parts, the upper part having a horizontal movement, and the lower part a circular vertical motion, it being pivoted near its rear end. By means of a double crank-lever, operated from the platform, the said upper part is thrust forward, and the lower part downward, so that the pin, which is pivoted beneath the platform, is free to swing out and release the link. When the cars come together the parts are forced back to position. When one car jumps the track, the device is operated by a similar arrangement of levers operated by one of the rails of the track.

Claim.—1. The combination of the levers *i* or *l*, connecting-rod *n*, lever *o*, provided with the projections 1 2, with the two parts *c* and *a* of the draw-head, substantially as described.

2. The rods 6, cranked lever 7, arm 8, draw-head *a c*, and lever *o*, provided with the projections 1 2, all in combination, substantially as shown.

145,447.—Endless Driving-Belt.—J. FRANKLIN REIGART, Washington, D. C., assignor to himself and EHUD N. DARLING, same place. Application filed May 10, 1873.

Claim.—An endless driving-belt constructed of a flexible cord or wire, upon which are strung gum or other elastic balls, substantially as described.

145,448.—Composition for Fire-Brick, Stove-Linings, &c.—ERNST H. RICHTER, Taunton, Mass. Application filed August 21, 1873.

Composed of pulverized oyster-shell, sand, clay, and powdered zinc or iron.

Claim.—The composition herein described for stove-linings, fire-brick, retorts, &c., composed of the ingredients substantially as described.

145,449.—Apparatus for Granulating Zinc.—ERNST H. RICHTER, Taunton, Mass. Application filed August 21, 1873.

The conical hood keeps the contents of the kettle always in condition for removal and granulation, economizing fuel thereby.

Claim.—The suspended hood C, having a vent at the upper part, and placed above and combined with an apparatus for melting scrap zinc, substantially as and for the purpose described.

145,450.—Zinc-Furnace.—ERNST H. RICHTER and FRIEDRICH G. RICHTER, Taunton, Mass. Application filed August 21, 1873.

The center stack is supplied with air currents by means of inclined air-passages formed in the longitudinal partition of the retort-chamber; and, in place of the side stacks usually employed, horizontal draft-passages are formed on top of the furnace, and communicate with the central stack.

Claim.—1. The zinc-furnace carrying the central stack B on top of and in direct communication with central portion of the retort-chamber, and with the passages C C that extend to the four corners of the furnace, so that the stack will at once draw the gases from all parts of the furnace, as set forth.

2. A zinc-furnace provided with inclined air-passages *a a* in the central partition, when said air-passages are made to extend from the ends of the furnace to the central stack B, substantially as specified.

145,451.—Tobacco-Package.—GOLDSBOROUGH ROBINSON, Louisville, Ky. Application filed July 9, 1873.

Claim.—A wrapper consisting of a series of rows of corn-shuck leaves arranged spirally around a "cut tobacco" pocket, and each row binding upon a next adjacent one, in the manner set forth.

145,452.—Combined Lounge and Chair.—MARSHALL P. ROBINSON, Fayette county, Ky. Application filed September 30, 1873.

The hinged head-rest of an invalid-bedstead can be adjusted, by a curved arm and clamp-screw, to lean the contrary way, and thus form a chair at the head of the bed. There are also straps with eyelets and studs, and a foot-step between the two front legs.

Claim.—1. In combination with the lounge or frame *a*, the pivoted head-piece, which can be used as the head of the lounge or back of the chair, substantially as specified.

2. A combined chair and lounge, constructed of the body *a*, hinged part *c*, adjustable straps *b l*, curved arms *e*, eyes *g*, set-screws *t*, and hinged foot-board *u*, the parts being arranged for operation substantially as shown and described.

145,453.—Pipe-Organ Valve.—WILLIAM SCHULKE, Hamilton, Ohio. Application filed June 20, 1873.

The wind-chest valves are pivoted in the base-board of the chest, and the tails of the valves connected by a threaded wire with adjustable nuts thereon, the valves being thus accurately fitted to their seats. The spring holding said wire and the connected valves in place is itself adjustable by set screws to increase its tension when desired.

Claim.—1. In combination with the pivoted valve-levers G, the threaded connecting-rod H and nuts *h*, substantially as and for the purpose specified.

2. In combination with the connecting-rod H and its valves, the lever I, the spring L, the strip M, and the set-screw N, substantially as and for the purpose shown.

145,454.—Manufacture of Glue.—BENJAMIN F. SHAW, Cambridge, Mass. Application filed June 6, 1873.

Consists in forming upon that part of the surface of the pan a coating that is complementary to the skin or coating which is formed by natural tendency at the surface exposed to the air, and by this means inclosing completely within a case, film, or sack the softer and sticky portion of the mass so that it may be removed and handled with facility.

Claim.—The formation of a coating, film, pellicle, or crust for the unexposed surface of gelatine or glue in the process of manufacture and desiccation, for the purpose mentioned.

145,455.—Ore-Washer.—REUBEN SOLLIDAY, Allentown, Pa. Application filed October 24, 1873.

Improvement upon Letters Patent No. 138,948, granted May 13, 1873.

Claim.—The means employed for locking the blades B in position within the groove A' of the base A, consisting of the key C, fitted to or within the openings *a'* and notch *b'*, substantially as specified.

145,456.—Railroad Switch-Signal.—CHARLES W. SPAYD, Wilkesbarre, Pa. Application filed January 10, 1873.

A switch-signal shaft is provided with a pinion and a lug. The former gears with two teeth on the cap of the switch-stand so as to turn the shaft barely half round and display the signal required. The lug at the same time turns in a semicircular recess, and then, coming between the split parts of the cap, locks the shaft, preventing further rotation.

Claim.—1. The key *r*, in combination with the two-part switch-lever and the signal-carrying rod pivoted between them, and provided with the arm *f*, moving between the sides of the cap of the switch-stand, as shown and described, whereby said rod may be locked, as specified.

2. In combination with cap E of the stand, provided with teeth *d d* and recess *e*, the rod or lever A, its rigid arm *f*, and pinion *c* keyed thereto, as shown and described.

145,457.—Water-Heater.—ARCHIBALD STENCE, Montreal, Canada, assignor of one-half his right to PETER H. FERGUSON, same place. Application filed October 24, 1873.

The main double-cone boiler inclosses the fire-grate near its base, and the products of combustion pass up through an internal system of water-pipes connecting the opposite sides of the main boiler and out through an opening in the top into a supplementary double-shell boiler. In this boiler a central water-space compels the heated air to traverse its length to reach the exit-flue.

Claim.—1. A boiler constructed of outer shell *a*, with sediment-chamber *d d*, plugs *f f*, inner shell *b*, with flange *e e*, as and for the purposes set forth and described.

2. Flanged pipes *h h*, branching from the shoulder, connecting the top or head, composed of outer shell *j j*, flanges *k k*, branches *l l*, pipe *m*, in combination with inner shell *n*, heads *o o*, stoppers *t t*, space *p*, smoke and heat passages *q* and *r*, plate *s*, double smoke-flue *i*, as and for the purposes fully described and set forth.

3. The hollow water-cone *u*, with openings *w*, annular water-space *x*, in combination with vertical tubes *y*, lower annular water-space *z*, elbow-pipe 2, ring 3, cross-pipe 4, vertical pipe 5, movable plugs 6 6, as and for the purposes fully described and set forth.

145,458.—Subaqueous Gas-Stove.—SAMUEL H. STARR, Philadelphia, Pa. Application filed September 20, 1873.

A stove to be sunken in the liquid to be heated has an air-tube opening into an air-chamber, which underlies the entire base of the stove, and has orifices in its top for emission of air to the gas-jets. A gas-tube follows the inside of the air-tube and air-chamber; fits an opening in the top of the air-chamber, and so conducts gas into a gas-chamber, from whose dome-shaped cover gas is emitted in jets and is fed by air from the underlying air-chamber. Flame is applied to the top of the smoke-pipe, whence it is borne to the gas-jets in the body of the stove.

Claim.—The combination, in a subaqueous gas-stove, of the convex disks D and K, the plate *m*, the base-plate *s*, and the pipes A and B, substantially as described, and for the purpose set forth.

145,459.—Plastering-Machine.—GUSTAVUS STEVENS and JAMES H. WATSON, Tawas City, Mich. Application filed August 13, 1873.

The mouth-piece, carrying the trowel-plate, is adjusted by means of the pivoted lever *i*, slotted at the short arm and set by an adjusting-screw. The mortar is furnished to the trowel through the mouth-piece by a piston sliding within the reservoir, and fed forward as the machine is drawn over the surface by a rack-bar gearing into a pinion, and train moved by the bearing-wheels of

the machine, the train being so calculated as to give the proper rate of delivery.

Claim.—1. The trowel G, attached to the adjustable and pivoted levers *l l*, as and for the purpose specified.

2. In combination with the trowel G, the trowel *i*, the trough-shaped mouth C, box A, and plunger D, as and for the purpose specified.

3. The box A, the plunger D, the mouth C, the rack-bar E, the cog-wheels *d* and *e* with the pinion *a*, the trowels G and *i*, the lever-arms *l l* combined with wheels F F and H H and handles I I, substantially as described.

145,460.—Cleansing Sugar from Molasses, &c.—AUGUSTUS H. TAIT, Jersey City, N. J. Application filed December 6, 1873.

Claim.—The process of cleansing or purging sugars by means of a solution of grape-sugar or glucose, in the manner substantially as described.

145,461.—Manufacture of Iron.—WILLIAM J. TAYLOR, High Bridge, N. J.—Case A. Application filed December 5, 1873.

Claim.—1. The method herein described of making cast-iron from oxides of iron by reducing magnetic iron ores to a fine or powdered condition, separating the iron oxides therefrom by magnetic influence, and preparing and uniting the same for use in the furnace, whereby the products thereof are controlled by controlling the character of the material prior to its use in the furnace, substantially as herein described.

2. The consolidation of purified fine magnetic oxides of iron with lime, or its equivalent, in the manufacture of cast-iron, in the manner and for the purposes substantially as herein described.

3. A composite material of purified fine magnetic oxides of iron and lime, prepared as described, to furnish both the material and its flux in the same combination.

4. As a new article of commerce and trade, a composite material for the production of iron, having the character of fine purified oxides of iron, compounded with lime or its equivalent.

145,462.—Manufacture of Iron.—WILLIAM J. TAYLOR, High Bridge, N. J.—Case B. Application filed December 5, 1873.

Claim.—1. A composite material for the manufacture of cast-iron, consisting of the combination of fine magnetic purified oxides of iron with carbon and lime for a fluxing material necessary for smelting, substantially as herein described.

2. The composite material herein described, as a new article of commerce and trade, in the manufacture of cast-iron.

145,463.—Horseshoe.—GEORGE H. TODD, Montgomery, Ala. Application filed September 27, 1873.

An elastic substance is interposed between the plates. The lower plate is provided with projections at the heel ends and toe to protect and assist in keeping the elastic substance in place.

Claim.—The plate A, with recess *d*, the plate B, with lip *c*, and curved or bent heel *e*, in combination with the elastic substance C, substantially as and for the purpose described.

145,464.—Machine for Cutting Paper.—GEORGE A. WALKER, Boston, Mass. Application filed November 9, 1871.

The paper-gage is adjusted by a cord and pulley. The bed and paper-clamp are raised in contact with the knife by eccentrics, moving in plates fixed to the table, operated by worm-gear and pinions.

Claim.—1. The special combination above described of the bar B with the eccentrics I I and the uprights A A, when arranged relatively to each other as specified, and so that the slots in the uprights shall serve as guides not only for the bar B, but also for the eccentrics.

2. The combination of the gage J, cord K, and double wheel L, when constructed and operating substantially as described.

145,465.—Repairing Railroad-Tracks.—BEALE A. WARFIELD, Howard county, and WALTER F. ELMER, Baltimore, Md. Application filed April 7, 1873.

A portable substitute rail carried on the train for use in case of a breach in the track. The portable rail is of a proper configuration to fit the main rails by lapping, and in case of a break the adjoining portions of the broken rail are sprung outward and the substitute rail lapped and fitted into the breach so made. In case of removal of a portion of the broken track, a number of the substitute rails can be used.

Claim.—1. A portable substitute rail, adapt to butt against a sound rail and lap a broken one sprung off to receive it, the said substitute rail being beveled and recessed as may be required to cause it to fit against the said broken and sprung rail, substantially as set forth.

2. The portable substitute rail or rails beveled and recessed or otherwise adapted to lap the sides of two extremities of a broken rail, or two broken rails, substantially as and for the purpose herein specified.

145,466.—Vapor-Engine.—WILLIAM WELLS, Salem, Mass. Application filed October 29, 1873.

A chamber incases the piston-rod, substantially through its whole length, preventing escape of the gas used as motive-power, and connects with the cylinder by a pipe to return the gas.

Claim.—The chamber G, arranged about the piston-rod and connected with the piston-cylinder of a vapor-engine, substantially as and for the purpose described.

145,467.—Journal and Bearing.—JOSEPH WHITAKER, Woonsocket, R. I., assignor to SIMEON S. COOK, same place. Application filed November 19, 1873.

A yielding supply-tube and lubricating-pad, to insure close contact of the pad with the journal, and thereby secure as perfect a vacuum as possible.

Claim.—1. In combination with a journal-box, having an upper and lower bearing, an independent self-adjusting oil-tube, working in an aperture in the lower bearing, and held in contact with the shaft by a spring, substantially as described, for the purpose specified.

2. The bearing B, having the aperture C, in combination with the tube E, having the concave head D, and spiral spring G, substantially as described, for the purpose specified.

145,468.—Car-Starter.—AMOS WHITTEMORE, Cambridgeport, Mass. Application filed October 16, 1873.

Claim.—1. The starting-eccentrics D on axle D′, combined with right and left springs S S, loose chain-drum H, chain T, and wheels G G^3 on a frame, F, substantially as and for the purposes described.

2. The lifting toggle-frame E E′, connected by a chain, *p*, to the brake-lever I, for the purpose of applying the brakes when the car has been lifted to its full height, all combined as and for the purpose described.

3. The chain R, connected to the shaft of the winding-up wheel G and also to the toggle-frame E E′, in combination with the chain T for operating the eccentrics D D′, levers L L′ M M, rod *m*, arm A, and the eccentric shaft of clamping-wheel G^2, substantially as and for the purposes described.

145,469.—Peg-Cutter.—AMOS WHITTEMORE, Cambridgeport, Mass. Application filed October 16, 1873.

A guard-plate is secured to an overhanging frame, so as to press upon the outer sole of the boot or shoe while the pegs are being cut.

Claim.—1. The rotary cutter B′, arranged at the upper end of a double-inclined rigid stock, A, and operated by means of spurred teeth *b*, and double spurs *b′*, and a pinion, *g*, as and for the purposes described.

2. The guide *k* on a pressure-plate, K, in combination with the rotary cutter B′, substantially as and for the purposes described.

3. In a machine for cutting pegs from boots and shoes, a plate or device, K, arranged and operated to press upon the outer surface of the sole of the boot or shoe and hold the same down upon the peg-cutters, substantially as described.

145,470.—Car-Brake.—JOHN G. WIGGIN, Moultonville, N. H. Application filed June 30, 1873.

The chain attached to the brake-lever is carried around the car-axle and fastened to a turn-shaft, which is revolved by a hand-wheel and pinions. The chain being tightly drawn upon the axle, sufficient friction is produced by the revolution of the latter to operate the brake.

Claim.—1. The combination of the chain D with the axle E and the turning shaft C, substantially as and for the purpose specified.

2. A system of car-brakes, composed essentially of the self-coupling shafts C C, brake-chains D D, car-axles E, and hand-wheels K K, all combined to operate substantially as and for the purpose set forth.

145,471.—Furnace for Reducing Iron Ores.—JOEL WILSON, Dover, N. J. Application filed June 10, 1873.

Improvements on Letters Patent No. 128,993, July 16, 1872. The flue for entrance of products of combustion is placed beneath the exit-flue, so as to obtain discharge room for two more retorts. Flues beneath the retorts conduct a portion of products of combustion directly to the outer annular chamber, and also serve to heat the retort bottom. The external conduits enable communication to be made with the descending-flues without weakening the retorts.

Claim.—1. The flue F, located below the annular collecting-chamber I, and communicating with the internal chamber E, which is surrounded by retorts and flues, substantially as described.

2. The flue-passages *n n* under the retorts B, leading from chamber E into the angular space *b*, surrounding the retorts, substantially as described.

3. The external conduits *c*, forming communications between the chamber E and the upper ends of the descending flues C, substantially as described.

145,472.—Process of Transferring Lithographic Prints onto Glass, &c.—OTTO P. WOLFF, Cincinnati, Ohio, assignor to STROBRIDGE & CO., same place. Application filed June 6, 1873.

Claim.—In the before-described process of preparing and transferring lithographic prints onto glass, &c., the employment of a transparent solution of white lac, substantially as described, and for the purposes specified.

145,473.—Horse-Power.—DANIEL WOODBURY, Rochester, N. Y. Application filed November 1, 1873.

The leveling-frame is pivoted to the under side of the main frame, and the latter is connected with the standard and stay-bar for adjusting either the main or leveling frame to the proper position. The vertical and lateral adjustment of the bull-wheel is accomplished by means of the slide upon the end of the arms over the covering of the bull-wheel.

Claim.—1. In a mounted horse-power, such as shown and described, the leveling-frame D, windlass S, outrigs J L, slides H H, and brake Q, combined with the main frame A, to operate in the manner and for the purpose specified.

2. The combination of the main frame A, short leveling-frame D, and the pivots *b*, the said pivots being secured upon the frame A, close to the axle, in such a manner that the axle projects beyond said pivots, to receive the wheels, substantially as shown and described.

3. In combination with the main frame A, the adjustable standard M and adjustable share or stay-bar N, to be employed conjointly in the raising and lowering of the main frame or the leveling-frame, as specified.

4. In combination with the standard M and share N, the supporting-arch, consisting of the bars *x x* and the plates *w z*, as and for the purpose specified.

5. In combination with the leveling-frame D, the reach O, provided with the lugs b^3 b^3 and cross-piece c^3, and connected by the pin d^3, as and for the purpose specified.

6. In combination with the bull-wheel F, the slides H, when provided with the forks *k*, and having vertical lips w^3, which stand reversely to the motion, and made adjustable by the keys *l*, as shown and described.

7. In combination with the brace-arm K and bearing *o*, the angular or rounded bearing end of said arm and the sliding shank *p*, provided with the hook *q* for engaging with the eye *r*, as and for the purpose specified.

8. In combination with the spur-gear 2, the brake Q and spring s^3, operating as described.

9. In combination with the outrigs J L, the bearings *s s* at the front and rear of the main frame, as shown and described, and for the purpose specified.

10. The combination of the block W, standard X, and segment y^3 of the jack, the said block and standard being pivoted to turn at right angles to each other, as specified.

11. In combination with the pivoted standard X and segment y^3, the perforated gage-plate b^3, as and for the purpose specified.

12. In combination with the pulley Y, the adjusting-ring Z and its guide-pulley a^3, as and for the purpose specified.

13. In combination with the windlass S, the hanger A^3, pulley n^3, and the stay-cord c^3, as and for the purpose specified.

145,474.—Draft-Equalizer.—OWEN N. COLLINS and PETER B. STILES, Cedar Rapids, Iowa. Application filed November 20, 1873.

Claim.—1. The combination of the bow-yokes C with the plates A of the harness, as and for the purpose described.

2. The combination of yokes C with the equalizing draft-bar D, as and for the purpose described.

3. The projecting rest *b*, provided with holes *c*, as and for the purpose described.

4. The combination of the projecting rest *b* and clevis *c*, as described.

REISSUE PATENTS.

5,677.—Mode of Constructing Wells.—ASAHEL CURTIS, Bastrop, La.—Patent No. 139,947, dated June 17, 1873. Application filed October 18, 1873.

An additional temporary casing-tube is employed above the foundation-tube, which remains at the surface, and serves as a guide by which to lay the bricks evenly and perpendicularly.

Claim.—The casing-tube B, applied above the sand-penetrating box A, so as to enable the bricks to be laid evenly, perpendicularly, and more economically thereon, forming thus the well in the manner and for the purpose described.

5,678.—Sofa-Bedstead.—JOSEPH B. HARLOW, Portland, Me. Patent No. 135,643, dated February 11, 1873. Application filed September 10, 1873.

A sofa and folding leaf have each a hinged head-rest, which are also hinged to one another; both susceptible of angular adjustment by a catch on the former, which, to permit the unfolding, is released to allow the rests to fall into a horizontal position, when the catch again adjusts them. The front of the leaf is supported by pivoted legs; brought from the horizontal to the vertical by the horizontal reciprocation of a bar acting on segmental racks on the legs.

Claim.—1. The combination, with the fixed or immovable frame *n n*, of the movable frame *e e′*, hinged to the front *d* by the hinges *e*, and carrying hinged to it the part *b b′* by the hinges *c c*, the said part *b b′* operating, in the folding and unfolding of the lounge, substantially as herein described.

2. The combination, in a sofa-bedstead, of the head-rest *r* and *b*, hinges *c c* and *c′ c′*, and ratchet *g*, provided with the cord *q*, with the frames *e* and *e′*, operating in the manner set forth.

3. The combination of the rail *e*, bar *w*, having the slots *s s*, and racks *k k*, with the supporters *i i*, provided with the gears *j j*, as set forth.

5,679.—Ball-and-Socket Joint.—MILTON W. ST. JOHN, Leonardsville, N. Y.—Patent No. 79,408, dated June 30, 1868; antedated June 12, 1863. Application filed November 15, 1873.

The socket in the piece D is made much deeper than the diameter of the ball, and there is a notch in the side a little wider than the neck, which is connected to the ball, to allow sufficient play for the vibration of the neck. On the upper side of the ball is a metallic piece, C, concave on its under side and smooth to match the ball, and flat on its upper side, on which is placed a piece of rubber, and the whole is secured under a cap, which screws over the piece D.

Claim.—1. The deep socket-piece D, having a notch, *d*, in the side, in combination with the concave piece C, matched within the upper portion thereof, and with the ball E and neck *e*, as herein specified.

2. The adjustable cap F, in combination with the concave piece C, socket-piece D, notch *d*, and ball and neck E *e*, as herein specified.

3. The shoulders *c c* on the concave piece C, in combination with the notch *d* in the deep socket-piece D, and with ball and neck, and with a suitable cover or holding means, F, as herein specified.

4. A spring or elastic piece mounted over the concave piece C, in combination with the ball E, neck *e*, and deep-notched socket-piece D *d*, as herein specified.

5. The combination of the deep socket-piece D, ball E, concave piece C, rubber G, and cap F, when connected to the parts substantially in the manner and for the purposes specified.

5,680.—Mold for Rubber Billiard-Cushions.—MATHEW DELANEY, New York, N. Y.—Patent No. 116,819, dated July 11, 1871.—Division A. Application filed November 11, 1873.

The mold for forming the billiard-cushion having a strained cord or core held in it. The molded cushion is thus provided with a true fine hole for the after insertion of the spring-wire, also held under tension therein.

Claim.—In combination with the mold, a core firmly held under tension or in a strained condition, substantially as and for the purpose described.

5,681.—Billiard-Cushion.—MATHEW DELANEY, New York, N. Y.—Patent No. 116,819, dated July 11, 1871.—Division B. Application filed November 11, 1873.

Claim.—A rubber cushion-body molded into a solid mass, and provided with a hole adapted to serve as a pocket for the reception of a wire to act as an auxiliary spring, formed parallel with the face of the cushion, and at the proper height relatively to the line of impact of the balls, substantially as described.

5,682.—Water-Wheel.—JOSEPH TANEY, Bangor, Me.—Patent No. 143,040, dated September 23, 1873. Application filed December 1, 1873.

The water first acts upon the wheel by impact upon the buckets, and then, as it fills the wheel and makes a pressure upon its rim, the curved vents above and below give vent to this pressure, and free the wheel from the reaction of the water in the scroll-passage.

Claim.—1. A water-wheel having the central discharges *i* and the discharges *c* through the base or crown plate, substantially as set forth.

2. A water-wheel having the central discharges *i* and the curved vents *c* through its crown and base plates, substantially as specified.

INDEX OF INVENTIONS PATENTED DECEMBER 9, 1873.

	Class No.	Whole No.
Alarm, burglar, H. L. Brown	24	145,332
Alkaline solutions from treating straw, re-using, J. H. Dugan	35	145,409
Axle, carriage, S. S. Cook	31	145,280
Bale tie, cotton, G. N. Beard	7	145,273
Bale ties, device for forming, J. McClean	7	145,357
Bands, machine for making endless, L. Binns	81	145,396
Bed, sofa, E. N. Doring	62	145,404
Bedstead, E. Morris	62	145,305
Bedstead, sofa, J. B. Harlow, (reissue)	62	5,678
Bee hive, L. Adams	9	145,384
Belt, endless driving, J. F. Reigart	81	145,447
Billiard cushion, M. Delaney, (reissue)	143	5,681
Billiard cushions, mold for rubber, M. Delaney, (reissue)	143	5,680
Blowing machine, J. G. Baker	12	145,382
Boiler, wash, W. W. Turtelot	136	145,318
Boot and shoe heel, Blake and Libby	16	145,389
Boot and shoe heels, machine for burnishing, R. C. Lambert	16	145,430
Boots, &c., lasting jack for, J. C. Drew	16	145,407
Bottle stand, wire, G. D. Dudley	88	145,284
Boxes, machine for cutting out and stamping up sheet metal, W. J. Gordon	136	145,412
Bracket, metallic, A. D. Judd	62	145,351
Brick machine, J. M. Mitchell	50	145,356
Brick machine, L. Patterson	50	145,444
Bridles, machine for punching, splitting, and creasing, J. B. Gathright	72	145,292
Brush, fountain, R. Lapham	146	145,301

Car coupling, A. Strain	122	145,371
Car, railway, C. W. Saladee	121	145,365
Car, railway, C. W. Saladee	121	145,366
Car starter, A. Whittemore	122	145,468
Car wheel lubricator, W. A. Bullard	124	145,395
Carriage, child's, J. N. Haselip	31	145,298
Carriage curtain fastening, F. Baumgartner	31	145,328
Carriage spring, J. Bullock	31	145,333
Carriage spring, R. Walker	31	145,374
Cart loading scoop, A. Vreeland	51	145,320
Churn dasher, G. W. Barker	45	145,272
Cigar box, H. Fowler	160	145,290
Cook, gas, E. M. Morris	64	145,442
Coop, folding, E. P. Lawrence	116	145,302
Corn sheller, J. Marshall	59	145,356
Corn shocker, G. E. Johnson	75	145,423
Corpse preserver, C. O. Peck	35	145,307
Cotton openers, feed regulator for, R. Kitson	28	145,300
Crimping machine, L. P. Lum	16	145,303
Cultivator, wheel, G. Bradley	43	145,331
Curtain fixture, C. C. Moore	62	145,359
Cutter, angle iron, H. McGuffie	119	145,437
Dental filling, C. E. Blake	46	145,275
Dental purposes, metallic foil for, C. E. Blake	46	145,274
Disinfecting compound, Lee and Davis	35	145,433
Drill, rock, W. Roberts, Jr	124	145,364
Drill, seed, R. H. D. Morrison	133	145,443
Egg carrier, W. A. Laverty	116	145,431
Engine, rotary steam, W. F. Moody	150	145,304
Engine, steam and air, F. J. Crouch	2	145,281
Engine, vapor, W. Wells	2	145,466
Equalizer, draft, Collins and Stiles	31	145,474
Explosive compound, C. Dittmar	35	145,403
Eye and lung protector, G. A. Crofatt	156	145,337
Faucet, bung, G. D. Lee	167	145,432
Filter for wine, C. W. Farciot	167	145,288
Fire brick, stove linings, &c., composition for, E. H. Richter	154	145,448
Fire extinguisher, W. L. Drake	35	145,405
Fire extinguisher, W. L. Drake	35	145,406
Furnace for reducing iron ores, J. Wilson	85	145,471
Furnace, zinc, E. H. and F. G. Richter	99	145,450
Furnaces, crucibles, &c., composition for lining, A. E. Bates	35	145,326
Game apparatus, R. E. Bean	143	145,385
Game board, A. F. R. Arndt	143	145,271
Gas, manufacture of water, E. J. Jerzmanowski	66	145,350
Gate, M. Loomis	52	145,434
Gate fastener, J. H. Nichols	93	145,362
Generator, steam, E. Goddard	148	145,293
Glue, manufacture of, B. F. Shaw	26	145,454
Grain and malt cleaner and crusher, N. Thielen	57	145,314
Grate, stove, G. R. Moore	154	145,360
Harness loop, F. Hickman	73	145,299
Harvester dropper, A. J. Hodges	74	145,419
Hat linings, ornamental label for, T. W. Bracher	76	145,391
Hay loader, C. E. Warner	77	145,321
Heater, water, A. Spence	147	145,457
Hides or skins, apparatus for sweating, W. M. Mason	92	145,436
Hinge, stop, G. C. Thomas	24	145,315
Hoop bending machine, E. Coapman	40	145,398
Horse power, D. Woodbury	159	145,473
Horses, device for detaching, E. P. Jones	31	145,426
Horseshoe, G. H. Todd	60	145,463
Horseshoe nails, manufacture of, H. D. Cowles	60	145,336
Hose, flexible play pipe for, J. Greacen, Jr	167	145,415
Hydrant, W. H. Graham	167	145,294
Ice creeper, R. H. Earle	16	145,340
Indicator, low water, F. Steele	148	145,369
Ingot mold, N. Churchman	33	145,278
Inkstand, A. D. Judd	146	145,352
Iron and steel, welding, J. Popping	85	145,445
Iron, manufacture of, W. J. Taylor	85	145,461
Iron, manufacture of, W. J. Taylor	85	145,462
Joint, ball and socket, M. W. St. John, (reissue)	67	5,679
Journal and bearing, J. Whitaker	87	145,467
Journals, shafting, &c., lubricating packing for, S. Barendale	87	145,384
Key, door, J. Collins	93	145,401
Knife, shoe, A. J. Hall	16	145,295
Latch, gate, G. N. Sharp	93	145,368
Lathe chuck for sleigh bells, W. E. Barton	100	145,383
Liquid measure, Wever and Johnson	132	145,377
Lithographic press, B. Huber	117	145,420
Lithographic prints onto glass, &c., process for transferring, O. P. Wolf	54	145,472
Lock, H. Stein	93	145,370
Loom, S. T. Thomas	95	145,316
Lounge, A. Heyer	62	145,418
Lounge and chair combined, M. P. Robinson	62	145,452
Lubricator for car wheels, W. A. Bullard	122	145,395
Marble, and veining the same, manufacturing artificial, F. H. Hall	153	145,345
Meat holder, S. Beissel	25	145,329
Mechanical movement, J. S. Cranston	67	145,402
Medical compound, W. F. Staten	98	145,313
Metals in liquid state, apparatus for compressing cast, H. W. Barnum	12	145,325
Mill, clay, Vaughn, Camp, and Merrill	20	145,373
Mitering machine, C. Loetscher	29	145,354
Mop head, C. B. Clark	62	145,397
Muff stand, L. Bergtold	62	145,330
Nut lock, E. Kaylor	14	145,427
Organ valve, pipe, W. Schulke	106	145,453
Oil cloth, machine for printing, W. E. Worth	117	145,379
Ore washer, R. Solliday	3	145,455
Paper, designer's, A. Akeroyd	108	145,269
Paper cutting machine, G. A. Walker	109	145,464
Peg cutter, A. Whittemore	175	145,469
Piano forte action, A. K. Hebard	113	145,417
Plane iron, E. Quast	29	145,311
Planing machines, shaving conductor for, W. Weaver	100	143,375
Planter, corn, J. Case	133	145,396
Plastering machine, Stevens and Watson	4	145,459
Plow, subsoil gang, C. Myers	114	145,361
Press, copying and folding, S. W. Odell	146	145,306
Printers, perforating rule for, C. W. Ames	117	145,380
Printing presses, inking apparatus for, M. England	117	145,341
Propeller for vessels, vibrating, J. D. Fraser	139	145,342
Railway rail joint, W. G. Dunn	120	145,339
Railway rail joint, W. Thompson	120	145,372
Railway signal, pneumatic, W. E. Prall	158	145,309
Railway tracks, repairing, Warfield and Elmer	120	145,465
Railways, electric signaling apparatus for, F. L. Pope	50	145,306
Refrigerator, R. Thomson	58	145,317
Roller, sand paper, H. W. Brett	70	145,392
Sash balance, R. Faries	24	145,289
Saw gumming machine, H. Baughman	131	145,327
Screw, J. Frearson	171	145,411
Separator, ore, H. P. Minot	3	145,441
Sewing machine, Fanning and Nugent	134	145,287
Sewing machine shuttle, G. W. Hunter	134	145,348
Sheet metal ware, handle for, J. Fallows	136	145,286
Shirt, S. S. Gray	38	145,414
Shutter and window fastener, combined, W. T. Fry	24	145,343
Sifter, flour, F. G. Ford	57	145,410
Signal, pneumatic railway, W. E. Prall	158	145,309
Signal, switch, C. W. Spayd	120	145,456
Signaling apparatus for railways, electric, F. L. Pope	50	145,308
Skate, C. W. Jenkins	143	145,349
Skirt protector, G. E. King	38	145,429
Sleigh, A. A. Abbott	31	145,323
Sleigh bells, lathe chuck for, W. E. Barton	100	145,383
Smoke stack, T. F. Conklin	94	145,279
Soap cutting machine, J. B. Ultsch	26	145,319
Spinning machine, C. S. M., and H. M. Williams	142	145,322
Spool stand, W. Harris	38	145,297
Steering apparatus for vessels, C. W. Buflington	139	145,394
Stone, artificial, T. Chrimes	153	145,277
Stone cutting and dressing machine, West and Fish	153	145,376
Stone, manufacturing artificial, E. L. Ransome	153	145,363
Stove, cooking, L. E. Clow	154	145,276
Stove, cooking, S. Long	154	145,355
Stove, heating, J. Johnson	154	145,424
Stove, subaqueous gas, S. H. Starr	65	145,458
Sugar from molasses, &c., cleansing, A. H. Tait	155	145,460
Table and desk, combined drawing, J. A. Wilkens	62	145,378
Thill coupling, W. R. Bowman	31	145,390
Ticket case, L. J. Blades	146	145,388
Tobacco package, G. Robinson	160	145,451
Towel rack, C. Schermerhorn	62	145,367
Trap, steam, J. Bishop	150	145,387
Truck, hand, N. Adams	31	145,268
Trunk, H. L. Lowman	162	145,435
Tubing, machine for making metallic, J. Huggins	163	145,421
Umbrella, G. W. Pressey	165	145,310
Umbrella supporter, W. A. Drown, Jr	165	145,408
Urinal, J. C. Garnsey	8	145,344
Vehicle, Gorman and Thiel	31	145,413
Vessels, construction of, H. Hirsh	137	145,347
Water wheel, M. H. Heylman	168	145,346
Water wheel, J. Taney, (reissue)	168	5,682
Weaver's harness, machine for making, J. H. Crowell	95	145,282
Wells, constructing, A. Curtis, (reissue)	124	5,677
Wheel, vehicle, A. Buchholz	31	145,393
Wheel, vehicle, D. B. French	31	145,291
Windmill, M. T. and M. C. Chapman	118	145,335
Wire, G. D. Dudley	170	145,285
Wire stand or holder, G. D. Dudley	170	145,283
Wood bending machine, H. Hanna	176	145,416
Wrench, ratchet, I. C. Colbert	100	145,399
Yokes, bow pin for ox, W. J. Ivee	72	145,422
Yokes, combined bow fastener and guard for ox, E. N. Bacon	72	145,381
Zinc, apparatus for granulating, E. H. Richter	99	145,449

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED DECEMBER 9, 1873.

Abbott, A. A., Sleigh	145,323
Adams, L., Bee hive	145,324
Adams, N., Hand truck	145,268
Akeroyd, A., Designer's paper	145,269
Allbee, J., Harness buckle	145,270
American Steam and Water Recording Company, assignee	145,369
Ames, C. L., assignee	145,304
Ames, C. W., Perforating rule for printers	145,380
Arndt, A. F. R., Game board	145,271
Bacon, E. N., Combined bow fastener and guard for ox yokes	145,381
Baker, H. M., assignee	145,348
Baker, J. G., Blowing machine	145,382
Barker, G. W., Churn dasher	145,272
Barnum, H. W., Compressing cast metals in liquid state	145,325
Barton, W. E., Lathe chuck for sleigh bells	145,383
Bates, A. E., Composition for lining furnaces, crucibles, &c	145,326
Baughman, H., Saw gumming machine	145,327
Baumgartner, F., Carriage curtain fastening	145,328
Baxendale, S., Lubricating packing for journals, shaftings, &c	145,384
Bean, R. E., Game apparatus	145,385
Beard, G. N., Cotton bale tie	145,273
Beissel, S., Meat holder	145,329
Bergtold, L., Muff stand	145,330
Binns, L., Machine for making endless bands	145,386
Bishop, J., Steam trap	145,387
Bladen, L. J., Ticket case	145,388
Blake, C. E., Metallic foil for dental purposes	145,274
Blake, C. E., Dental fillings	145,275
Blake, L. R., and A. S. Libby, Heel for boots and shoes	145,389
Boerckel and Krapf	145,353
Bowman, W. R., Thill coupling	145,390
Bracher, T. W., Ornamental label for hat linings	145,391
Bradley, G., Wheel cultivator	145,331
Brett, H. W., Sand paper roller	145,392
Brown, H. L., Burglar alarm	145,332
Buchholz, A., Wheel for vehicles	145,393
Buffington, C. W., Steering apparatus for vessels	145,394
Bullard, W. A., Lubricator for car wheels	145,395
Bullock, J., Carriage spring	145,333
Camp, Merrill, and Vaughn	145,373
Case, J., Corn planter	145,396
Cass, J. F., Milk can	145,334
Chapman, M. T. and M. C., Windmill	145,335
Chrimes, T., Artificial stone	145,277
Churchman, N., Ingot mold	145,278
Clark, B. H., assignee	145,398
Clark, C. B., Mop head	145,397
Cloutman, J. F., assignee	145,295
Clow, L. E., Cooking stove	145,276
Coapman, E., Machine for bending hoops	145,398
Colbert, I. C., Ratchet wrench	145,399
Cole, J. R., Can for paints, &c	145,400
Collins, J., Door key	145,401
Collins, O. N., and P. B. Stiles, Draft equalizer	145,474
Condron, H., assignee	145,301
Conklin, T. F., Smoke stack	145,279
Cook, F., assignee	145,357
Cook, S. S., assignee	145,467
Cook, S. S., Carriage axle	145,280
Cooper, J., Brick machine	145,444
Cowles, H. D., Manufacture of horseshoe nails	145,336
Cranston, J. S., Mechanical movement	145,402
Crofatt, G. A., Eye and lung protector	145,337
Crouch, F. J., Steam and air engine	145,281
Crowell, J. H., Making weaver's harness	145,282
Curtis, A., Constructing wells, (reissue)	5,677
Dake, D. W., Butter worker	145,338
Dale, H., assignee	145,370
Darling, E. N., assignee	145,447
Davis and Lee	145,433
Delaney, M., Mold for rubber billiard cushions, (reissue)	5,680
Delaney, M., Billiard cushion, (reissue)	5,681
Dittmar, C., Explosive compound	145,403
Doring, E. N., Sofa bed	145,404
Drake, W. L., Fire extinguisher	145,405
Drake, W. L., Fire extinguisher	145,406
Drew, J. C., Lasting jack for boots, &c	145,407
Drown, W. A., Jr., Umbrella supporter	145,408
Dudley, G. D., Wire stand or holder	145,283
Dudley, G. D., Wire bottle stand	145,284
Dudley, G. D., Wire	145,285
Dugan, J. H., Re-using alkaline solutions from treating straw	145,409
Dunn, W. G., Railway rail joint	145,339
Earle, R. H., Ice creeper	145,340
Elmer and Warfield	145,465
England, M., Inking apparatus for printing presses	145,341
Fallows, J., Handle for sheet metal ware	145,286
Fanning, J., and E. Nugent, Sewing machine	145,287
Farciot, C. W., Filter for wine	145,288
Faries, R., Sash balance	145,289
Ferguson, P. H., assignee	145,457
Fish and West	145,376
Ford, F. G., Flour sifter	145,410
Fowler, H., Cigar box	145,290
Fraser, J. D., Vibrating propeller for vessels	145,342
Frearson, J., Screw	145,411
French, D. B., Wheel for vehicles	145,291
Frost, A. H., assignee	145,304
Fry, W. T., Combined shutter and window fastener	145,343
Garnsey, J. C., Urinal	145,344
Gathright, J. B., Machine for punching, splitting, and creasing bridles	145,292
Goddard, E., Steam generator	145,293
Godfrey, W. L., assignee	145,445
Gordon, W. J., Machine for cutting out and stamping up sheet metal boxes	145,412
Gormann, C., and J. B. Thiel, Vehicle	145,413
Graham, W. H., Hydrant	145,294
Gray, S. S., Shirt	145,414
Greacen, J., Jr., Flexible play pipe for hose	145,415
Hall, A. J., Shoe knife	145,295
Hall, F. H., Manufacturing artificial marble, and veining the same	145,345
Hanna, H., Machine for bending wood	145,416
Harlow, J. B., Sofa bedstead, (reissue)	5,678
Harrall, G. S., assignee	145,339
Harris, W., Stereoscopic camera	145,296
Harris, W., Spool stand	145,297
Haselip, J. N., Child's carriage	145,298
Hebard, A. K., Piano forte action	145,417
Heyer, A., Lounge	145,418
Heylman, M. H., Water wheel	145,346
Hickman, F., Harness loop	145,299
Hirsch, H., Construction of vessels	145,347
Hodges, A. J., Harvester dropper	145,419
Hopkins and Dickinson Manufacturing Company, assignee	145,401
Huber, B., Lithographic press	145,420
Huggins, J., Machine for making metallic tubing	145,421
Hunter, G. W., Shuttle for sewing machines	145,348
Ivee, W. J., Bow pin for ox yokes	145,422
Jenkins, C. W., Skate	145,349
Jerzmanowski, E. J., Manufacture of water gas	145,350
Johnson and Wever	145,377
Johnson, G. E., Corn shocker	145,423
Johnson, J., Heating stove	145,424
Johnson, J. G., Car axle box	145,425
Jones, E. P., Device for detaching horses	145,426
Judd, A. D., Metallic bracket	145,351
Judd, A. D., Inkstand	145,352
Kaylor, E., Nut lock	145,427
Keck, J., Car coupling	145,428
Kelsey, W. H., assignee	145,376
Kendrick Loom Harness Company, The, assignee	145,282
King, G. E., Skirt protector	145,429
King, J. M., assignee	145,432
Kitson, R., Feed regulator for cotton openers	145,300
Krapf, X., and J. F. Boerckel, Car coupling	145,353
Lambart, R. C., Machine for burnishing the heels of boots and shoes	145,430
Lapham, N. D., assignee	145,271
Lapham, R., Fountain brush	145,301
Latham, C. H., assignee	145,283, 145,284, 145,285
Laverty, W. A., Egg carrier	145,431
Lawrence, E. P., Folding coop	145,302
Lee, G. D., Bung faucet	145,432
Lee, J. W., and J. W. Davis, Disinfecting compound	145,433
Lester, W., assignee	145,307
Libby and Blake	145,389
Loetscher, C., Mitering machine	145,354
Long, S., Cooking stove	145,355
Loomis, M., Gate	145,434
Lowman, H. L., Trunk	145,435
Lubricating Car Axle Company, assignee	145,425
Lum, L. P., Crimping machine	145,303
Marshall, J., Corn sheller	145,356
Mason, W. M., Apparatus for sweating hides or skins	145,436
McClean, J., Device for forming bale ties	145,357
McGuffie, A., Angle iron cutter	145,437
McKibbin, J. C., assignee	145,376
Merrill, R. S., Lamp burner	145,438
Merrill, Vaughn, and Camp	145,373
Miller, F. L., Paint can and device for removing the contents	145,439
Miller, H., Can for paints, &c	145,440
Minot, H. P., Ore separator	145,441
Mitchell, J. M., Brick machine	145,358
Moody, W. F., Rotary steam engine	145,304
Moore, C. C., Curtain fixture	145,359
Moore, G. R., Stove grate	145,360
Morris, E., Bedstead	145,305
Morris, E. M., Gas cock	145,442
Morrison, R. H. D., Seed drill	145,443
Myers, C., Subsoil gang plow	145,361
Nichols, J. H., Gate fastener	145,362
Nourse, T., assignee	145,271
Nugent and Fanning	145,287
Odell, S. W., Copying and folding press	145,306
Parker, C., assignee	145,387
Patterson, L., Brick machine	145,444
Pack, C. O., Corpse preserver	145,307
Pope, F. L., Electric signaling apparatus for railways	145,308
Popping, J., Welding iron and steel	145,445
Porter, C. B., & Co., assignees	145,266
Potter, C., Jr., assignee	145,402
Potter, H. H., Car coupling	145,446
Prall, W. E., Pneumatic railway signal	145,309
Pressey, G. W., Umbrella	145,310
Quast, E., Plane iron	145,113

Ransome, E. L., Manufacturing artificial stone 145,363
Reigart, J. F., Endless driving belt 145,447
Richter, E. H., Composition for fire brick, stove linings, &c 145,448
Richter, E. H., Apparatus for granulating zinc 145,449
Richter, E. H. and F. G., Zinc furnace 145,450
Roberts, W., Jr., Rock drill 145,364
Robinson, G., Tobacco package 145,451
Robinson, M. P., Combined lounge and chair 145,452
Saladee, C. W., Railway car 145,365
Saladee, C. W., Railway car 145,366
Schaeffer, F. J., assignee 145,361
Schermerhorn, C., Towel rack 145,367
Schulke, W., Pipe organ valve 145,453
Scovill Manufacturing Company, assignee 145,315
Sharp, G. N., Latch for gates, &c 145,368
Shaw, B. F., Manufacture of glue 145,454
Sherwood, D., assignee 145,283, 145,284, 145,285
Solliday, R., Ore washer 145,455
Spayd, C. W., Switch signal 145,456
Spence, A., Water heater 145,457

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

The following abbreviated forms of the Patent Office classification by subject-matter may be of assistance to persons ordering copies of specifications and drawings by class. Of course the classes vary somewhat in number of patents, and in following a branch of industry it may be necessary to group several classes to secure absolute completeness. These groupings will readily suggest themselves to the inventor or mechanic.

Copy of classification in full for the use of subscribers furnished on application.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, DISTRICT OF CALIFORNIA.

WILLIAM SMITH *vs.* J. O'CONNOR *et al.*

[*In equity.—Before Sawyer, Judge.—Decision September* 1, 1873.]

A claim for "a receiver for pan water-closets formed and constructed so that the side A D, into which the pan C swings for emptying, will conform to the shape of the pan," &c., held, on comparing it with the specification, to be a claim not merely for a conformity, but for a conformity attained by specified means, and to be valid.

Held, also, on a like comparison with the specification, that the claim was not too broad.

A patent held not to be void for want of utility in the invention upon its appearing that it possessed certain advantages over others.

Although a third party had conceived of the invention before the plaintiff, and had made some progress toward completing a model, yet, if he then suspended his labors, and before he resumed them, the plaintiff had perfected the invention and had embodied it in a practical working machine, his patent will be sustained.

An invention will not be held forfeited in consequence of its having been on sale more than two years before the application was filed on which the patent issued, if within the two years the inventor had filed a previous application which described the invention, and was intended to cover it, although it was not specified in the claim in express terms. The second application will be considered a continuation of the first.

SAWYER, *J:*

I have had some difficulty in reaching a satisfactory conclusion in these cases. I shall mention some of the principal points involved, and those very briefly.

One main point relied on is that the specification in the patent is insufficient to cover the claim of the plaintiff as now presented.

It is insisted that the patent is for mere conformity, not for the form of the vessel—the change in the construction of the receiver of the water-closet. The language literally construed and the claim taken by itself, perhaps, might look so; but after considering the entire specifications and allegations I think that that position is not well taken. The specifications, it is true, might have been much better expressed, and, probably, if the parties should draw them after receiving the criticism, they would be drawn more clearly. I will make the remark here, which I have made before, that I do not recollect to have tried a single case but that similar objections have been made to the patent; showing the difficulty of making specifications which shall cover exactly what the party designs they shall cover, and no more, so that the patent may be free from criticism in that respect.

Now, in the description here it says—

> The nature of my said invention consists in constructing the receiver of water-closets so that I am able to make the side where the pan is hung correspond to the shape of the pan, and thereby save the waste space which is left behind the pan in ordinary or common receivers. Heretofore the receivers or containers of pan-closets have been constructed of an oval bowl-shaped hopper, with a covering plate, having an enlargement on one side, into which the pan swings when emptying.
>
> This construction forms a large space inside the receiver, behind the pan, which is not utilized, but, on the contrary, is detrimental to the closet in allowing obstructions to collect and impede the working of the pan.

Then there is a drawing given of the receiver, as he claims his receiver to be, specifying each particular point, and among others he says that "A A represent the two parts of the receiver bolted together, with the pan hanging in it as open. It will be noticed that there is no waste space behind the pan, but that the receiver conforms to its shape," going on and giving a particular description of each part of the instrument. He says, "By this mode of construction I am able to make a much more perfect article in form."

Then he claims—

> A receiver for pan water-closets, formed and constructed so that the side A D, into which the pan C swings for emptying, will conform to the shape of the pan, and avoid the waste space behind the pan, as in ordinary or common receivers, substantially as and for the purpose set forth.

Now, it is true that conformity is claimed there, but that conformity is produced in a manner which he before described, and he gives a drawing, gives each spe-

cific portion, the objects to be accomplished by his invention, and then this space is to be saved substantially as and for the purposes indicated—that is to say, by means of the instrument in the form and containing the parts before particularly described. I think, therefore, it is a claim, not merely for conformity, but conformity attained by the particular means which are heretofore set out, and the implement of which he has given a drawing. As I said before, that might have been more distinctly specified than it is; but, taken together, I shall construe it liberally in favor of the patentee, as I think it substantially covers the case.

Then it is claimed, also, that the claim is too broad, that it covers the lower part as well as the upper. Well, there is some difficulty in the description upon that point; but it is very difficult to describe a matter of that kind distinctly in language.

Still, he has given generally the description of the closets before used, and the particular difficulties to be overcome, and he has given a drawing of his own implement; and I think, upon the whole, the description is sufficient. All definitions must presuppose some knowledge of the subject-matter or knowledge of the matters referred to in giving the definition, and, of course, a reference is made to the state of the art as it before existed. Any one having to deal with these matters must be supposed to have some acquaintance with the subject-matter and the state of the arts. So, as I said, the description of the claim might have been better; but, from the construction which I have before indicated, I am inclined to think it is sufficient in the particular referred to.

The next point is as to whether it is useful or not; whether it attains any result. Well, the testimony shows that it is useful in several particulars. One is that it dispenses with the space which is behind and above the pan, and which was liable to clog up by reason of fragments of paper getting behind and remaining there, and afterward clogging the outlet. There are some witnesses here, it is true, who say they have never heard any such objection, while witnesses on the other hand testify that that objection did exist, that it was a serious one, and that this change obviates it.

The testimony is also that it takes less iron, that it reduces the size, that there is less trouble in transportation, that it takes up less room; and all these, it is claimed, are useful results. If that is true, undoubtedly this is a useful result, and I think the testimony shows it, upon the whole. Besides that there is the testimony that these closets supersede all others. That of itself is a very strong evidence that there is some useful result obtained. More than that, parties here are contesting this matter. The defendants here are using this form, and if there were no useful result in it there would be no occasion for them to be here contesting this invention. I think, manifestly, there is some useful result, and what I have spoken of in addition to the other testimony ought to displace any contrary view. I think there is a useful result, and that the implement is patentable in that particular.

The next objection is that one Carr, for whom the defendants sold, first made a model in 1854, which is prior to the making of the machine by the plaintiff. There is testimony here tending to show that he did make some progress toward making the model; but the testimony also shows that he never reduced it to a practical working machine until some time after making the model and laying it aside. The party having gone to Europe, in the mean time, and returned, it was afterward taken up. In the mean time the plaintiff had perfected his machine, and had made a practical working machine. I think, on that score, he is in advance of the defendants and entitled to the patent as between the two. It was merely an undeveloped idea with the defendants, so far as making a machine and putting it in practice is concerned.

It is contended, on the other hand, that the Culpin patent in England was an anticipation. Well, there was only one point on which it was contended that that was an anticipation, and that is conformity in the pan, &c. I do not think the Culpin machine is any anticipation of this machine—it is a different machine altogether; a machine of different form or make; and it does not appear that that was a practical working machine. At all events, it is a very different working machine from this, and I do not think it is an anticipation of this machine.

The next question is that more than two years elapsed after the making and selling of this machine by the plaintiff before he made his application for the patent. He first made his machine in 1866; in 1866 he presented an application for the patent; but the form of his claim in that application is different from the form of the claim here. That application was rejected. The claim there is—

> Constructing the receiver of a water-closet of two pieces, which are joined together, making a vertical joint, whereby I am enabled to make the receiver conform to the shape of the pan, substantially as herein shown and described.

Now, that was rejected on the ground claimed, that it was cast in two pieces, and the casting of the machine being in two pieces was nothing new; but the device claimed was precisely the implement as finally patented. His descriptions were mainly the same thing; he had the same drawing, precisely, as the one now had, and the object to be accomplished was evidently the same as he desires to accomplish in the last. The description, among other things, says—

> My invention consists in constructing the receiver in two pieces and bolting them together, whereby I am able to do away with the waste space behind the pan, and to save much expense in casting.

Now, one of his objects to be attained, as is alleged, is to dispense with that waste space. His machine and drawing are the same. Then he says—

> By this mode of construction I am able to make a much more perfect article in form, besides saving an important item in the weight of the casting, and, consequently, in transportation.

Again, his claim is—

> Constructing the receiver of a water-closet of two pieces, which are joined together, making a vertical joint, whereby I am enabled to make the receiver conform to the shape of the pan, substantially as herein shown and described.

The same ultimate object was to be accomplished by the dispensing with the useless space, reducing the expense in casting, &c. The same objects were to be accomplished, but he stated his claim in a different form. It was the same machine he was after. Now, if the view which the Patent Office took was that this claim was simply for casting in two pieces, and he had obtained a patent on that, it would not have covered the present objection. The law prescribes what shall be done when a party has failed to cover the points of his invention. This is the same invention, the same patent, the same drawings; but he had made an error in the presentation of his claim, and there are many facts. He not only amended it once, but more than once. I think it is manifest that the plantiff here endeavored to cover this invention. He did not stop upon the rejection on that ground, but after some correspondence with his attorney and some little delay, in which he does not appear to be very essentially at fault, he presents his claim again in another form, and it covers, as he supposes, the invention.

The Commissioner of the Patent Office must have considered that he was presenting his claim for the same invention, but that he had made an error in his prior claim, otherwise he would not have granted his patent upon the second application.

I am inclined to think, therefore, it is the same machine, the same invention, a claim for the same thing that he sought originally, which is presented in the last claim, and they therefore connect themselves together for the purposes of the two years—that is to say, he made his application within the two years after he began to make and sell the machine; and although he failed to get his patent on his first application, for the reason given that his claim was not patentable in the form in which he put it, he still renewed his efforts, and filed a new application for the same machine, the same invention, putting in his claim in a different form, and finally obtained it.

Under the decisions cited, one from the Supreme Court and one from one of the Circuit Courts, I think his applications connect themselves together—that is, his application for his patent for the thing which he desired to obtain, when first made, was for the same machine for which he has finally obtained his patent upon a corrected application. He sought to cover the same points in both applications, and he has followed it up, and the interval which elapsed between the rejection of the first and the filing of the latter does not make a material delay by the explanation of the testimony relating to it. His counsel resided in New York at that time. The communication was by steamer. He began to correspond immediately with his counsel. He followed it up, and finally succeeded in obtaining his patent. I think he has connected his applications together. The application for this invention is to be regarded as dating from the filing of the first application, he only changing the form of his claim.

These are the main points. There are one or two points I have some hesitation on, but I have concluded to give my judgment for the plaintiff.

It only remains to consider the question of damages. That is always a difficult point in patent cases. I have taken into consideration, however, the facts as to this class of closets, the prices which he sold at before the defendant came into the market as competitor, the fact of the reduction of prices by competition, and in all the probabilities of the case, the nearest I can come at it is to allow about four dollars a closet. I think that is not extravagant. In the case of *Smith* vs. *Prior* the damages are six hundred dollars, and in the case of *Smith* vs. *O'Connor*, six hundred and thirty-two. I shall not, however, double or treble these damages, in view of the fact that there was reasonable ground for contest between these parties.

SUPREME COURT DISTRICT OF COLUMBIA.

SMITH *et al. vs.* WOODRUFF.

[*In Equity.—Before Humphreys, Justice.—Opinion delivered September* 13, 1873.]

Where two patents have been granted for articles which resemble each other, a presumption arises from the action of the Office that there is such a difference between them that the use of one constitutes no infringement of the patent for the other.

If one paper-file holds the paper better than another which is patented, and has driven it out of market, that is *prima-facie* evidence that the mechanism is different, and is a new invention, and that the use of it does not violate the patentee's monopoly.

A patented combination may be used without infringing the patent if one of the elements of the combination is omitted, although another is substituted in its place which is new, or performs a substantially different function, or if it was not known as a proper substitute when the patent issued.

Although a bill for restraining the infringment of a patent is dismissed, the defendant will be allowed no costs if the rights of the parties are thereby settled, and a benefit consequently results to him as well as the public.

[*W. E. Edmonson*, attorney for plaintiff.

R. D. Mussey, attorney for defendant.]

HUMPHREYS, *J:*

In this case the complainant files a bill against the defendant, alleging therein an infringement by the defendant of the complainant's rights under a certain patent, and asking for an injunction. It alleges that Letters Patent were issued to the complainant for a certain invention for filing and holding papers; and that the defendant has infringed upon the rights of complainant under said patent, by making and selling a like machine. All which allegations are denied by the defendant.

The evidence shows that the application of the complainant for a patent was filed January 6, 1868; and that the defendant filed an application for Letters Patent for his machine January 7, 1868. That a patent was issued to defendant on the 31st March, 1868, and subsequently, on the 14th of April, 1868, a further patent was issued for further improvements; and that, on that day, the complainant's patent was issued, and that complainant's patent was afterward surrendered, and a reissue of the same made on the 9th day of April, 1872, for alleged infringement, of which this suit is brought. But it is not claimed that these dates make any difference now as to the question in controversy.

The Patent Office decided that there was no infringement, or conflict, between the two claims, and, so deciding, issued a patent to each party. It is here claimed by the complainant that that decision is erroneous; and the question now is whether the defendant's patent is an infringement upon the complainant's rights under his patent. The patent itself is made by law *prima-facie* evidence that everything that was necessary to have been done in the Office before the same could issue has been done; and that principle is carried even further than I at first thought a *prima-facie* case would go. But it is in the language of a reported case that I prefer to state this principle rather than in my own words.

In *Potter & Wheeler* vs. *Holland* (1 Fisher's Patent Cases) this principle is clearly stated. I have looked at the text, and it fully authorizes the head note, which is short, and which I will read:

The patent is *prima-facie* evidence that the several grants of right contained in it are valid; that the several things, methods, and devices contained in it are new; that they were useful; that they required invention; and that they were the invention of the patentee. And this *prima-facie* evidence must have full effect unless it is rebutted by sufficient countervailing evidence.

Now, that is the extent to which the *prima facie* evidence of the patent goes—it purports to be issued after everything required to be done has been done.

Now, here are *two patents*, and the question more particularly involved is whether or not the Patent Office decided correctly in deciding that there was no conflict between the two machines. The one *patent* is of as much force as the other; and the main question at present is whether the decision of the Patent Office, that there was no conflict between the two, is correct. I have come to the conclusion that the Office decided correctly.

In the case of *Gould* vs. *Rees* (15 Wallace, 187) the court says—

Patentable inventions may consist entirely in a new combination of old ingredients whereby a new and useful result is obtained; and in such cases the description of the invention is sufficient if the ingredients are named, the mode of operation given, and the new and useful result is pointed out, so that those skilled in the art and the public may know the nature and extent of the claim, and what the parts are which co-operate to produce the described new and useful result.

Damages are claimed by the plaintiff for the alleged infringement of certain Letters Patent, and he instituted for that purpose an action of trespass on the case against the defendant to recover compensation for the alleged injury.

Here in this case, the bill is filed seeking an injunction against the defendant for the alleged infringement.

The court there further says that—

Where the defendant, in constructing his machine, omits entirely one of the ingredients of the plaintiff's combination without substituting any other, he does not infringe; and if he substitutes another in the place of the one omitted, which is new, or which performs a substantially different function, or if it is old but was not known at the date of the plaintiff's invention as a proper substitute for the omitted ingredient, then he does not infringe.

Now, it is held that the principle in the two paper-files here is the same; but the *principle* is not what was patented, but the *mode* of *operation* and *construction* of the machines. The defendant's machine holds the papers more securely than the complainant's, and it is decided in *Singer* vs. *Walmsley* (1 Fisher's Patent Cases, p. 558) that—

If the result of the mechanism used by the defendants is greatly superior to that described and claimed by the patentee, this fact may be considered by a jury as tending to prove that the mechanism of the defendants is a new invention substantially different from that described by plaintiff.

It is in evidence fully in this case that the defendant's machine has supplanted entirely that of the complainant's; and the court is greatly relieved, and will be so all the way up to the court of last resort, by the presumptions in favor of the finding by the Office, to which is intrusted the determination of the question of patents and of conflicting claims therefor.

I am not disposed to interfere with that finding; and if there is no infringement there could be no interference.

The decree will be that this cause coming on to be heard, being argued by counsel, and on due consideration, it is ordered, adjudged, and decreed that the complainant's bill be dismissed, and that each party pay his own costs.

The reason that I come to this conclusion as to costs is that the public is benefited by this investigation, and the defendant is greatly benefited by having the case settled; and the complainant ought not to be required, perhaps, to pay more than his own costs, and it will be no hardship to the defendant to require him to pay his.

U. S. CIRCUIT COURT, EASTERN DISTRICT OF MISSOURI.

JAMES V. WESTLAKE *vs.* M. S. & H. B. CARTTER.

[*Before Treat, Judge.—Decided October* 11, 1873.]

It is not sufficient to give notice of special matter of defense in an action upon a patent thirty days before the trial; it must be given thirty days before the first day of the term.

Such notice need not specify the particular portion of the plaintiff's patent to which the evidence applies.

Patents may be given in evidence to show the state of the art without such notice; but printed publications cannot be.

The proceedings in the Patent Office upon the plaintiff's application for the patent are not admissible for the purpose of giving it a different construction.

If the defendant claims that the patent is void for uncertainty it rests with him to establish the charge.

The patent is not void for want of utility if the invention possesses it in any measure, however slight.

A combination may be patentable on account of the novelty of the arrangement, although all the elements are old.

A patent for a combination is not infringed unless all the elements enumerated are used, or the equivalents of those which are omitted are substituted for them.

To show that the parts omitted by the defendant from a patented combination are unessential will not render him liable as an infringer for the use of the rest.

A device is the equivalent of one that is patented if it performs substantially the same function in the same way and produces the same result, though it may be of a different form and bear a different name; and the use of it will be an infringement.

If the defendant has a patent it is evidence of the opinion of official experts that it does not conflict with the plaintiff's patent, and that in working under it he is guilty of no infringement.

Such evidence will be submitted to the jury; the court will not compare the patents.

If the patentee is engaged in manufacturing the patented article for sale, his damages will be manufacturer's profits.

[*M. Kinealy*, for plaintiff.

Saml. S. Boyd, for defendants.]

TREAT, *J:*

This was an action on the case tried before Judge Treat and a jury, upon the patent granted Jonathan L. Jones, November 6, 1860, for "Improvement in Truss-Bridges," numbered 30,577. The defendants plead the general issue, and gave notices of special matter, as will appear in the charge.

Certain rulings during the progress of the trial present points of value.

Defendants' counsel offered in evidence patent granted Geo. S. Avery, July 28, 1857, No. 17,864, to which plaintiff's counsel objected "on the ground that the particular portion of the plaintiff's patent it referred to was not specified in the notice." The notice was as follows:

The said defendants will further prove, upon said trial in bar of said action, that the plaintiff's assignor was not the first and original inventor of the invention described and claimed in said Letters Patent No. 30,577; but that long prior to said pretended invention the same was fully described and shown in the following Letters Patent—to wit, Letters Patent of the United States, No. 17,864, granted Geo. S. Avery July 28, 1857, for "Improvement in Segmental Truss for Bridges."

The Court overruled the objection, holding the notice sufficient.

PLAINTIFF'S COUNSEL. Now, I ask the court to take these patent papers [the Avery patent] and look at them, and see whether they have any bearing on this invention, [the Jones patent.]

TREAT, J. You have chosen to make this a jury case, and it must go there. When you chose to have a jury you chose to have this question determined in the light of expert testimony, and the jury will have to ascertain, from what the experts say in regard to it, what the facts are. I cannot take it away from them. If I were sitting as a chancellor then I would pass my judgment individually on them; but as I am not doing that, and you chose to have a jury, the jury will have to pass upon all these things. I cannot say whether they are alike or not, or what light they would throw on it. The experts will have to do that. It is for the court to construe the patent under consideration here; but as far as any questions of fact are to be determined in the light of expert testimony, the jury are the judges of that. Consequently we call in those who are skilled in this department to enlighten the jury in the one case or a chancellor in the other. There are two patents presented, and they require a large amount of mechanical skill outside of pure propositions of law, and this has to be obtained from this source—the experts.

Defendants' counsel offered in evidence the patent granted Wm. Howe August 28, 1846, numbered 4,726, for "Improvement in Bridges," being the same set up in his third notice of special matter, of which a copy had been filed and served on the plaintiff's counsel on the 25th day of August, 1873, to which plaintiff's counsel objected as not having been filed within thirty days of the first day of the term. The court sustained the objection, holding that, as in the eighth circuit the first day of the term was the "day of trial," the notice must be filed thirty days before the first day of the term, in order to be available. The first day of the term was September 15, but the trial of the case did not begin till the 7th day of October.

Defendants' counsel then offered the same patent in evidence for the purpose of showing the state of the art.

Plaintiff's counsel objected "that the patent could not be put in evidence for any purpose without notice; and if it went in at all it should go in merely to show priority of invention."

TREAT, J. I will only admit it to show the state of the art at the time of its date, not to impeach the validity of the plaintiff's patent.

Defendants' counsel then offered in evidence under the same notice a reference to "Mahan's Civil Engineering," which, being ruled out, was then offered as showing the state of the art. The court refused to admit it, holding that a scientific work could not be received for such purpose.

Defendant's counsel offered in evidence certified copy, file, wrapper, and contents of plaintiff's patent, "for the purpose of showing that when the application was originally presented the plaintiff's assignor endeavored to cover flat or square heads on the chord-bars; that such claim was rejected, and subsequently amended by withdrawing all claim to flat or square heads, and leaving only a claim for the curved heads, as showing what was really patented, and what was the agreement, as it were, between the applicant and the government as to the extent of his patent."

Plaintiff's counsel objected, and the objection was sustained, the Court holding the correspondence was not admissible.

Defendants' counsel was allowed, against the objection of plaintiff's counsel, to put in evidence Letters Patent No. 104,110 and 127,564, dated, respectively, June 14, 1870, and June 4, 1872, granted defendants for "Improvement in Truss-Bridges."

TREAT, *J:*

Gentlemen of the jury: This is a suit by plaintiff as assignee of patent No. 30,577, dated November 6, 1860, to recover of defendants damages for the alleged infringement by them of said patent.

The issues raised by the pleadings and notices filed are:

First, touching the validity of said patent, Are the descriptions and specifications in said patent in such full, clear, and exact terms as to enable one skilled in the art of bridge-building to construct a bridge according to said alleged invention with the aid of the drawings attached? or, on the other hand, are they so indefinite, uncertain, and ambiguous as not to enable a person so skilled to construct a bridge in accordance with the plan of the patentee? This principle rests on the doctrine that, while the inventive genius of the patentee is to be rewarded by a monopoly for a term of years, the public is to be compensated for such monopoly by having, after its expiration, the free and unrestricted use thereof, which free and unrestricted use cannot be enjoyed unless the description of the invention is sufficiently clear and exact to enable those skilled in the art to construct the same. On this point, under the testimony, it is supposed you will have very little difficulty, if any. If the description is not so uncertain, indefinite, and ambiguous in its terms, (which the defendant must prove,) then the patent is not invalid for the first cause assigned.

Second. Is the patent void for lack of usefulness? If the invention is not frivolous or prejudicial to the public, and has any degree of usefulness—no matter how slight the practical utility—then, within the meaning of the law, it is useful, and consequently not void for lack of utility.

Third. Is there want of novelty in the invention? Under this branch of the inquiry your attention is confined to the devices of the Whipple patent No. 2,064, April 24, 1841; of the Avery patent No. 17,864, July 28, 1857; of the Osborne patent, issued in England, No. 11,501, December 21, 1846, and of the description of the Severson iron bridge in Appleton's Engineers' Journal, (No. 10, vol. 2, October 1, 1852,) as received in evidence. The defendants can assail the Jones patent for want of novelty only on the grounds that some one or more of those patents or published descriptions had, prior to its date, covered the same ground. Under the law of the United States governing this matter—so that the patentee may not be taken by surprise—the defendant, if he wishes to assail the validity of the patent on the ground of lack of novelty, must specify precisely what patent or published description covered the ground of this alleged invention, so that he may have his attention specifically attracted at the time of the trial to the allegation as made; otherwise the patentee may come into court and have to meet anything likely to come from any book or the world at large concerning particular inventions. Hence these instructions confine you, as the law does, to those patents of which he gave notice, which he insisted already covered the ground occupied by the patentee. In this list no others come before you except the Howe patent.

I may state the plaintiff's patent cannot be assailed from any supposed imitation of that. That is introduced as a mere illustration, that the jury may see the condition of the art of bridge-building at that time. Whether plaintiff's patent covers any ground occupied by that is immaterial.

The foregoing inquiries appertain to the validity of

the Jones patent. That patent, having been duly issued, is presumed to be valid, and whoever assails it must show by competent evidence that it is void for some of the reasons alleged. If the defendants have not so done in this case, then the jury should consider it valid, and proceed to the next inquiry—viz., whether the defendants have been guilty of an infringement on it? If, on the other hand, the jury find it invalid under the evidence for any one of the three reasons mentioned, no further inquiry on their part will be necessary, and they will find for the defendants.

It is essential to the inquiries under the foregoing heads, and also to the question of infringement, that it should first appear distinctly what the Jones patent covers. The specifications and claims, there being no separation of the new from the old, as generally appears in a specification, call for a construction by the court. There are six distinct claims in this patent, each of which is patented. The plaintiff states to the court, however, that he does not rely on any other than the first, third, and sixth. Although the court, in order to ascertain what is embraced in the specified claims said to be infringed, must look to all the claims and the whole specifications in order to ascertain what is specifically patented in the first, third, and sixth, the attention of the jury under the evidence should be limited to what is embraced in these three claims as defined by the court. The first claim is for the "flexile curved splice in the lower chord, when said splice is formed of broad flat plates, with lateral curved offsets or lugs formed on their ends, said offsets pulling against one another, and allowing a free and independent movement of each plate in the path of a vertical circle, substantially as set forth in the drawings and specifications."

This is not a patent under this claim for the splicing of broad flat plates, with lateral offsets or lugs formed on their ends irrespective of their construction or intended functions. The object sought by the patentee was to secure such splicing by means of the indicated curving, so that the same may be flexile, to allow a free and independent movement in the path of a vertical circle. That first claim is not for any mode of interlocking by the use of lateral offsets or lugs other than this, which should be so curved as to allow a free and independent movement of the plates, as mentioned. The patent is not designed to cover any other device than that thus restricted—namely, "the flexile curved splice, allowing a free and independent movement in the path of a vertical circle." In other words, gentlemen, this contrivance of interlocking by offsets and lugs at the head is not what is patented. There is no claim in the patent for that as a specific thing; but it is in the curved flexile mode of splicing to secure this free and independent movement, so that when one of the plates moves it shall not necessarily move the other. That is the particular device patented in that connection.

The third claim is for "the metallic clamps or recessed blocks for retaining and holding together the tension-joints of the upper and lower chords or stringers, in the manner and for the purposes set forth."

It is obvious where several stringers are used to constitute the upper or lower chord, and are to be spliced at intervals, especially if the splicing is to be effected by interlocking with lateral offsets or lugs, it is important to have some mechanical contrivance to prevent a lateral and longitudinal displacement, whether caused by a change of temperature, loading the bridge, or from any other cause. This patent covers a specified device for that purpose—namely, recessed blocks, which served these and other supposed beneficial purposes, as sufficiently described by the testimony. That special device has its marked peculiarities. These are upper and lower blocks to be fitted together, each to be recessed, flared from the center outward, so that, in connection with the curved surfaces of the upper part of the upper block and the curved termination of the braces resting thereon, the bridge structure may in its different parts adjust itself automatically, as it were, to the various changes of camber.

The sixth claim is to the shoe at the abutment, "as constructed and combined with the lower ends of the tubular diagonal brace and the extreme ends of the lower chord, substantially as and for the purpose set forth." This is a claim, not for the specified parts of the combination separately, but for the combination itself. It is composed of three elements—viz., the shoe, diagonal brace, and extreme ends of the lower chords passing through the shoe, each to be constructed as set forth, and all combined in the manner indicated, so as to work out a given result. There is no infringement of the sixth claim, if the shoe is not the same, or the brace, or the ends of the lower chords passing through the shoe, for some if not all these were covered, in whole or part, in combinations with other devices, by other claims in the patent.

This sixth claim covers a combination of mechanical contrivances or devices to produce a given effect, and the question is, Did the defendants infringe that combination?—not Was any one of the many devices in the combination used? In determining the several questions of infringement, the jury must not judge about mere similarities or differences by the names of things, but must look to the whole structure and its several devices or elements in the light of what office or function they perform, and how they perform it, and find that a thing is substantially the same as another, if it performs substantially the same functions or office in the same way to attain the same result; but the devices are substantially different if they perform different duties or in a different way, or produce a different result. The substantial equivalent of a device is the same as the device itself—that is, if the patent mentions a specified mode of effecting a prescribed result, the substitution of any one or more mechanical equivalents for those specially mentioned will none the less work an infringement. The object sought by the modes of effecting the same, substantially as stated in the patentee's specifications, is covered by the patent, and whoever adopts the patentee's plan and works out the same result by merely substituting for one or more mechanical devices their mechanical equivalents or devices, is just as guilty of an infringement as if he servilely copied the patentee's device in all its parts. Hence, if the Jones patent is valid, and defendants have adopted his plan for accomplishing the result he sought, and also the mechanical contrivances he contrived therefor or their equivalent, they are guilty of an infringement. If, on the other hand, the result sought by the defendants was different, or if they sought the same result by an entirely different device or one that is not the same or equivalent, as in the patent, then they have not infringed.

The jury will bear in mind that plaintiff insists that defendants have infringed the first, third, and sixth claims, consequently, if they infringed any one of said three claims they are guilty, and damages should be assessed accordingly. The fact that the defendants have had granted to them patents since the issue of the Jones patent the jury have a right to consider and weigh. The issue of a patent follows the decision of official experts specially appointed and qualified to examine and pass on the claimed invention for which the patent is sought; hence plaintiff's patent is, *prima facie*, valid. But the same official experts have also granted defendants' patent, thereby expressing their opinion that the latter did not interfere with the former. Their opinion, however, is not conclusive. The plaintiff has a right to rely on the presumption springing from his older patent, and it is for the jury to decide, in the light of the testimony produced on the trial, whether that presumption as to validity has been overthrown, and also whether defendants' patent interfered or infringed on plaintiff's patent. In doing so, they can take into consideration the fact of the issue of defendants' patent; so, if there be doubt or difficulty in reaching a conclusion, they may have the benefit of such official expression.

Of course a valid patent cannot be overthrown by the issue of a subsequent patent to another person for the same thing; but when the question of infringement is under consideration, and expert testimony is necessary, the action of official experts on the subject is entitled to some consideration, especially where doubt exists.

The jury should bear in mind that the object sought by plaintiff in his patent, was the adjustability of the various parts of the bridge structure on his plan, by means of flexile curved splices and convex and concave surfaces, respectively, of the top angle-block, bridge-seats, and brace-ends. Where a combination is claimed the patentee cannot abandon part of said combination and maintain a claim to the residue, nor prove any part thereof immaterial or useless without destroying the whole. For the combination is an entirety, and if one of the elements is given up the combination disappears. From what has been said the jury will understand that several propositions are to be considered as to the validity of the Jones patent. On the ground of novelty, let it be borne in mind that it is not necessary that a patent for a combination should rest on novelty of parts or elements combined, but on novelty of the mode of combining the parts.

As to the infringement the main points are, What is the Jones patent? and next, Did defendants use any of the three plans named as new in the first, third, and sixth claims thereof? As to some of the first bridges built by defendants the jury should consider the testimony presented—viz., that the plaintiff gave his consent thereto or sold some of the parts thereof. As to those to which he gave his consent no damages can be recovered; as to the others, if any, he is to receive manufacturers' profits thereon.

The jury found for the defendants.

APPLICATIONS FOR EXTENSION.

Applications having been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

26,860.—Machines for the Manufacture of Tinware, granted to SAMUEL J. OLMSTED, January 17, 1860. Application filed October 16, 1873. Testimony closes December 16, 1873. Hearing December 31, 1873.

26,891.—Catches for Spectacle-Cases.—Granted to GEORGE N. CUMMINGS, January 24, 1860. Application filed September 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,902.—Planing-Machines.—Granted to SOLOMON S. GRAY, January 24, 1860. Application filed October 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,906.—Stitches.—Granted to ALBERT F. JOHNSON, January 24, 1860. Application filed October 25, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,914.—Clothes-Wringers.—Granted to ROBERT O. MELDRUM and AMOS B. PAXSON, January 24, 1860. Application filed October 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,919.—Repeating Fire-Arms.—Granted to WILLIAM H. MORRIS and CHARLES L. BROWN, January 24, 1860, and reissued August 1, 1871. Application filed October 23, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,942.—Seats and Couches for Railroad-Cars.—Granted to THEODORE T. WOODRUFF, January 24, 1860. Application filed October 25, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,948.—Sewing-Machines.—Granted to ALBERT F. JOHNSON, January 24, 1860. Application filed October 24, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,952.—Lamps, granted to GEORGE NEILSON, January 24, 1860. Application filed October 18, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

27,008.—Machines for Attaching and Finishing Boot-Heels.—Granted to HERMAN SALOSHINSKY, January 31, 1860, and reissued March 26, 1867. Application filed October 28, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,020.—Variable Exhaust-Pipe for Steam-Engines.—Granted to GEORGE EDWARDS, January 31, 1860. Application filed November 1, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,023.—Calendar-Clocks.—Granted to EUGENE M. MIX and JAMES E. MIX, January 31, 1860. Application filed October 31, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,034.—Harvesters.—Granted to JOHN BUTTER, February 7, 1860; and reissued June 13, 1871. Application filed November 4, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,043.—Lock for Umbrella-Stands.—Granted to ALFRED M. FOOTE, February 7, 1860. Application filed November 8, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,065.—Coffee-Mills.—Granted to JOHN and EDMUND PARKER, February 7, 1860. Application filed October 9, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,094.—Machine for Making Cartridge-Cases.—Granted to ETHAN ALLEN, February 14, 1860, and reissued May 9, 1865, in two divisions, numbered, respectively, 1,948 and 1,949. Application filed November 11, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,135.—Sugar-Cutters.—Granted to CHARLES KUNZLER and WILHELM ROSENBROCK, February 14, 1860. Application filed November 13, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,139.—Hanging Rudders.—Granted to JOSEPH P. MANTON and HENRY A. BILLINGS, February 14, 1860. Application filed November 10, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,179.—Marking-Gages for Sewing-Machines.—Granted to CALVIN D. WHEELER, February 14, 1860. Application filed November 14, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,185.—Soldering-Irons.—Granted to ABNER BURBANK, February 4, 1860. Application filed November 8, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,241.—Photographic Cameras.—Granted to AUGUST SEMMENDINGER, February 21, 1860. Application filed November 20, 1873. Testimony closes January 20, 1874. Hearing February 4, 1874.

27,291.—Seed-Planters.—Granted to JOHN S. HUGGINS, February 28, 1860. Application filed November 24, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,297.—Couches for Railroad-Cars.—Granted to EDWARD C. KNIGHT, February 28, 1860. Appli ation filed November 29, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,303.—Fastening Saw-Handles.—Granted to JACOB NEIMEYER, February 28, 1860. Application filed November 28, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,319.—Machine for Bending Sheet Metal.—Granted to ORSON W. STOW, February 28, 1860; and reissued August 4, 1868. Application filed October 29, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,357.—Table-Cutlery.—Granted to JOSEPH W. GARDNER, March 6, 1860. Application filed December 3, 1873. Testimony closes February 3, 1874. Hearing February 18, 1874.

27,392.—Machine for Folding and Pasting Paper.—Granted to GEORGE K. SNOW, March 6, 1860. Application filed December 3, 1873. Testimony closes February 3, 1874. Hearing February 18, 1874.

27,403.—Steam and Fire Regulators.—Granted to JOSEPH WOODRUFF, March 6, 1860. Application filed December 5, 1873. Testimony closes February 3, 1874. Hearing February 18, 1874.

27,406.—Cultivators.—Granted to ROBERT CRAIG, March 6, 1860. Application filed November 22, 1873. Testimony closes February 3, 1874. Hearing February 18, 1874.

27,438.—Blackwashing-Molds for Casting.—Granted to WILLIAM FERGUSON and DAVID FERGUSON, March 13, 1860. Application filed December 10, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

27,447.—Chain for Timber-Bending Machines.—Granted to LEVI HEYWOOD, March 13, 1860. Application filed December 13, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

27,456.—Machines for Covering the Springs of Skeleton Skirts.—Granted to JOHN T. LOFT, March 13, 1860. Application filed October 6, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

27,478.—Turning-Lathes.—Granted to WILLIAM SELLERS, March 13, 1860. Application filed December 13, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

27,485.—Lanterns.—Granted to AUGUSTUS TUFTS, March 13, 1860. Application filed December 12, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

27,545.—Fitting Sinks.—Granted to JAMES INGRAM, March 20, 1860. Application filed December 15, 1873. Testimony closes February 17, 1874. Hearing March 4, 1874.

27,594.—Sewing-Machines.—Granted to L. W. LANGDON, March 20, 1860. Application filed December 13, 1873. Testimony closes February 17, 1874. Hearing March 4, 1874.

27,627.—Cultivators.—Granted to CYRUS M. HALL and DAVID E. HALL, March 27, 1860, and reissued October 14, 1873. Application filed December 20, 1873. Testimony closes February 24, 1874. Hearing March 11, 1874.

27,641.—Harvesters.—Granted to FRANK T. LOMONT and JOHN GROJEAN, March 27, 1860, and reissued June 11, 1872. Application filed December 20, 1873. Testimony closes February 24, 1874. Hearing March 11, 1874.

27,636.—Horseshoe-Nail Machines.—Granted to WILLIAM TALLMAN, March 27, 1860. Application filed December 15, 1873. Testimony closes February 24, 1874. Hearing March 11, 1874.

27,743.—Feed-Water Arrangement for Steam-Boilers.—Granted to THOMAS SNOWDON, April 3, 1860. Application filed December 16, 1873. Testimony closes March 3, 1874. Hearing March 18, 1874.

28,004.—Railroad-Car Axles.—Granted to JAMES MONTGOMERY, April 24, 1860. Application filed December 17, 1873. Testimony closes March 24, 1874. Hearing March 8, 1874.

28,269.—Bayonet-Scabbards.—Granted to EMERSON GAYLORD, May 15, 1860. Application filed December 19, 1873. Testimony closes April 14, 1874. Hearing April 29, 1874.

30,467.—Apparatus for Singeing Pigs.—Granted to ABRAHAM and EDWARD M. DENNY, October 23, 1860. Patented in England February 2, 1860. Application filed October 17, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

31,262.—Fare-Boxes.—Granted to JOHN B. SLAWSON, January 29, 1861. Patented in England January 16, 1860. Application filed October 7, 1873. Testimony closes December 16, 1873. Hearing December 31, 1873.

EXTENSIONS GRANTED.

26,475.—Improvement in Breech-Loading Fire-Arms, granted to BETHEL BURTON, December 20, 1859; reissued December 21, 1869, numbered 3,770.

Claim.—1. The opening 13, arranged as described, in connection with the breech-piece and stock, for the purpose of allowing the escape of gas and smoke, preventing heating and clogging, and facilitating the lubrication of the parts, substantially as shown and described.

2. A breech-pin made in two or more pieces, with a broken joint or joints, when the front end has a reciprocating motion only, and the rear end a reciprocating and rotary motion, substantially as shown and described.

3. One or more projections on the forward end of the breech-pin for guiding it and holding it in place, when made and operating as shown and described.

4. The L-shaped groove 11 in the breech-pin, in combination with the pin or projection 12 on the inside of the breech-piece, when arranged and operating as shown and described.

5. A concavity or depression on the front end of the reciprocating breech-pin, receiving the conical rear end of the barrel, in combination with a sliding packing-ring in the rear end of the barrel, when made as shown and described.

6. The combination of the breech-piece, and the reciprocating breech-pin made to slide therein, when provided with sectional screws, as shown and described.

Disclaimer filed December 4, 1873.

Disclaims the first clause of the recital of the nature of invention, viz:

"First, an opening in the breech-piece and stock to allow the escape of gas and smoke, prevent heating and clogging, and keep the working parts lubricated."

Disclaims, also, the first clause of claim as above set forth.

26,484.—Improvement in Platform-Scales, granted to THADDEUS FAIRBANKS, December 20, 1859.

Claim.—1. The arrangement and application of the yoke, stirrup, their concave steps or bearings, and the pivots of the two multiplying and transmitting levers, substantially as specified, the whole being for the purpose and to operate as described.

2. Combining with the rod I, and the yoke applied thereto, as described, the cap or bonnet a^3, the same being for the purpose as specified.

26,486.—Improvement in Pipe-Molding, granted to JOHN FIRTH and JOHN INGHAM, December 20, 1859; reissued April 28, 1863, numbered 1,463, (MARY FIRTH and JOHN INGHAM executors of the estate of JOHN FIRTH, deceased.)

Claim.—Blackwashing pipe-molds by causing a stream or volume of the wash to flow through the interior of the mold, the said stream being controlled in the manner described.

26,487.—Improvement in Screw-Taps, granted to WILLIAM and ROBERT FOSTER, December 20, 1859, (WILLIAM FOSTER for himself and as executor of the estate of ROBERT FOSTER, deceased.)

Claim.—The combination of the oblique-backed taps C and slotted collar B with the tapering or conical stock A, substantially as shown and described, so that on turning the collar the cutting threads of the taps will be released from the nut, and thus allow the tool to be withdrawn, all as specified.

26,506.—Improvement in Water-Traps, granted to JAMES A. LOWE, December 20, 1859.

Claim.—The water-trap shown, when cast without a seam, (in lead or composition,) as a new article of manufacture.

DISCLAIMERS FILED.

26,475.—Improvement in Breech-Loading Fire-Arms.—BETHEL BURTON, Brooklyn, N. Y.—Patent dated December 20, 1859; reissue No. 3,770, dated December 21, 1869. Disclaims as follows:

"That part of the specification which includes the first clause of the recital of the nature of invention, and which reads as follows:

"'First, an opening in the breech-piece and stock to allow the escape of gas and smoke, prevent heating and clogging, and keep the working parts lubricated.'

"Also, the first claim, which reads as follows:

"'The opening 13, arranged as described, in connection with the breech-piece and stock, for the purpose of allowing the escape of gas and smoke, preventing heating and clogging, and facilitating the lubricating of the parts, substantially as shown and described.'"

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date December 16, 1873.]

7,049.—Lamp-Pedestal.—NATHANIEL L. BRADLEY, West Meriden, Conn., assignor to BRADLEY & HUBBARD, same place. Case D. Application filed November 22, 1873. Term of patent 7 years.

7,050.—Carpets.—JOHN FISHER, Enfield, assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed December 11, 1873. Term of patent 3½ years.

7,051.—Carpets.—OTTO HEINIGKE, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed December 11, 1873. Term of patent 3½ years.

7,052.—Carpets.—OTTO HEINIGKE, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed December 11, 1873. Term of patent 3½ years.

7,053.—Carpets.—OTTO HEINIGKE, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed December 11, 1873. Term of patent 3½ years.

7,054.—Carpets.—OTTO HEINIGKE, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed December 11, 1873. Term of patent 3½ years.

7,055.—Carpets.—OTTO HEINIGKE, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed December 11, 1873. Term of patent 3½ years.

7,056.—Carpets.—OTTO HEINIGKE, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed December 11, 1873. Term of patent 3½ years.

7,057.—Carpets.—OTTO HEINIGKE, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed December 11, 1873. Term of patent 3½ years.

7,058.—Carpets.—OTTO HEINIGKE, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed December 11, 1873. Term of patent 3½ years.

7,059.—Carpets.—OTTO HEINIGKE, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed December 11, 1873. Term of patent 3½ years.

7,060.—Carpets.—HENRY HORAN, East Orange, N. J., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed December 11, 1873. Term of patent 3½ years.

7,061.—Carpets.—HENRY HORAN, East Orange, N. J., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed December 11, 1873. Term of patent 3½ years.

7,062.—Show-Cases.—JAMES IRONS, Philadelphia, Pa. Application filed September 22, 1873. Term of patent 7 years.

7,063.—Casing of Soda-Water Apparatus.—GEORGE F. MEACHAM, Newton, assignor to JAMES W. TUFTS, Medford, Mass. Application filed November 20, 1873. Term of patent 14 years.

7,064.—Fur-Trimming.—ADOLPH MOLNAR, New York, N. Y. Application filed August 30, 1873. Term of patent 3½ years.

7,065.—Carpet.—JOHN H. SMITH, Enfield, assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed December 11, 1873. Term of patent 3½ years.

7,066.—Carpets.—JOHN H. SMITH, Enfield, assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed December 11, 1873. Term of patent 3½ years.

7,067.—Handles of Table-Casters.—HORACE C. WILCOX, West Meriden, Conn., assignor to THE MERIDEN BRITANNIA COMPANY, same place. Application filed November 22, 1873. Term of patent 7 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date December 16, 1873.]

1,574.—Goods Made of a Composition Substitute for Bone, Horn, Hard Rubber, &c.—GERMANELLE MANUFACTURING COMPANY, New York, N. Y. Application filed December 9, 1873.

"'Hallolite.'"

1,575.—Burning-Fluids and Liniments.—NETTERFIELD & SMITH, Burr Oak, Mich. Application filed October 31, 1873.

"a star having five points, and upon the center of which is the figure of an acorn."

1,576.—Whisky.—DAVID PORTER, San Francisco, Cal. Application filed December 5, 1873.

A "shield with the St. Andrew's cross, with letters 'D P S F' surmounted with the helmet and thistle, and label with a hand, together with the ribbon below the shield, upon which are the words 'Honesty is the best Policy,' and the circular ribbon above, with the word 'Shield.'"

1,577.—Perfumes, Medicines, &c.—GEORGE J. WENCK, New York, N. Y. Application filed November 22, 1873.

"a shield surmounted by an eagle."

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date December 16, 1873.]

ORIGINAL PATENTS.

145,475.—Scythe-Holder for Rag-Cutters.—EDGAR D. ALDRICH, Pittsfield, Mass. Application filed May 7, 1873.

The scythe-blade is secured in an angular slot in the holder by a clamp-bar held by a screw-nut.

Claim.—The scythe-holder, consisting of the flanged shell B, having the openings *d g* and nut O, in combination with the hook-bolt L and nut W, the parts being constructed and arranged substantially in the manner and for the purpose as set forth.

145,476.—Straw-Cutter.—THOMAS D. ANDERSON, Bardstown, Ky., assignor of one-third his right to ENOCH E. MCKAY, same place. Application filed June 28, 1873.

The knives are attached to the hub of the gage-wheel. In cutting they pass between the stationary cutter and a supporting-blade. The feeding-rake is automatically moved forward by cams on the feeding-shaft, and returned by means of springs.

Claim.—1. The blade F and knives D D, when said knives are made in a solid piece, and secured to the shaft as described, in combination with the wheel C, when made in a solid plate, to answer as a gage for the length of the straw, when arranged, constructed, and operated substantially as and for the purpose set forth.

2. The combination of the several devices for feeding up the straw, as above described, consisting of the frame K, with its springs L and rake M; also, the shaft G, cams J J, pinions H H, and box A, when arranged, constructed, and operated substantially as and for the purpose hereinbefore set forth.

145,477.—Device for Marking Dovetails.—GEORGE ASHBY, Decatur, Ill. Application filed November 18, 1873.

Dovetails are laid off by sharp edges on the marker being pressed upon the board.

Claim.—1. The markers D D D' D', in combination with the blades C or B, substantially as described, and for the purpose set forth.

2. The combination of the handle A, blades B C, markers D D D' D', and gages E E, as and for the purpose set forth.

145,478.—Magazine Fire-Arm.—ADOLPH ASMUS, Chicago, Ill., assignor of one-half his right to CHARLES ASMUS, same place. Application filed February 11, 1873.

Claim.—1. A breech-loading and repeating gun wherein the exit for the empty cartridge-shells is arranged in a line with the mouth of the magazine for the loaded shells or cartridges, and wherein the empty cartridge-shells are conveyed to the said exit by means of the cartridge-carriage operated upon through the medium of levers actuated by the hammer, and are then expelled

into the stock by means of the automatic action of the loaded shells or cartridges, substantially as specified.

2. In a breech-loading repeating gun, the sliding bar L, provided with the clasps or hooks *l l*, shoulder G″, and groove *m*, in combination with the hammer G, provided with the arm G′, constructed and arranged to engage the shoulder G″ and the shoulders of the groove *m*, and with the needle *n*, carried by the hammer G, and arranged to impinge the cartridge, all substantially as shown and described, and for the purposes set forth.

3. In a breech-loading and repeating gun, the stop-spring *d*″, having its free end arranged in the cartridge-exit and forward of the wall *b*, and for contact with the end and body of the cartridge, substantially as and for the purposes specified.

4. In a breech-loading and repeating gun, the combination, construction, and arrangement of the pivoted lever F, the lever H, hammer G, and trigger J, in connection with spring for operating the same, substantially as and for the purposes specified.

145,479.—Brush-Holder.—CHARLES L. W. BAKER, Camden, N. J., assignor to JOHN L. MASON, same place. Application filed September 16, 1873.

The rotary motion of an externally screw-threaded sleeve on the end of the handle gives, for the purpose of clamping a scrubbing-brush, longitudinal motion to a nut affixed to a wire frame forming the outer jaw, the other jaw being lateral loops on the extremity of the handle, through which the wire frame passes.

Claim.—A brush-holder, consisting of the screw-shank B, swiveled on the stick or handle A, in combination with the nut or ring D, the frame or yoke E, and hook G′, and with the head C and hook G, all as set forth.

145,480.—Steam-Trap.—ROBERT J. BARR, Philadelphia, Pa. Application filed November 10, 1873.

The tubes are prevented from expanding longitudinally, and their ends are secured rigidly, so that a lateral motion is imparted to the yoke and the valve as they contract and expand, thus opening and closing the valve.

Claim.—1. The method of operating the valve or valves of steam-traps by combining bent tubes with means for preventing their longitudinal movement, and for rigidly securing their ends, substantially as set forth.

2. The combination of the bent tubes, the slotted plate *o*, rod *m*, and valve *f*, substantially as and for the purpose set forth.

3. The combination of the bent tubes, slotted plate *o*, valve *f*, and yoke A, substantially as and for the purpose set forth.

145,481.—Window-Blind-Slat Adjuster.—ROBERT C. BEACH and GEORGE A. BERRY, Tidioute, Pa. Application filed March 26, 1873.

The blind is of the species the slats of which have a double pivot passing into a duplicate shifting-rod. In this case the shifting-rods are operated by a knob attached to a link, the shank of which knob passes through a slotted locking-plate, so that when pulled out the knob moves freely up and down in a vertical slot carrying the shifting-rods, but when pushed in a lug on the shank engages with transverse slots in the locking-plate, thereby holding the slots at any desired angle of aperture.

Claim.—1. The combination of connecting-rods A, cross-bars or levers B, caps C with projections *a*, knob *d*, and locking-plate O, substantially as and for the purpose herein described.

2. The shifting and holding link D, with its knob *d* and lug *f*, constructed and operating substantially as herein set forth, in combination with a locking-plate, O, having a guide-slot, *o*, and retaining-notches *n*, for the purpose specified.

145,482.—Tucker for Sewing-Machines.—JOSEPH H. BEAN, Cincinnati, Ohio. Application filed October 11, 1873.

The short and horizontally-projecting bent end of the plate rests beneath a previously-made tuck, and the line of seam is held and guided between the end of the plate and the shoulder formed by bending the plate up.

Claim.—1. The plate B, having the bent end adapted in connection with its main plate to gripe the line of the seam, as described.

2. The combination of the main plate A, recessed as described, with the adjustable and independent gage-bar D, as described.

3. The tucker described, consisting of the plates A B and gage-bar D, constructed and arranged substantially as described, for the purpose set forth.

145,483.—Means for Sinking Broken Piles.—ELIJAH C. BOOBAR, San Francisco, Cal. Application filed October 15, 1873.

The bell-shaped cap is designed to be placed over a sunken pile to assist in driving it beyond danger to passing vessels. A socket in the upper portion of the cap receives a second pile, and the two are secured together by the ropes to prevent the cap from being lost. The upper pile receives the blows from the pile-driver and transfers them to the pile to be driven.

Claim.—1. The described bell, having the mouth B and socket D, in combination with the beam E, the mouth B being adapted to guide the end of the broken pile to its seat, and the socket D to receive and hold the end of beam E, as described.

2. The combination of the bell A and pile E with the mousing F, substantially as described.

145,484.—Bottle-Cover.—WENDEL BOURGUIGNON, Providence, R. I. Application filed November 13, 1873.

A hinged cover provided with a valve is connected to a strap encircling the neck of the bottle by adjusting-screws, and is secured upon the mouth by cam connections.

Claim.—The combination of the straps C C with the adjusting-screws D and E, lip I, catch G, and cover A B, the whole operating substantially as described.

145,485.—Drawing-Knife.—MIDAS BROOKS, Chicago, Ill. Application filed January 15, 1873.

The handles are pivoted and fold over the cutting-edge.

Claim.—The implement herein described, having blade A, slotted handles B, with spring C, notch *f d*, and end *g*, all constructed and arranged as and for the purpose specified.

145,486.—Lath-Machine.—THEODORE BRUNO, Saginaw, Mich. Application filed November 17, 1873.

The saw-table is provided with a catch which prevents the lath-bolt from being drawn back by the carriage after it is sawed from the slab.

Claim.—1. The construction and arrangement, with relation to the frame A, mandrel B, and saws C C′, of the feed-roll shafts *c c¹ c²*, the pulley *g* and their belt *t*, the friction-pinion *k*, double-flanged friction-wheel E, shaft F, pinion G, and rack H on the carriage I, the lever K, rod L, arm M, rock-shaft N, and reverse lever O, the lever P provided with the latch *n*, and the cam Q on the carriage I, all arranged and operating substantially as and for the purposes herein set forth.

2. In a lath-bolting machine, the stop-latch *r* pivoted in the table, in the manner and for the purpose set forth.

145,487.—Photographic Background.—JOSEPH BUCHTEL, Portland, Oreg. Application filed February 28, 1873.

By the employment of a vibrating screen of gauze or net-work interposed between the sitter and the background a peculiar atmospheric effect is produced, and a toning down of the reflected light from said background essentially secured.

Claim.—1. The background for photographic use, composed of the parts A, B, C, D, and E, constructed and combined for operation substantially as described and shown.

2. The gauze or netted screen A, interposed between the object to be photographed and the part B of the background, when arranged to be oscillated, substantially as and for the purpose set forth.

145,488.—Grinding-Machine.—PERLEY D. CUMMINGS, Portland, Me. Application filed August 25, 1873.

Claim.—1. The annular wheel or grinder D, having the supports C, band K, and rotated upon the vertical shaft A, in the manner herein described, so as to be capable of use both upon the top edge and inner periphery thereof.

2. In combination with the annular wheel D, supports C, and band K, as described, the suspended table E and brackets F, rising from the fixed flooring G, as herein set forth.

145,489.—Hot-Air Furnace.—GEORGE W. DAY, Haverhill, Mass. Application filed July 7, 1873.

The products of combustion pass from the combustion to the smoke chamber through a series of pipes. These pipes pass through a deflecting plate, which diverts the air, heated by radiation, to the outside casing, up the inside surface of which it passes to the hot-air-exit flues.

Claim.—In a hot-air stove or furnace provided with a combustion and a smoke chamber, and a series of pipes connecting the two, and with an air-chamber surrounding the entire heat-radiating surface, the combination with the same of the horizontal partition or deflector K, constructed and arranged as shown and described, to divert the entire ascending currents of air and cause them to pass over the top surface of the fire-chamber, for the purpose stated.

145,490.—Meter.—LYMAN H. DEAN, Tecumseh, Mich. Application filed August 11, 1873.

The windmill-shaft is dropped into mesh with the pinion of the horizontal shaft, by means of which the spring upon the latter is wound up. The storing of power can be increased by connecting the shaft of the auxiliary spring-power, or it can be utilized in driving another machine during a lull of wind.

Claim.—The combination of the shaft B of a windmill with the shafts B′ and C, the spring D, the wheel E, and shaft G, connected and operating together, as described, and the frame J and its train of gears and springs, substantially as and for the purpose set forth.

145,491.—Portable Stove.—SARAH J. DIBBLE, Lockport, N. Y. Application filed September 10, 1873.

The fire-chamber is in the lower end of the main pipe. The supplemental pipe has on its upper surface a disk on which to warm dishes, &c., and a kettle may be heated in its upper end.

Claim.—1. The combined pipe and fire-chamber, arranged within the center of the casing A, for heating the baking-chamber, in combination with the supplemental pipe E, for heating kettles, dishes, and other articles, substantially as and for the purpose specified.

2. A portable summer stove, consisting of the sheet-metal body A, having the central grate *b*, central combined pipe and fire-chamber B, perforated plates *d*, supplemental pipe E, and elbow E′, all constructed and arranged substantially as and for the purpose specified.

145,492.—Buffing-Wheel.—EDWARD DIXON and WILLIAM DIXON, Newark, N. J. Application filed September 10, 1873.

Claim.—The process described of manufacturing buffing-wheels of felt, with the centers made hard by cement, substantially as and for the purposes set forth.

145,493.—Flood-Fence.—GEORGE W. DUNCAN, Columbia, Mo. Application filed June 27, 1873.

Two inclined timbers are secured to opposite ends of a sill-piece, to which sill are secured correspondingly inclined bottom-hinged gates provided with springs. The space between the two inclined gates is provided with a hinged gate which is also kept up in position by a spring.

Claim.—1. The string-piece A, provided with the inclined pieces B B, framed or otherwise secured thereto, in combination with the inclined hinged spring-gates E E, forming a continuation of the bank-fences, substantially as described, and for the purpose specified.

2. The timbers A B and hinged gates D E E, with springs *i*, arranged as described, and for the purpose specified.

145,494.—Breech-Loading Fire-Arm.—JOSEPH DUVAL, Parish of St. Joseph, assignor to LINUS ORTON THAYER, Montreal, Canada. Application filed December 5, 1873.

Claim.—1. The combination, in a fire-arm, of the breech-block, having the recess A, of the frame *r*, carrying the tumbler, the needle and operating parts, whereby the action, as a whole, as constructed, may be readily adjusted and removed, as specified.

2. The combination, as shown and described, of the tumbler *v*, needle *o*, spring *d*′, lever *m*, and breech-block *s*, for the purpose set forth and described.

3. The combination, with the trigger *y*, having a forward projection, as shown, of a stop or lock, arranged to slide on and project through the trigger-plate in front of the trigger-guard, as shown and described.

4. The mainspring *d*′, detachable, connected with the frame *r*, and combined therewith, and with a breech-loading fire-arm, substantially as shown, so as to be readily attached, or to be detached to render the arm unserviceable, as set forth.

145,495.—Recording Steam-Gage.—JARVIS B. EDSON, Brooklyn, N. Y. Application filed June 27, 1871.

A diaphragm steam-gage is connected with an apparatus which records all pressure in excess of a given degree.

Claim.—1. The adaptation and application, in circular dial-gages for recording or indicating pressure by hand and dial-plate, of two corrugated diaphragm steel disks or springs, connected together by iron compression-rings, screws, and packing on their outer edges, and receiving the pressure between them through an opening in the center of the back spring, where it is attached to the case, substantially as shown and described.

2. The combination and arrangement of the recording-pencil M, chart U, and reels J and K, with the arm or lever L, operated by contact with the pin or shoulder of the rocking lever G G, whereby an intermittent motion is given to the apparatus, and records of excessive pressure only are obtained.

3. The combination of apparatus, as shown and described, by which a record is given of all pressure in excess of a fixed limit, simultaneously with the indication of such pressure on the dial-plate by a hand, which also indicates all pressures below that limit.

145,496.—Preventing the Corrosion of Iron and Steel.—ROBERT A. FISHER, San Francisco, Cal. Application filed July 28, 1873.

Claim.—The method herein described for protecting iron against corrosion, consisting in the use of a mercurial solution or amalgam of aluminum, cadmium, magnesium, or zinc, the oxide of which is insoluble in water, substantially as above set forth.

145,497.—Bill and Paper File.—WILLIAM H. FOYE, Portland, Me. Application filed October 22, 1873.

The top or cover is hinged to a spring-clip attached to one side of the box, and is held down by an overlapping flap hinged to the opposite side.

Claim.—1. The combination of the base *b*, end piece *a*, hinged strip *f*, spring *j* having the edge *i*, flap *a*, flap *c*, and end piece *g*, as herein set forth.

2. The combination of the base *b*, end piece *c*, strip *f*, spring *j* having the edge *i*, flap *a*, flap *c*, catch *l*, end piece *g*, and side pieces *d*, as herein set forth, to operate as described.

145,498.—Medical Compound or Liver Lozenge.—SYLVESTER GILBERT, Portsmouth, N. H. Application filed April 28, 1873.

Claim.—A compound medicine consisting of leptandra Virginica, in combination with chelone glabra, sugar, and mucilage, substantially as and for the purpose specified.

145,499.—Gearing.—JOHN JAMES GREENOUGH, Syracuse, N. Y. Application filed July 15, 1872.

Semi-spherical gearing, connected by pivoted links, to transmit motion from one shaft to the other at varying angles.

Claim.—1. The teeth of the gear formed on the surface of the segment of a sphere, so as to radiate from the axis of revolution to the base, and the curve of the teeth made to conform at their pitch-line to the segment of a circle concentric with a point on the axis, substantially as shown and set forth.

2. The segmental gear having the number of its teeth diminished, and their thickness increased as they approach the apex of the gear, substantially as shown and described.

3. The segmental gears coupled by links, which are pivoted on a radial line in the plane of their axes coincident with the center of the pitch-line of the teeth, enabling the gears thereby to sweep through an arc, substantially as shown and described.

4. The segment-joint piece, constructed with a swivel, to enable the gears to sweep around the entire circle on the axis of the gear, substantially as shown and described.

5. The semi-spherical gears, in combination with the swivel-link, substantially as and for the purpose described.

145,500.—Stock and Die.—JASON W. HARDIE, New York, N. Y. Application filed May 2, 1873.

Claim.—The improved instrument herein described, composed of a stock and dies, a tap-wrench, a scale, a wire or drill gage, and a screw-thread gage, all substantially as herein specified.

145,501.—Machine for Buffing Boots and Shoes.—GARDNER C. HAWKINS, Boston, Mass., assignor to THE SHOE MACHINERY MANUFACTURING COMPANY, New Haven, Conn. Application filed July 22, 1873.

The machine is provided with a shallow draft-flue for collecting and carrying off the dust from the buffing roll or shaft. A reciprocating beam, provided with dies for stamping the different sizes, is attached to the front of the machine.

Claim.—1. In a buffing-machine for boots and shoes, the combination, with the buffing cylinder or wheel and buffing-chamber, of a top-draft flue independent of said chamber, and having its induction-mouth arranged and located, with respect to the buffing cylinder or wheel, substantially as herein shown and set forth.

2. In combination with the buffing-chamber and independent top-draft flue, the opening leading from the lower part of the buffing-chamber into said flue, and the gate or cover for closing the same, substantially as and for the purposes shown and set forth.

3. The stamping-beam and vertically-reciprocating frame for carrying the same, and lever or treadle for operating said frame, combined together and arranged on the front of the buffing-machine, as shown and described.

145,502.—Candlestick.—WILLIAM H. H. HINDS, Ayer, Mass. Application filed August 26, 1872.

The snuffing-blades are operated by independent shafts projecting below the chimney-support. The upper portion is adjustable upon the lower through means of a notched ridge and engaging spring.

Claim.—1. The two blades *a a*, operated by the movable rods *b b*, closing about the wick, substantially as and for the purpose specified.

2. The notched projection *i*, groove *k*, and spring *l*, constructed and operated substantially as and for the purpose described.

145,503.—Apparatus for Charging Soda-Fountains.—JOHN C. KENNEDY, Toledo, Ohio, assignor to JAMES W. TUPTS, Medford, Mass. Application filed November 20, 1873.

To make the apparatus compact, the purifier surrounds the acid-chamber, the gas being conducted from the generating-chamber to the bottom of the purifier through a bent pipe. To make an unobstructed outlet for the discharge of the contents of the alkali-chamber, the end of the discharge-pipe is beveled off on one side, and is closed by a correspondingly-inclined plug operated by a screw-rod.

Claim.—1. The chamber *p*, between the acid-vessel and the casing of the generator, for containing water for purifying the gas, in combination with the bent tube *q*, through which the gas is admitted, substantially as described.

2. The discharge-pipe *s*′, with its inclined face, in combination with the sliding plug *o*′, correspondingly inclined, and operated by a screw, *o*″, when applied to a carbonic-acid-gas generator, substantially as and for the purpose set forth.

145,504.—Cut-Nail Machine.—EBEN A. KIMBALL, Abington, Mass., assignor to himself, JOSEPH E. KIMBALL, and EDWD. MERRITT, same place. Application filed July 31, 1873.

The improvements are in details of construction, and consist of a supplemental support at the end of the main shaft; a spherical eccentric for operating the header; revolving the barrel K, through which the plate is fed, by means of straps passing partly around and fastened to adjustable collars; in the use of straight knives held in place by screws passing through lugs projecting in front; and in the hollow jaws M N, having openings in the rear through which the bearing-springs pass.

Claim.—1. The supplemental bifurcated support 16, constructed and arranged, as described, for supporting the shaft A, in combination with the shaft A, the support 15, rod X, and eccentric for operating the lever Y of the heading-tool Z, substantially as set forth.

2. The ball-joint 50, formed in one and the same piece as the shaft A, in combination with the connecting-rod X for operating the lever Y of the heading-tool Z, substantially as and for the purpose set forth.

3. The shafts G 21, with their rocker arms *c d f g*, in combination with the disk D, rods E H, crank *c*, and straps A A, with or without the adjustable collars *i*, for rotating the barrel K, through which the plate is fed, substantially as described.

4. The post L, made in two pieces, *n* and *o*, hinged at 36 37, and having a recess, 38, in combination with the spring 40, having a projection, 39, whereby I am enabled to throw back the barrel K without removing the straps, as described.

5. The adjustable hollow or channeled jaws M N, cast, as described, so as to form ways, in combination with the springs *s s* and bifurcated holder Q.

6. The adjustable hollow or channeled jaws M N, provided with lugs *r r* extending in front of, but not bridging over, the knives *p q*, substantially as and for the purpose set forth.

145,506.—Rotary Engine.—CHARLES C. KLEIN, Philadelphia, Pa. Application filed October 30, 1873.

Claim.—1. The pistons *a*, constructed of cylindrical or parti-cylindrical form, and having flat-arc bearing-surfaces *f* formed thereon, in combination with piston-slides *d*, having shoulders concentric therewith, and piston-links *h* arranged between these shoulders and a pivotal support, *b*, concentric with the cylinder, substantially as herein specified.

2. The combination of the opposite radial piston-slides *d*, having the arms 9 and the interposed expanding-springs *g*, as described.

3. In combination with the cylindrical or parti-cylindrical pistons, shouldered piston-slides, and central pivotal support, the piston-links *h*, attached to the pistons by stems 10, as herein set forth.

4. In combination with the cylindrical or parti-cylindrical pistons, shouldered piston-slides, and central pivotal support, the piston-links *h*, adjustable in length to take up wear, as described.

5. The combination, with the piston-links, of the automatic positive adjustment device, consisting of an adjusting screw or nut, 7, a spring, 8, attached thereto, to turn it forward, and a ratchet device, 9, for winding the spring, substantially as herein specified.

6. The steam-passages 12 in the pistons and piston-slides, for balancing the pistons and piston-slides, in the manner herein set forth.

7. The inner cylinder *m*, attached to one of the pistons and revolving therewith within the outer cylinder or case, substantially as herein described, for the purposes set forth.

8. The combination, with the inner revolving cylinder *m*, of the grooves 15, oil or tallow cups 16 17, and passages 18, arranged and operating substantially as specified.

9. The combination of the screws *q*, the springs *s*, and the non-circular traversing nuts *r*, working in corresponding recesses in the case, for adjusting and supporting the packing-plates *o p*, in the manner set forth.

10. The combination of the eccentric piston-wheel *c*, piston-slides *d*, pistons *e*, and a revolving cylinder, *m*, of one and the same length or width, and revolving between two parallel plain surfaces, as herein described.

11. In a rotary engine, the rearwardly-expanding cylinder-ports *u*, arranged and operating as herein set forth, for the purpose specified.

12. The reversible steam-chest *v* and the exhaust-nozzle plug or plugs u^3, in combination with the steam-nozzle u^2 and exhaust-nozzles u^4, formed and arranged substantially as shown and described, for the purposes set forth.

145,506.—Screw-Driver.—SYLVANUS R. KNEELAND, Charlestown, Mass. Application filed November 11, 1873.

A screw-driver is provided with a loose thimble encircling its shank, which is adjustable, and may be locked on the shank of the driver at such point that the blade will be exposed, when desired.

Claim.—The screw-driver described, consisting the various instrumentalities shown, constructed, arranged, and used substantially as and for the purpose set forth and specified.

145,507.—Fly-Trap.—TARLTON LANE, Whitesburg, Tenn. Application filed November 17, 1873.

A hinged door on the front is connected by rods with the rear of a slide-door, which is on the top of the box, so that when the end door is closed the top door or slide is open. A wire cage is also arranged on the top, having a sliding door on its lower side, so that the flies or insects can pass from the lower box into the cage, and be shut therein.

Claim.—1. The box A, provided with the aperture L, door B, and rods E, in combination with the slide H and cage M, substantially as shown and described.

2. The box A, provided with the aperture L, door B, and rods E, operated by the bar F, in combination with the cage M, provided with the slide H, substantially as shown and described.

145,508.—Sofa-Bedstead.—PETER J. LARSON, Chicago, Ill. Application filed May 31, 1873.

To the under side of the vertically-adjustable bottom frame are pivoted two cross-pieces, which are longer than the width of the frame, so that, when the bottom is elevated, the ends of the cross-pieces will enter mortises in the side of the sofa-frame. To one of these cross-pieces is attached a spring, to throw it out of the mortise when a connecting-cord is loosened. The main head or bolster is hinged to the folding frame, and provided with a hinged head-board, which is thrown back to form the pillow for the stationary frame, and is also provided with a spring or yielding board that comes up flush with the hinged pillow of the main frame.

Claim.—1. In a folding lounge, the combination and arrangement of the vertically-sliding bottom F, the pivoted cross-pieces F', the spring *f*, the mortises K K, and the cord G', substantially as and for the purposes specified.

2. In a folding lounge, the bolster C, linked or hinged to a folding bottom, and provided with the head-board L hinged or linked thereto, and with the yielding board L', all arranged and operating together, substantially as and for the purposes specified.

145,509.—Register for Tubular-Knitting-Machines.—DANIEL A. LEHMAN, Wakarusa, Ind., assignor to himself and JOHN D. GENEMO, Constantine, Mich. Application filed July 14, 1873.

By the action of the tension-weight a graduated bar is carried down through a slot in the top of a table of a tubular-knitting machine, and shows at the slot the number of inches knitted.

Claim.—The guides C, block D, arm E, pedestal F, scale-rod G, cord H, weight H', and guide-pulleys I I', in connection with any suitable stand and a circular-knitting machine, substantially as and for the purpose set forth.

145,510.—Manufacture of Carriage-Axles.—JOSEPH C. LONES, JABEZ LONES, CHARLES VERNON, and EDWARD HOLDEN, Smethwick, England. Application filed October 2, 1873.

The upsetting device contains a die, in two parts, fitted into a die-box that is adjustable by set-screws, for griping and holding the bar, and a reciprocating die in a solid block, into which the arm of the axle is thrust, the orifices of the dies having forms the counterparts of those to be given to the shoulders on each side of the collar proper. The rolls for finishing the collar revolve at right angles to the axis of the bar, the latter lying and rotating, during the operation, on two anti-friction rolls.

Claim.—1. The improvements in the manufacture of axles for carriages, such as hereinbefore described, and illustrated in Figs 1 and 2 of the accompanying drawings—that is to say, making the collars of said axles by taking a fagoted bar of iron and reducing the diameter of either end thereof, so as to leave near the arm end of the bar a part or round of larger diameter, then increasing the diameter and reducing the longitudinal extent of the said round by upsetting it to partially form the collars, and then finishing the same by rolling, substantially as described and illustrated.

2. The improvements in machinery for compressing or upsetting a round or enlarged part on the axle to form the collars of the axle, hereinbefore described, and illustrated in the accompanying drawings—that is to say, the combination of the holding-die *g h* and die-box *m* with the cylindrical or compressing die *i*, the said dies *g h* and *i* and die-box *m* being constructed, arranged, and worked substantially as described and illustrated.

145,511.—Machine for Bending Chain-Links.—CHARLES B. LONG, Worcester, Mass. Application filed May 23, 1873.

The wire, passing over the support T, is bent around the former S, the jaws G G' griping the wire and holding it against the former while the shaft is revolved. The jaws are alternately drawn back by the friction-rolls at their rear ends traversing a groove, in order to pass the support, after which they are again thrown out and gripe the wire.

Claim.—1. The combination of the revolving, adjustable, alternately griping and sliding jaws G G', adjustable gripers H H', former S, and support or rest T, constructed substantially in the manner described, as and for the purposes set forth.

2. The combination of the jaws G G', gripers H H', friction-rolls K K' and L L' with groove J, rim-piece C, face-plate B, former S, and support or rest T, when constructed and arranged to operate substantially in the manner described, as and for the purposes set forth.

3. The combination of the wing-pieces F F' F F', cam P, sliding box V, jaws G G', gripers H H', friction-rolls K K' and L L', spring M, rest T, groove J, shaft E, and cylinder B, mounted in frame A, when all are constructed and arranged to operate substantially in the manner described, as and for the purposes set forth.

145,512.—Hot-Air Furnace.—JOHN MAGEE, Chelsea, Mass., assignor to THE MAGEE FURNACE COMPANY. Application filed June 30, 1873.

The panels D and G are of soap-stone, the frame-work and the partition C of metal.

Claim.—The combination of the outer casing, formed of the grooved posts B and removable panels D, of soap-stone or other suitable non-conducting material, with the fire-pot A and the intervening metallic casing C, which divides the air-space between the fire-pot and the outer casing, thus forming two separate and distinct air-chambers, substantially as and for the purpose set forth.

145,513.—Hot-Air Furnace.—JOHN MAGEE, Chelsea, Mass., assignor to THE MAGEE FURNACE COMPANY. Application filed June 30, 1873.

The opening of the damper permits the escape of the gases, through the branch-pipe G, to the exit-flue.

Claim.—A trunk placed above the door of a hot-air furnace, and provided with a damper which is opened and closed by the opening and closing of such door, substantially as and for the purpose described.

145,514.—Till-Alarm.—WESLEY MALICK, Erie, Pa. Application filed January 24, 1873.

A series of levers within the drawer, operated by finger-rods in the usual way, is provided with a removable cap or tumbler for each, so that it may be made active or passive, according to its position of adjustment.

Claim.—The removable and reversible tumblers K, constructed to fit upon the upper ends of the levers J, and in combination with the same, for the purpose of changing the effect of the action of the finger-pieces H, substantially as shown and described.

145,515.—Sewing-Machine.—IRA MANNING, Philadelphia, Pa., assignor to MELANETHON S. FRINK, same place. Application filed September 23, 1873.

The operator, by pressing the knee against the pad under the table of the sewing-machine, can raise the presser-foot as desired.

Claim.—1. In combination with a presser-foot or its bar, occupying the ordinary position on a sewing-machine, the pad or pad-plate placed underneath the table thereof, and connected to said presser-foot or its bar by mechanism *h f d* B, as herein described, so that said presser foot or bar may be raised, held up, or let down by lateral pressure upon said pad or pad-plate, substantially as and for the purpose described.

2. The combination of the mechanism *b f d* B, pad or pad-plate *k*, hinged arm *j*, and bent arm or lever *h*, whereby said pad or pad-plate may be adjusted, not only vertically, but toward or from the position usually occupied by the attendant upon the machine, as described.

145,516.—Thill-Coupling.—HEZEKIAH MANWARING, Danville, Ky. Application filed September 3, 1873.

Claim.—The improved shaft-coupling consisting of the elastic bearing-block D and the holding-pin E, in combination with the furcated connection C having joint-pin *a*, and the clip or yoke A having the hook B and the projection *c*, essentially in the manner and for the purpose specified.

145,517.—Agricultural Boiler.—HORACE A. MEARS, Rockford, Ill. Application filed November 6, 1873.

The cylinder is placed in the vat or tub, whose contents are to be heated. An air-supplying flue terminates above the lower inclined end of the grate, and the draft-flue reaches below the elevated end.

Claim.—1. The inclined plate E, provided with the perforated flange *d*, and arranged, in relation to the outlet draft-flue G and the inlet draft-flue D, substantially as and for the purposes herein set forth.

2. The combination of the cylinder A, with bottom B and removable cover C, the draft-flues D G, and inclined plate E, all constructed and arranged substantially as and for the purposes herein set forth.

145,518.—Railway-Switch.—EDWARD MERCIER, Springfield, Mass. Application filed July 22, 1873.

In a switch which is operated by the approaching train, swinging inclined levers are arranged between the rails, said levers being operated upon by a vertical pendent bar which hangs in a slide. When the switch is properly set the vertical bar rides upon the incline, and is thereby raised, and does not act to move the levers; otherwise the bar, in moving along against the side of the lever, moves it to one side and sets the switch. The crank-ends of the shifting-bars are provided at one end with double inclines, which slide upon the rotating shaft *u*, said end having a slot in which works a pin, said slot allowing the pin to be raised from a center, and permits the rotation of the shaft. The eccentric W locks the switch so that it is impossible to shift it except through the inclines, or the crank *a*.

Claim.—1. In combination with the switch D, and with the shaft U, with crank T and eccentric W, or equivalent device, for diverting motion to the switch D, the hinged piece C, arranged and constructed to be operated substantially in the manner and for the purpose as set forth.

2. In combination with the switch D, and with shaft U, with crank O and eccentric W, the double incline V, operated in the manner and for the purpose set forth.

3. In combination with the switch D, the hinged pieces C and V, cranks T and O, shaft U, and eccentric W and handle *a*, the parts being relatively arranged to operate substantially in the manner and for the purpose set forth.

4. The crank O or T upon rod U, constructed so that the inclined surfaces 3 4 bear against the crank-shaft U, to start the crank from off a center and permit the pin *j* to play within slot *k* until the center is overcome.

5. In combination with the swinging beveled inclines between the rails, the slide *b*, to be raised by the inclines themselves when they are not in a position to be swung by said slide *b*, as shown and described.

145,519.—Die for Forming Rock-Drills and other Tools.—DANIEL MINTHORN, Gouverneur, N. Y., assignor of three-fourths his right to D. P. SMOCK, of New York city. Application filed March 20, 1873.

The die-stock has a mortise with flaring walls, and on the bottom of this mortise is a die, which, in shape, is the counterpart of that required to be produced on the end of a rod; and two tapered blocks inclose the extremity of the rod, and fill the space between it and the walls of the mortise. A rod with a heated end, so placed, is driven in from the opposite end, and made to take the shape of the die. The die and blocks are interchangeable with others of different shapes and dimensions.

Claim.—The combination of the die-stock A with the adjustable clamping-blocks D and die-plate B, for the purposes described, and made and operating substantially as hereinbefore set forth.

145,520.—Seed-Sower.—BEN MORSE, Ithaca, N. Y.—Case B. Application filed April 21, 1873.

The convertible wheel, with the cam-wheel attached, when upon one end of the axle-tree, operates the seed-slide by the inclined faces of the cams; but, when placed upon the other end, and turning in an opposite direction, presents the perpendicular faces of the cams to an adjustable catch-bar upon the rake-frame, whereby the rake is raised, at the desired moment, to discharge the hay.

Claim.—1. The slides X', X''', and W'', and plate Z', in combination with the bar *u*, lever W', and frame-piece X, combined and operated substantially as set forth.

2. In combination with the reversible wheel N, the wheel *n*, attached thereto, having cams formed with catches and undulations, as described, to operate a horse-rake wholly or in part when on one end of the axle-tree, and a sowing device when on the other end, substantially as set forth.

145,521.—Machine for Boring Hubs.—JOHN A. NEWELL, Kalamazoo, Mich. Application filed March 6, 1873.

The wheel is clamped to a hinged frame capable of being placed in either a vertical or horizontal position, and a boring-tool having a rotary as well as a longitudinal movement is passed through the center of the hub.

Claim.—1. The frame I, nut J, feed-screw K, guide-plate L, and guide-bars M, arranged and operating with relation to the frame B, substantially as and for the purpose set forth.

2. In a hub-boring machine, the semicircular end of the boring-bar having a circumferential slot, *i'*, and the internal stud *i* in the socket of the feed-screw, arranged and operating as and for the purpose set forth.

145,522.—Step-Ladder.—ANTHONY W. O'BLENIS, New York, N. Y. Application filed April 7, 1873.

The ladder is formed in two sections of equal height, one inclosed in the other, and so formed that it can be elevated, and sustained by hooks or by spring-braces, which latter expand and clutch the side-braces at the top of the lower section.

Claim.—The construction and combination, as described, of the sectional divisions in the above form and proportions, and the said supporting transverse brace, as above specified.

145,523.—Combined Latch and Door-Check.—ROBERT L. OMENSETTER, Philadelphia, Pa. Application filed October 28, 1873.

A latch for the doors of locomotive-cabs carries a bolt pivoted to it, which has a vertical movement in suitable guides attached to the door. There is also a stationary segmental rack, perforated with a series of holes, into which the lower end of the bolt enters, when actuated by movement of the latch, thus holding the door at any desired angle.

Claim.—The combination and arrangement of the combined latch C, bolt E, and segmental rack G with the door B, for holding the latter in an open position, substantially as described.

145,524.—Bit-Brace.—WILLIAM E. PERRAU, Oakland, Cal. Application filed June 5, 1873.

By an endless chain, operated by bevel-gearing and double pawls and ratchets, the reciprocating movement of the slide D causes the rotation of the boring-tool.

Claim.—1. The combination of the slide D having spring-pawl *e e*, with the chain B, the parts being arranged as described, for the purpose set forth.

2. The mechanism for changing the reciprocating motion of the slide D into a continuous rotary one, of the boring-tool held in the spindle *g*, consisting of the endless chain B, the pawls *e e*, pivoted in a reverse direction to each other, and in opposite sides of the slide D, and the springs *f f* for holding them in contact with the chain B, the pulleys *b c*, and the bevel-gears F F, constructed, arranged, and operating substantially as set forth and specified.

145,525.—Locomotive, Portable, and other Steam-Engines.—LOFTUS PERKINS, Seaford street, Gray's Inn Road, England. Application filed January 21, 1873.

An air-surface condenser, a water-tube boiler, and a compound engine are arranged upon a frame supported by wheels. Also combines a tubular air-surface condenser with the exhaust-pipe and a loaded relief-valve to prevent excess of internal pressure.

Claim.—1. The arrangement of the water-tube boiler, the air-surface condenser, and the compound engine all upon the same frame, supported by wheels, the whole constituting one locomotive implement, substantially as before set forth.

2. The combination, substantially as before set forth, of the tubular air-surface condenser, (having the surfaces of its condensing-tubes exposed to the atmosphere,) the exhaust-pipe connecting the said condenser with the steam-engine, and the loaded relief-valve for preventing any excess of internal pressure upon the tubes of the condenser.

3. The combination, substantially as before set forth, of the air-surface condenser, the exhaust-pipe connecting the engine and condenser, and the self-acting relief-valve to permit the excess of exhaust steam to escape from the condenser.

145,526.—Machine for Rolling Carriage-Axles.—JULIUS C. RICHARDSON, Philadelphia, Pa. Application filed May 29, 1873.

Motion is communicated to the driving-shaft through eccentric gear-wheels, which give to the shaft G' a variable intermittent motion, allowing the shaft to be automatically clutched and released during its slowest movement. A shaft lying parallel with the driving-shaft, to which it is connected by gears, has on it a cam-hub, and a pin projecting into its groove operates a shifting-bar, to which is attached a forked arm that shifts the clutch.

Claim.—1. The combination, with the rolls C C, of the eccentric spur-wheels G^2 J, shaft G, and the clutch, substantially as and for the purpose set forth.

2. The clutching-hubs D D', applied on the shafts C' G^1, in combination with the shifting-fork *e'* and its cam-hub *g*, and with grooved rolls C C, for the purpose of stopping and starting said rolls, substantially as described.

3. The notched stripper *b*, combined with the grooves 2 2 in the rolls C C, and with a supporting-roller, *b'*, substantially as described.

145,527.—Way-Meter for Wheel-Vehicles.—JONATHAN A. ROBINSON, Fremont, N. H. Application filed October 31, 1873.

A rotary cap, actuated by a spring-lever, has upon its inner circumference a pawl which acts upon a ratchet-wheel, whose shaft is connected with a registering-train. By means of an adjustable screw, against which a pin upon the cap strikes every time that the lever is tripped, the motion of the cap may be limited for vehicle-wheels of different sizes. There is also a peculiar pawl-connection between the primary and secondary wheels of the registering apparatus.

Claim.—1. The arm *l*, lever *n*, the impelling-pawl *k*, the spring *o*, the studs *m s*, and the two gears *b i*, all constructed, combined, and arranged within their case A, substantially as described.

2. The lever-spring *o*, the retaining-pawl *h*, the impelling-pawl *k*, the arm *l*, the lever *n*, the studs *m s*, and the two gears *b i*, all combined and arranged together and in and with their case A, as explained.

3. The adjustable stop-screw *z*, the stud *y*, and the elastic lever F, in combination and arranged as described with the rest of the mechanism, (viz., the rotary cap *u*, the impelling-pawl *x*, and ratchet-wheel C,) for revolving the main arbor D of the train.

145,528.—Fence-Post.—HERVY S. ROSS, Millville, Ohio. Application filed October 10, 1873.

A post is erected. A brace-piece of greater length is placed diagonally at two sides, stretching in different directions. The three are pivoted together at the top. A flat doubled piece of iron is pivoted to the post near the top and bottom, its loops extending outward. A key-piece passing down through these serves to hold the stretchers or rails.

Claim.—1. The combination of the bars *a b c* with the removable bolt *e* as a fencing-post, constructed and used substantially as described.

2. The fencing-post formed of the three bars *a b c* and bolt *e*, in combination with the adjusting-key *d*, or its equivalent, constructed and arranged substantially as described, for the purpose specified.

145,529.—Attaching Slates to Roofs.—DANIEL RYAN, Boston, Mass. Application filed November 10, 1873.

A mode of attaching slates directly to the metallic rafters by means of thin strips of flexible metal inserted into kerfs made in each side of the slate, an offset being formed for folding over the slate, while the other end is wrapped around or otherwise suitably secured to the rafters.

Claim.—1. The herein-described improvement in methods of attaching slates, the same consisting of a thin strip of ductile metal, one end of which enters a slot in the slate and is bent about the edge of the latter, while the other end of the strip is bent about or otherwise suitably secured to the stringers, or laid between corners of brick, substantially as and for the purposes stated.

2. The fastening-strip herein shown, consisting of a straight flat plate provided with the lip or offset E, or its equivalent, substantially as and for the purposes stated.

3. The slate provided with saw kerfs or incisions on its opposite edges, in combination with the fastening-strips, substantially as shown and set forth.

145,530.—Steam-Generator.—JOSEPH RYAN, St. Louis, Mo. Application filed September 22, 1873.

The boiler, with the usual mud-drums, is combined with one or more circulating-pipes, inclined in reversed directions and connected with the upper and lower opposite ends of the boiler by bonnets, so that the water circulates in reversed directions.

Claim.—1. The combination, with relation to boiler A or drums B B', of one or more circulating-pipes, C C', bonnets *c c'*, arranged as herein shown and described.

2. The arrangement of the pipes C C' with relation to boiler A or drums B B', so that, as circulation of water takes place through pipe C, from front of boiler to discharge at rear thereof, there is, at same time, an opposite action of circulation taking place through pipe C' from the rear of boiler, and discharging at front thereof.

145,531.—Lamp-Stove.—EDWARD SAVORAL, New York, N. Y., assignor to ELIAS SCHNAUTZ and EDWARD SAVORAL, same place. Application filed September 4, 1873.

An annular cylinder has the oil-fonts at and around its base. Within this hollow ring half-tubes containing cotton wicks extend from the oil-fonts upward to the wick-tube—a large annular vessel, shaped as the frustum of a hollow cone. In this wick-tube rests the wick-trough containing cotton, and adjustable perpendicularly by wires passing downward through the half-tubes to the wick-raiser, and carrying a wick (consisting preferably of asbestus) confined between two parallel sheets of wire-gauze. Air from without (within the flame) is turned onto its base by a deflector and a button, respectively. When the center of the button is removed its rim may support a culinary vessel. When the lamp is used for illumination the uppermost flaring portion is displaced by a mica chimney.

Claim.—1. In a lamp-stove substantially of the character herein described, the rigid wick-support C and wire-gauze *p p*, arranged as shown relatively to the system of wicks *m m¹ m²*, and a suitable annular wick-tube, oil-reservoir, and provisions for raising and lowering the wick-support and its connections, as herein specified.

2. In combination with the wick *m* and its supporting means C *p p*, with provisions for supplying oil thereto, the adjusting-ring E, having oblique slots receiving the internal projections *d* on the ring D, to allow of adjusting with great delicacy and uniformity all parts of the wick without obstructing the interior air-space, as specified.

3. The button having a permanently-supported rim, B, and a removable center, B¹, in a lamp-stove having an adjacent circular wick, *m*, and an inclosing deflector, H, all combined substantially as and for the purpose herein set forth.

145,532.—Electro-Pneumatic Action for Musical Instruments.—WILLIAM F. SCHMOELE and HENRY SCHMOELE, Jr., Philadelphia, Pa., assignors of one-third their right to CHARLES SCHMOELE. Application filed March 7, 1873.

A small wind-pocket, operated by an electro-magnet, is used as a trip to operate the valve of a wind-instrument.

Claim.—1. The use or application of an electro-magnet to operate a wind pocket or pockets employed to work the valve, substantially as set forth.

2. The form of pocket and valves employed, admitting the wind by a groove with double aperture, controlled by two valves or nuts opposed to each other on a screw-threaded wire, substantially as set forth.

3. The small or primary pocket with diminutive valve to control the large or secondary pocket, which operates the pallet or other resistance, substantially as described and set forth.

145,533.—Billiard-Table.—CHARLES SCHULENBURG, Detroit, Mich. Application filed October 27, 1873.

Four legs, disposed under the middle of the sides and ends, are combined at the sides with long braces, and within the frame with a cross-girt and strengtheners.

Claim.—1. In a billiard-table supported by four legs, the arrangement of said legs at the middle of the sides and ends of the frame, as shown and set forth.

2. In a billiard-table constructed as herein described, the combination with the legs B, of the braces C for supporting the frame A, as shown and set forth.

3. In combination with the legs B, arranged with relation to the frame A as described, the girt D and joists D¹ or D², constructed and arranged in the manner and for the purpose set forth.

145,534.—Safety-Valve for Steam-Boilers.—HENRY W. SHEPARD, Madison, Ind., assignor of one-third his right to GEORGE W. CABLE, St. Louis, Mo. Application filed November 10, 1873.

An auxiliary valve is provided to assist the main safety-valve in lifting the lever and weight. When the pressure in the boiler is sufficient to raise the main valve from its seat it will also operate on the weight, and the exposed surface of the piston in the small chamber, allowing steam to enter the large chamber and force the piston upward, thus assisting in lifting the lever and weight.

Claim.—The device, consisting of the piston-valve J, chamber G, weight K, and casing H, the cylinder L, piston M, and pipe *d*, in combination with the lever, weight, valve, and chamber, which constitute the elements of the common safety-valve, when arranged to operate substantially as shown and for the purposes specified.

145,535.—Cultivator.—JAMES E. SISSON, Bastrop, La. Application filed October 3, 1873.

The axle is bent upward in the middle, the sides of the bent portion forming guides for the forked ends of a sliding bar, which supports the front end of the cultivator-frame, and is adjusted vertically by a screw-bolt and nut-lever. The frame has subsoil-plows upon its front portion.

Claim.—In combination with the bent axle B and frame E, the forked slide G, screw-bolt D, lever and nut F, adjustable standards and shovels G K, and subsoilers L, as and for the purpose described.

145,536.—Cotton-Bale Tie.—DARIUS S. SKINNER, Providence, R. I. Application filed June 4, 1873.

Claim.—The bridge E, in connection with the ribs or abutments D D, and in combination with the bars F G, plane A, and abutment B, with its projection C, constructed substantially as herein set forth, and for the purpose specified.

145,537.—Mallet for Driving Tubes, &c.—CHARLES STEWART, Worcester, Mass., assignor of one-half his right to WILLIAM ALLEN, same place. Application filed October 1, 1873.

The body A is of cast-iron and the heads B of babbitt-metal run into them.

Claim.—A mallet, constructed as herein shown and described.

145,538.—Condenser for Steam-Pumps.—DAVID STODDART, San Francisco, Cal. Application filed July 21, 1873.

The suction-pipe is provided with an annular chamber, in which is arranged a lining having inclined perforations, as nearly as possible coincident with the current of water in the suction-pipe. The exhaust steam passes into the chamber and through the perforations into the column of water, and assists it in its onward course.

Claim.—The combination of the perforated lining D, the suction-pipe A, the chamber C, and the exhaust-pipe B, arranged substantially as described.

145,539.—Machine for Splitting Whalebone or Rattan.—JOHN TAGGART, Boston, Mass., assignor to JAMES A. SEVEY, same place. Application filed October 31, 1873.

The shaving or splitting knives are adjusted laterally by a double incline plane or wedge.

Claim.—The movable jaws B C, provided with a plane, as described, to either or each, and arranged in and with respect to the bed A, as set forth, in combination with the wedge-guide cam H, arranged with and applied to the bed A and the said jaws, by means substantially as explained.

145,540.—Device for Converting Motion.—HOMER WHEELER, Racine, Wis. Application filed November 20, 1873.

A cog-wheel is secured to the driving-shaft, which is journaled in the stationary frame. Sliding in guides within this frame is a reciprocating frame which is moved by a piston. Within the reciprocating frame is arranged a frame capable of lateral movement. This smaller frame carries two racks and idle-wheels, journaled at opposite ends of the same. As the piston is moved in one direction, one of the racks engages with the cog-wheel on the driving-shaft and revolves the same. As the piston reaches the end of its stroke the idle-wheel throws the opposite rack into gear, thereby imparting a continuous motion to the main shaft.

Claim.—1. The combination, substantially as described, of a fixed frame, in which the main gear-wheel is mounted, a frame reciprocating longitudinally in said frame, and a frame carrying the driving-gearing and racks, and reciprocating laterally in the longitudinally-moving frame, for the purposes specified.

2. The combination, substantially as set forth, of a gear-wheel, revolving in a fixed position, duplex racks reciprocating both longitudinally and laterally, relatively to said gear-wheel, and duplex idle-wheels at each end of said racks, for the purposes specified.

3. The combination, substantially as set forth, of a fixed gear-wheel, duplex, longitudinally, and laterally reciprocating racks, an idle-wheel at each end of said racks, and backing ratchets to prevent movement of said idle-wheels in the reverse direction.

4. The combination, with the racks, of the idle-wheels, arranged above the plane of the racks, on opposite sides and at opposite ends of the reciprocating frame, whereby the racks are automatically and alternately thrown into and out of gear at the end of each stroke, as specified.

145,541.—Windmill.—JOHN A. WHEELER, Chippewa Falls, Minn. Application filed September 3, 1873.

Two or more stationary annular sections, provided with radial floats or sails, and arranged to turn on their axes into and out of the wind by means of segment connecting-rods when the inner section of sails are thrown more into the wind than the outer section.

Claim.—A wind-wheel composed of two or more stationary annular sections, C', W, and X, which are provided with radial floats or sails F E, arranged to turn on their axes into and out of the wind by means of segment connecting-rods J J', when the inner section of sails is thrown more into the wind than the outer section, and combined with connecting-rods, cranks O P *c*, arms D, rod *a*, and sliding head L *b*, operated by a suitable governor, as set forth.

145,542.—Paper-Feeding Machine.—CHARLES M. WIELINGS, San Francisco, Cal. Application filed September 25, 1873.

The feed-board is hinged at one end and raised automatically by means of a worm-gear, screw, and pawl and ratchet, operated by means of a cam on the shaft. An adjusting-screw limits the movement of the pawl. The feed-roller consists of strips of flexible material arranged longitudinally on the roller, and it is intermittently rotated by a pawl and ratchet operated by a cam on main shaft. A bar provided with parallel slats is raised intermittently by another cam to support the paper after it is seized by the gripers, so that it will receive no further motion from the tapes.

Claim.—1. The carrying-tapes R and the intermediate bar U with its cross-slats V, which rise and fall alternately, for the purpose of supporting the paper and preventing its further movement by the tapes while it is being seized by the nippers, substantially as described.

2. The combination of the pawl H and bell-crank G with the adjusting-screw L, adapted to limit the movement of the pawl, as described.

145,543.—Leather-Perforating Machinery for Harness-Makers.—LORENZO D. WOODMANSEE, Hamilton, Ohio. Application filed June 30, 1873.

Claim.—In a leather-perforating machine, the arrangement of the reciprocating stock B, provided with a series of awls, and a guide, P, within the frame A, the bottom of said frame being provided with holes *b b*, substantially as shown, for the purpose described.

145,544.—Blacking-Box Holder.—SAMUEL T. WYMAN, Lynn, Mass. Application filed November 15, 1873.

The holder is formed in two semicircular sections adjusted to and from each other by screws operating in screw-ears formed on each side of said sections. The interior of the holder is also rabbeted to form bearings for boxes of different sizes. The holder is also provided with an adjustable cover having a slotted hinged plate held to the rear section by a screw to accommodate boxes of different depths in the holder.

Claim.—1. A blacking-box holder formed in two sections, A A', having ears B B', and held together and adjusted to and from each other by screws C C', to receive and hold boxes of different sizes, substantially as specified.

2. A blacking-box holder formed in two sections, A A', held and adjusted as above described, and rabbeted on the interior to form seats and bearings *a* of diminishing diameters, substantially as and for the purposes described.

3. In combination with a blacking-box holder, arranged as herein described, an adjustable hinged cover, H, having a slotted hinged plate, F, held or released from the rear section A' by a screw, I, substantially as and for the purpose herein set forth.

145,545.—Bridge-Column.—JOHN ZELLWEGER, Louisville, Ky. Application filed October 20, 1873.

A bridge post or column in which the main bars or members are connected by one or two flat wrought-iron bars, wound in spiral lines on the inside or outside of the column from one end to the other, and bolted or riveted thereto.

Claim.—The rigid connection of the main-bars A of a built post, brace, or column by means of curved or angular winding truss-bars B, substantially as described.

145,546.—Machine for Shaping Brush-Woods.—JOHN AMES, Jr., Lansingburg, N. Y. Application filed July 5, 1873.

The stock of the brush, being held in a clamp having the proper form, is fed to a rotary spiral cutter, by which the edge is dressed evenly to conform to the "setting" of the bristles.

Claim.—1. The spiral rotary cutter B and clamp, having upper and lower patterns H J, combined in a brush-shaping machine to allow an upward cut, in the manner described.

2. A guard, N, placed over the clamp, as described, to re-enforce it against the upward pressure of the cutter.

145,547.—Window-Screen.—WILLIAM G. ANDERSON, Worcester, Mass. Application filed June 17, 1873.

Claim.—1. The bracket 7, having the flange 8 for fitting in the groove 9, so that it can be moved forward for changing the size of the frame, substantially as shown and described.

2. The adjustable end piece 4, rods 3, springs 2, and slotted guides 6, in combination with the frame 1, substantially as set forth.

145,548.—Combined Lamp-Shade and Drip-Cup.—JAMES S. ATTERBURY and THOMAS B. ATTERBURY, Pittsburg, Pa. Application filed November 14, 1873.

Claim.—A combined drip-cup and lamp-shade, applied around the collar of a lamp, substantially as and for the purpose described.

145,549.—Machine for Preparing Printers' Rules.—JOSEPH B. BANCROFT, Hopedale, Mass. Application filed August 9, 1873.

The straight edge of a semicircular bed-plate and a lever attached thereto form a cutting-shears. Cutting-lever is operated by either of two auxiliary levers. A V-shaped gage—angle, forty-five degrees—is adjustable upon the bed-plate, its point always at the center of the same, and upon each leg of it an adjustable stop. A double clamping-lever operates with the gage upon a pivot well into the angle of it, a handle of said lever extending along the inner side of each leg of the gage, and a clamping-jaw outside of each and near the point. A movable stop adjusted to the under edge of the cutting-lever gages the amount of chip to be cut off in beveling, and, to avoid contact with this in squaring, a parallel is interposed between the rule and the gage.

Claim.—1. The auxiliary lever I and its coupling-hook K, spanner *c'*, and pin *b'*, in combination with the movable cutter-lever D, and the bed A supporting the adjustable miter-gage I', all being substantially as specified.

2. The duplex griper-lever P, provided with two jaws, *f f*, as set forth, in combination with the adjustable miter-gage I', as explained.

3. The adjustable chip-gage M, in combination with the movable cutter-lever D, and the miter-gage I' applied to the table A, as set forth.

4. The movable guard O, combined with the table A, the miter-gage I', and the movable cutter-lever D, all being essentially as specified.

145,550.—Culinary Vessel.—WILLIAM A. BARLOW, Chicago, Ill. Application filed May 19, 1873.

Claim.—A culinary vessel provided with a steam-flue, terminating vertically in the bottom of the vessel, when the said vessel is provided with the disk C arranged horizontally beneath the lower mouth of the said flue, substantially as shown and described, for the purpose of spreading the steam in all directions across the bottom of the vessel and preventing the fire from being deadened by a downward jet, and for the purposes specified.

145,551.—Skate-Fastening.—GEORGE W. BARLOW, New York, N. Y. Application filed November 11, 1873.

The screw for setting the sole-clamps accomplishes the main adjustment by using the lever pivoted thereto either crank or screw-driver fashion, the particular and final clamping being effected by the cam on said lever.

Claim.—The lever *l'* and cam *l*, connected by the fulcrum *e* to the adjusting-screw *i*, in combination with the clamps of the skate-fastening, in the manner and substantially as set forth.

145,552.—Corn-Dropper.—ROBERT M. BOWMAN and WILLIAM H. BOWMAN, London, Ohio. Application filed July 26, 1873.

A sliding valve upon the under side of the seed-slide serves as a bottom to the seed-pocket, and moves with the slide until,

coming in contact with a stop, it is arrested just after the surplus seed has been removed by the cut-off above the pocket now discharging the seed. Upon the return of the seed-slide a spiral spring retracts the valve to its place.

Claim.—The slide-bottom A, having the drop-hole C, combined in a corn-dropper with the auxiliary spring-slide F, the two arranged to operate together in the manner and for the purpose described.

145,553.—Wire-Mattress Frame.—GEORGE V. BUNKER and WILLIAM I. BUNKER, Yankton, Dakota Ter. Application filed April 28, 1873.

At one end of the frame is a movable cross-piece. Bent bolts are inserted in the side rails, and the threaded end of the bolt enters the cross-piece. A nut butts against the cross-piece, and by moving it the tension of the fabric is regulated.

Claim.—A frame composed of two side rails, *a a*, two end rails, *b b*, one cross-piece, *m*, and two set-screws, *c c*, for the purpose of stretching woven-wire mattresses, substantially as described, and for the purposes set forth.

145,554.—Cotton-Seed Planter.—ZERET CARTER, Line Creek, S. C. Application filed August 9, 1873.

In rear of the opener, and rotating within the frame, is a hopper made in the form of two hollow cones, secured to each other at their bases. Around the center of the hopper or reservoir is formed a rim which is notched transversely opposite orifices in the reservoir, the rim preventing the earth from entering the orifices. In rear of the reservoir, and secured in an adjustable frame, are three teeth, the center tooth being a little in advance, for scattering, while the two outside teeth are for covering the seed.

Claim.—The plows L and M, attached to the hinged or rising-and-falling bar K, the former arranged in rear of and laterally from the latter, in combination with the centrally-discharging hopper and the furrow-opener I, all as shown and described, whereby the seed is distributed in the furrow and then covered, as specified.

145,555.—Ruler.—FRANK A. COMBES, Cleveland, Ohio. Application filed February 3, 1873.

Claim.—As a new article of manufacture, the concave ruler A, having its edge *b* bent under and folded to form a groove for the reception of an ink-absorbent, B, and provided with one or more strengthening-ribs, *c*, as shown and described.

145,556.—Button-Holder.—MINOR J. COOPER, New York, N. Y. Application filed July 26, 1873.

The button is held upon the cloth while being sewed onto it.

Claim.—A button-holder consisting of the clasp-plates B C, the plate B being forked and grooved at one end to receive and hold buttons of different sizes, substantially as described.

145,557.—Photographic Background.—ALFRED B. COSTELLO, Jersey City, N. J. Application filed November 11, 1873.

Claim.—The pliable conical background A, in combination with the frames B, D, and F, substantially as and for the purpose hereinbefore set forth.

145,558.—Wash-Boiler.—OSCAR E. CULVER and LEANDER E. MOSELEY, Eagle Bridge, N. Y. Application filed November 1, 1873.

Claim.—In combination with the water circulating and distributing attachment A B F G of a wash-boiler, the valves D hinged at their lower ends to inclined partition-plates C, having passages or openings *c'*, and combined with suitable stops E for limiting the opening movement of the valves, as and for the purpose set forth.

145,559.—Rein-Holder.—LEMUEL FAWCETT, Salem, Ohio. Application filed November 19, 1873.

Claim.—1. The pivoted wing C, in combination with standard A, having concave surface, as shown and described, for the purpose specified.

2. The stud A, on the cone *c'*, for limiting the backward motion of the wing, substantially as shown and described.

3. The combination of the slot b^3, set-screw *d*, and arms a^2 b^2, for regulating the distance between the wing and the concave surface, substantially as shown and described.

145,560.—Medical Compound.—SOLOMON FIELD, Galva, Ill. Application filed November 15, 1873.

Butternut-root bark, sarsaparilla root, sassafras-root bark, wahoo-root bark, dandelion root, mandrake root, wild-cherry bark, white-popple bark, water, alcohol.

Claim.—A medical compound composed of the above-named ingredients, in the proportion given, substantially as and for the purpose specified.

145,561.—Machine for Making Ox-Shoes.—RAYMOND FRENCH, Seymour, Conn. Application filed November 28, 1873.

Two die-wheels, A and B, geared together and rotating horizontally, the former, A, having two dies, the one *c c* for making rights and the other *c' c'* for making lefts, and the latter, B, having a supporting-surface, *g*, upon which the blank rests while being acted on by the creasing and punching die *f*. The position of the die *f* on its shaft is slightly changed, and the dies A and B rotated in the opposite direction, when it is desired to change from rights to lefts, or vice versa.

Claim.—1. In combination with the wheels A B, the shoulder 2, projecting dog *a*, and dies *c c* on former, and the recesses *d* in the latter, for the purpose of holding and bending a blank into shape or form while in a projected position, and allowing the dog to pass, substantially as described.

2. In combination with the shoulder, dog, and dies, for holding the blank in a position projecting beyond the perimeter of the wheel A and with the creasing and punching dies, the table *g* on the wheel B, over and upon which the projecting portion of said blank rests when the creasing and punching die is in contact with it, as described.

3. In combination with the creasing and punching die *f* and its shaft F, the recesses 4 3 in the die, and the stud 5 in the shaft, so that said die may be slightly turned on its shaft and then be firmly held when the rotation of the die-wheels is changed to make rights or lefts, substantially as described.

145,562.—Feed or Sauce.—FRANCIS A. FRISCIA, Brooklyn, N. Y. Application filed December 1, 1873.

Beef, pork, concentrated essence of tomatoes, onions, lard, sherry-wine, tomato-juice, Spanish pimenton, flour, powdered chocolate, spices, pepper, and salt.

Claim.—The sauce or gravy, composed of the ingredients and prepared in the manner substantially as set forth.

145,563.—Traversing Mechanism for Machine-Guns.—RICHARD J. GATLING, Hartford, Conn. Application filed October 25, 1873.

Claim.—1. The grooved cylinder K I^1 I^2, in combination with a guide-pin, H, for controlling the line of fire and the sweep of the gun, substantially as herein shown and described.

2. The combination of an adjustable socket, G, guide-pin H, and grooved cylinder K I^1 I^2, for changing the sweep and line of fire of the gun, substantially as herein shown and described.

3. The flanged, grooved, perforated, and slotted cylinder or bar A, and the adjustable socket G, provided with a nut, F, in combination with the screw D, guide-pin H, and grooved cylinder K I^1 I^2, substantially as herein shown and described, and for the purpose set forth.

145,564.—Culinary Tongs.—ALFRED GREENLEAF, Brooklyn, N. Y. Application filed September 20, 1873.

To a suitable handle two wires are attached by their ends, both being doubled and bent, the upper one with a coil and thumb-piece passing down so as to form a clamp with the one below.

Claim.—A pair of wire tongs, B C, the prong C being the lower, upwardly bent above the other, and provided with thumb-piece D, as described, to enable the end of prong C to be moved to and from that of prong B, in the manner set forth.

145,565.—Bearing for Shafting.—PIERRE J. HARDY, New York, N. Y. Application filed November 14, 1873.

The bearing or box is in two parts, made with complete rings connected to the ends of the lower part, between which rings the upper part of the box is placed, and attached to the lower part by bolts. These rings present a smooth surface for the collars upon the shaft, so that noise and unequal wear are avoided.

Claim.—The bearing for shafts made with the ring-shaped end portions *l* upon the box *a*, between which the box *b* is secured, in the manner and for the purposes set forth.

145,566.—Machine for Removing Snow from Roadways.—GEORGE HART, Tarrytown, N. Y. Application filed November 22, 1873.

The snow is swept upon an endless chain of buckets, which deliver it to slides, conducting it to a tank, where it is melted by steam and furnace heat.

Claim.—1. The machine for removing and melting snow, consisting of engine A' with side casings A, brushes B, endless belts C with buckets C', double-bottomed chutes E', and snow receiving and melting tanks F^1 F^2 F^3, all combined and constructed to operate substantially as and for the purposes described.

2. The casings A, having plow-shaped front connection and inclined curved parts *B'* for taking up the snow from the brushes, as described.

145,567.—Telegraph Transmitter.—DAVIS HERMANN, New York, assignor to CHARLES H. SMITH, Brooklyn, N. Y. Application filed September 24, 1872.

Claim.—The springs *i*, pressed back by the inclined ends of the keys *f*, but allowed to move when the key is depressed, in combination with the revolving metal cylinder *a*, having a non-conducting surface, with openings through the same, as and for the purposes set forth.

145,568.—Heating Air and Supplying Boilers therewith.—GEORGE E. HIBBARD, Fond du Lac, Wis. Application filed May 17, 1873.

Air is pumped into a reservoir, conveyed thence into a coiled heater in the up-take, and passes through the steam-space of the boiler, emptying above the mouth of the pipe leading to the engine.

Claim.—In connection with a locomotive-engine, the heating-coil pipe J and pipe E, having check-valve E', the throttle-pipe J', air-holder A, and air-pump C, all combined, constructed, and operating, as shown and described, for heating and injecting air into the boiler, as specified.

145,569.—Spinning-Mule.—THOMAS HOULDING, Ipswich, Mass. Application filed May 31, 1873.

For keeping the carriage parallel with the roller-beam, the chains being adjustable endwise, so as to move either end of the carriage should it be out of parallelism. The guards prevent the chains rising out of gear with the pinions. The gages indicate when the carriage is "square."

Claim.—1. The combination of the toothed chains D, pinions C, and shaft B with a spinning mule or jack carriage, substantially as specified.

2. The said chains D, arranged adjustably endwise in their supports, substantially as specified.

3. The guards H, combined with the carriage, chains, and pinions, substantially as specified.

4. The gages I, in combination with the carriage, chains, and pinions, substantially as specified.

145,570.—Sewing-Machine.—JAMES A. HOUSE, Bridgeport, Conn., assignor to THE WHEELER AND WILSON MANUFACTURING COMPANY, same place. Application filed November 3, 1873.

A pad formed on the rotating hook clasps the bobbin-thread between itself and an adjustable spring-tension finger just after the loop of needle-thread has passed around and from the bobbin, and holds the bobbin-thread while the stitch is tightened.

Claim.—1. The combination, substantially as set forth, of a presser-bar, a presser-foot pivoted therein, and a locking ring on the presser-bar, whereby the presser-foot, when at work, is locked by the ring, and yet can be turned up out of the way when desired.

2. The combination, substantially as set forth, of a spring tension-finger and a rotating pad on the hook, to lock the bobbin-thread while the stitch is being tightened.

3. The combination, substantially as set forth, of the rotating pad, the tension-finger, and the adjustable spring-lever for varying the tension of the lower thread.

145,571.—Cotton-Worm Destroyer.—JEHU W. JOHNSON, Columbus, Tex. Application filed August 21, 1873.

A force-pump, mounted upon a wheeled vehicle, for throwing poison liquid upon cotton or other worms. To the pump is attached a lead pipe, which extends back in rear of the frame, and to which is attached a series of branch pipes, each consisting of a short conical tube with a lateral connection with the main pipe, the lower end being crimped or corrugated, and provided with an elastic plug, which is adjusted by a screw-rod passing through it, for graduating the flow of liquid.

Claim.—1. The tube H, having its lower end crimped, corrugated, or grooved, and provided with an elastic plug adjusted by means of a screw-rod and nut, substantially as and for the purpose shown and described.

2. The combination, in an apparatus for destroying cotton-worms, of the tank, force-pump, and pipes with the tubes H hereinbefore described, substantially as set forth, all arranged and operating to shower a spray evenly and thoroughly over the rows of cotton-plants.

145,572.—Cotton-Worm Destroyer.—JEHU W. JOHNSON, Columbus, Tex. Application filed October 13, 1873.

A tank is provided with a double-acting force-pump communicating with a discharge-pipe and branches, the pump being connected by a pitman with one of the wheels upon which the tank is supported. The wheels are made unusually small, for giving a rapid action to the pump without the intervention of gears, the frame being supported at the proper height by standards attached to the short axles.

Claim.—1. An apparatus for exterminating cotton-worms, consisting of a tank provided with a double-acting force-pump communicating with a pipe and branches, having the pump connected by a pitman with one of the wheels upon which the tank is supported, combined as shown and described, for the purpose specified.

2. The combination of the cart-bed B, elevating-bars D, wheels C, pitman E, and pump-lever G, as shown and described, for the purpose specified.

145,573.—Grain-Basket.—HORACE C. JONES, Dowagiac, Mich. Application filed December 16, 1872.

An outer series of long staves extends down one side, across the bottom, and up the opposite side. Two series of short staves are used. One of these series forms part of the outer series near the top of the basket. The short staves are tapered at their lower ends, the said tapered ends of one series being under the tapered ends of the other, and the spaces left between the upper portions of the innermost series being closed by the other short series.

Claim.—A stave basket, as herein specified, having an outer series of long staves and two series of short staves, which latter are tapered at their lower termini, the said tapered termini of one series being under the tapered termini of the other, and the spaces left between the upper portions of the innermost series being closed by the other short series, and the whole bound together, substantially as described.

145,574.—Printer's Side-Stick and Quoin.—FRANCIS KEHIN, Milwaukee, Wis. Application filed November 8, 1873.

The side-stick is in wedge-shaped sections, wider in the lower part, which projects about the middle in the form of a step. The quoins have a corresponding projecting top step, and are of the same height as the side-stick.

Claim.—1. A printer's side-stick, produced with alternating wedge-shaped sections and projecting base step, substantially as described.

2. A quoin for locking the side-stick to the forms, being of equal height with the side stick, and of wedge shape, with a projecting top step, as specified.

145,575.—Dropper for Seed-Planter.—HERMANN H. KOELLER, Camp Point, Ill. Application filed September 13, 1873.

Upon a reciprocating bar are cam-shaped projections, which engage with and rotate a star-wheel upon a bolt passing through a slot in the said slide. Upon four arms of the star-wheel are raised projections, fitting into notches in the dropping-wheel, the periphery of which is provided with orifices, through one of which the seed passes at each movement of the disk, a guard-plate above serving to remove the surplus seed. To the bottom is pivoted an arm, which works in a slot in the cam-slide, and to which is attached a pivoted cut-off in the conductor-spout, for detaining each successive charge of seed.

Claim.—1. The combination of the sliding bar C, beveled or wedge blocks F, the star-wheel E *e'*, and the perforated ring dropping-wheel G, having notches *g'*, as shown and described, for the purposes specified.

2. The combination of the pivoted bar or plate N, connecting-bar M, and projections L with the bar, arranged to reciprocate and operate the seed-delivery mechanism.

145,576.—Coffee-Roaster.—WILLIAM J. LANE, Millbrook, New York, assignor to himself and JOHN G. LANE, same place. Application filed October 18, 1873.

The revolving cylinder is journaled in side pieces or brackets attached at right angles to a pivoted side of the main inclosing-drum. This side can be swung outward, and carries with it the cylinder. When it is swung back to position the crank-end of the cylinder-axis is received in a suitable slot in the end of the main drum.

Claim.—1. A coffee-roaster, A B, and cylinder G, having a hinged side, D, constructed and limited in its movement by joint-straps F F as described, whereby the cylinder and side of case are withdrawn by a single movement, for discharging and refilling.

2. The cylinder G, journaled in a pivoted case-side, D, as and for the purpose described.

145,577.—Device for Cleaning Steam-Generators.—DAVID L. LATOURETTE, New York, N. Y. Application filed June 21, 1873.

Steam or other fluid is forced through the boiler by a forcing apparatus, connected by suitable pipes to the boiler, and forces the mud and sediment out. The pipes are provided with suitable cocks or valves.

Claim.—A steam-boiler, A, provided with inlet and discharge pipe connections B and C applied thereto, and having cocks G H, as shown and described, so that said boiler may be connected with a forcing apparatus, and a current of steam or other fluid forced through it from one end to the other, thus removing and washing out the mud or sediment, as set forth.

145,578.—Hand-Punch for Metal.—SAMUEL FREDERICK LEACH, Chelsea, Mass. Application filed December 2, 1873.

Claim.—The combination and arrangement of the standard B and platform A, the cam-lever C E, and the second lever J, with the connecting-loops H and L, and the plunger M, all when constructed and arranged substantially as described.

145,579.—Stove-Pipe Thimble.—NICHOLAS LINDEN, Chicago, Ill. Application filed November 13, 1873.

The part A and its tongues are of but a single piece of metal.

Claim.—The annular sheet-metal disk A, having a central opening cut therein to receive the pipe, in combination with the cylindrical piece B, arranged between the outer and inner rims of the said disk, and attached to the inner face of the latter by means of the radial tongues *a a* cut from the central part of said disk, and bent to receive the pipe and clasp the inner edge of the part B, substantially as shown and described, and for the purposes set forth.

145,580.—Flux for Treating Ores and Metals.—PATRICK N. MACKAY, San Francisco, Cal. Application filed November 18, 1873.

Claim.—A flux or refining-compound, composed of borax, or any of the borates, or crude borax, with silica in the form of infusorial earth or silicious diatoms, and chloride of sodium, substantially as herein set forth.

145,581.—Preserving Green Corn and other Vegetables.—G. LEWIS MERRILL and OSCAR F. SOULE, Syracuse, N. Y. Application filed September 26, 1873.

Claim.—1. The above-described method of cooking and preserving green corn and other vegetables by steam applied directly into the cooking-chamber and outside thereof, substantially in the manner described.

2. The cooking-chamber A, when arranged and operated substantially as described, for the purpose of cooking green corn and other vegetables.

3. The cooking-chamber A, arranged and operated as aforesaid, when combined with the shaft S, provided with a spiral and teeth, or their equivalent, substantially in the manner described.

4. The combination of the cooking-chamber A, cylinder B, and shaft S, with its spiral and teeth, as above described.

5. The combination of the cooking-chamber A, cylinder B, and shaft S, with its spiral and teeth aforesaid, with the canning apparatus *x o* E, substantially as above set forth.

145,582.—Book-Clamp.—WILLIAM A. MILLER, Paterson, N. J. Application filed September 27, 1873.

Claim.—A book-clamp, consisting of a base-plate, B, a fastening-strap, C, buckle D, and a hinged tightening-lever, E, combined as described.

145,583.—Station-Indicator.—JOHN W. NEWLIN and JACOB S. SHERMERMAN, Millville, N. J. Application filed October 4, 1873.

In the upper part of the case, inclining toward a glazed slot in the front, are affixed supports C *c'*, upon which are hung rabbeted and slotted strips bearing the names of stations. The strips are, through levers G H and cord K, pressed aside so that the slots b^2 allow them to fall upon supports D, inclined toward the back in the bottom of the case.

Claim.—1. The combination of the strips B, having slots b^2 and notches b^1, with the upper strips C *c'* and the lower inclined strips D, all as shown and described, to operate as specified.

2. The combination of the shaft E, arms G H, and spring O with the strips B b^1 b^2 and box A *c'*, substantially as herein shown and described.

145,584.—Car-Coupling.—WALTER B. MITCHELL, Chicago, Ill. Application filed June 21, 1873.

Claim.—1. The coupling-hook A, having a link projecting from its rear, and capable of attachment to the draw-head B, as set forth.

2. The combination of the coupling-hook A, chain *e*, shaft C, and pawl D, as and for the purpose set forth.

145,585.—Tree-Protector.—JONATHAN NEFF, Dallastown, Pa. Application filed December 5, 1873.

A tree-box constructed of three fixed sides, with the fourth removably attached. To the bottom of the box are secured adjustable props for holding the box at a proper distance from the earth.

Claim.—A tree-protector constructed with fixed sides A A A, a removable side, B, and adjusting-props C C C, combined and operating together substantially as and for the purposes herein specified.

145,586.—Water-Closet.—JOHN F. NEILSON, New York, N. Y. Application filed August 4, 1873.

On the rod of the lift-valve is a disk, which serves both as a guide and as a means to lift the valve when pressed by the water, thus preventing overflow.

Claim.—The combination, with a lift-valve and water-chamber, B, pipe E, and basin F, of the disk G', placed on the same rod as the valve, and not only serving as a guide, but lifting the latter when itself pressed by the water, thus providing an outlet for any surplus of water and entirely precluding the possibility of an overflow.

145,587.—Machine for Making Clothes-Pins.—BENJAMIN B. OCKINGTON and ANDREW J. OCKINGTON, Stratford Hollow, N. H. Application filed November 1, 1873.

All the operations of turning, cutting off, and slotting are performed consecutively by this machine.

Claim.—1. The combination of the feeding-rollers A, turning-mandrel C, pressure-rollers E, cut-off saw T, carrying-wheel V, and slotting-saw W, substantially as specified.

2. The cam P and elbow-lever O, combined with the wedge-moving slide M and the intermittingly-revolving feed-rollers, and arranged to cause the finishing-cutter to act while the feed-rollers rest, substantially as specified.

3. The arrangement of the cam P and elbow-lever O relatively to the feed-rollers, to allow the spring N to raise the finishing-cutter off from the work previous to the starting of the feed-rollers, substantially as specified.

4. The combination of the guides *j* with the slotting-saw, substantially as specified.

145,588.—Car-Mat.—JOHN O'NEILL, Brooklyn, N. Y. Application filed August 23, 1873.

Slats of wood are arranged in groups at right angles to each other.

Claim.—A sectional car-mat formed of slats or bars, arranged in groups at right angles with each other, as herein shown and described, and for the purpose set forth.

145,589.—Boot.—GEORGE C. PARKER, Worcester, Mass. Application filed June 17, 1873.

The strap is first stitched by its upper end to the inside of the boot-leg, then turned over the top, passed a proper distance down the outside, and its lower end returned through a slit in the leg to the interior, and there sewed.

Claim.—The combination, with the upper part of a boot-leg of a boot, of a strap, C, the ends *a b* of the strap being applied to the boot-leg and stitched separately to distinct and independent parts of the inside of said leg, as and for the purposes shown and set forth.

145,590.—Boot and Shoe Tip.—FREDERIC W. RHINELANDER, New York, N. Y. Application filed November 26, 1873.

A coating of composition consisting of sand, oxide of lead, carbonate soda, and borax, mixed in alcohol, is spread upon the surface of the top, and when dry is subjected to a dull red heat.

Claim.—The enameled-metal shoe-tip, as a new article of manufacture.

145,591.—Feed-Water Heater.—GEORGE W. RICHARDSON, Troy, N. Y., assignor to BENJAMIN STARBUCK and GEO. H. STARBUCK, same place. Application filed September 29, 1873.

Claim.—1. In a feed-water heater, the series of annular hollow rings B, between each two of which are the solid bossed support E and the hollow or tubular bossed support D, arranged to alternate from top to bottom of the series of rings, by which the water is made to circulate around through the annular rings, as specified.

2. In a feed-water heater composed of case A and hollow rings B, the depressions X in the rings, to allow of the insertion of the pipe G between the rings and casings, as and for the purpose set forth.

3. As an article of manufacture, the herein-described feed-water heater, consisting of casing A, inlet-ports A' A'', and hollow rings B, having cup-joints and bosses packed, as shown, and secured by rods and nuts C, and having inlet and outlet pipes F G, all constructed, arranged, and operating substantially as described.

145,592.—Churn-Dasher.—HERNDON B. ROBINSON, Birmingham, Ala. Application filed August 16, 1873.

Four perforated disks are arranged upon a vertical shaft, with concavities of the upper and lower ones in opposite directions, and the middle ones facing each other.

Claim.—The four perforated disks A, the upper and lower having their concavities in opposite directions, while the concavities of the middle ones face each other, and all attached to a rod, B, to serve in the manner described as a churn-dasher.

145,593.—Machine for Planing the Edges of Sheet Metal.—GREENLEAF B. RUNDLETT, South New Market, N. H., assignor to SWAMSCOT MACHINE COMPANY, same place. Application filed November 13, 1873.

The carriage E is situated upon ways, and traversed from one end of the frame to the other by a screw, I. An adjustable slide, C, on the top of the carriage bears a holder, B, pivoted near the center, in the end of which the double-edged cutter is placed. The sheets of metal to be planed are held firmly by clamps, and the carriage caused to traverse across the ends, carrying with it the cutter, which is vibrated from one side to the other, the holder bearing against abutments on the slide C.

Claim.—The double-edged cutter A, the stops or abutments *f g*, and the vibratory cutter-carrier B, arranged and combined, essentially as set forth, with the carriages C and E, applied together and to the frame H in manner and to operate substantially as specified.

145,594.—Wagon-Standard.—CYRUS W. SALADEE, Pittsburg, Pa. Application filed November 28, 1873.

Claim.—In combination with the body A, standards C, and ends of the bolster B, the spring E, substantially as and for the purpose set forth.

145,595.—Adjustable Reclining-Chair.—GEORGE A. SCHAEFER, New York, N. Y. Application filed July 10, 1873.

The arms of the chair slide on the upright supports, and are connected to the hinged back by links. The arm-rests are held in position by spring-bolts. A spring is inclosed between each rear support and a portion of the arm to return the back to the upright position. The foot-rest is also connected by rods with the hinged back, and a spring on each rod also aids in returning the back to the upright position.

Claim.—1. The combination of the movable arms B, supporting-posts A^1 A^2, springs C, links D, and hinged back E *e*, as and for the purposes specified.

2. The sliding rod H and spring *h*, in combination with the hinged back E *e* and foot G, and arranged to serve therewith, as herein specified.

145,596.—Spark-Arrester.—JOHN W. SEIGH, Johnstown, Pa. Application filed December 5, 1873.

An inverted cone within the smoke-stack is made adjustable by means of slotted braces. Said cone is perforated for the passage of fine dust and smoke, and is provided with a tapering curved ring, also perforated, against which the sparks are deflected to a perforated ring secured to the inside of the top of said smoke-stack. By these means the draft is regulated and the sparks retained until sufficiently pulverized to pass through the perforations.

Claim.—1. The combination of the cone *c*, ring A, and slotted braces *e*, substantially as specified.

2. The combination of the stack *a*, cone *c*, rings A *l n*, and standards *e*, substantially as shown and described.

145,597.—Spring-Mattress.—DAVID N. SELLIG, Newburg, N. Y. Application filed October 17, 1873.

Spiral springs of the form of a double cone, connected at their vertexes, support at such connection a central and horizontal frame inside the mattress. Longitudinal projections of sacking, of the full depth, divide the series of springs.

Claim.—A mattress having the sacking a divided into compartments by the strips *e*, which are fastened to the wooden frame *d d* in the center, to prevent the sagging of the springs *g* down between the slats, substantially as shown and described.

145,598.—Numbering-Machine.—JAMES D. SMITH, Washington, D. C. Application filed October 2, 1873.

The pull-down disk is partially cut away, and is provided with a cap, E, and a spring-catch which takes hold of the type-disk and draws it around. The locking-pin is held in an adjustable bearing, by means of which the distance the pin reaches toward the center is regulated.

Claim.—1. In a numbering-machine having a yoke with rotating disks mounted therein, the cap E, with its spring-latch b, adapted to take hold of the type of the actuating-disk, and operating in the manner and for the purpose set forth.

2. The locking-pin F, constructed substantially as described, and adapted to lock any one or more of the numbering-disks in a given position, for the purpose set forth.

145,599.—Device for Converting Motion.—JOSEPH P. TAYLOR, Hudson City, N. J. Application filed October 25, 1873.

A ratchet-wheel, secured to a shaft, is arranged within an open oval frame of a pendulum-lever. This frame is slotted, and two weighted ratchet-pawls are pivoted to the same, one above and the other below the ratchet-wheel. When the lever is moved to its limit the pawls are disengaged from the ratchet-wheel by means of a weighted lever bearing upon the points of the ratchet-pawls.

Claim.—An apparatus, composed of the pendulum-lever A with the frame C, ratchet G, and rotating wheel H, pawls I and J, weights L and M, and cords P P, all combined to operate substantially as and for the purposes described.

145,600.—Car-Starter.—JUSTIN G. THOMPSON, Stockton, N. Y., assignor of one-half his right to FREDERICK M. BRIGGS, same place. Application filed May 20, 1873.

Clutch-boxes upon the axle are thrown in and out by a slotted block operated, by a windlass, from the car-platform. The spiral spring is used to start the car in either direction, being wound up, in the one case, by revolving the drum to which its inner end is fastened, and, in the other, by the revolution of the cylinder to which its outer end is attached.

Claim.—1. The combination of the coil-spring A, barrel B, hollow cylinder C, hollow cylinders D and D', and the axle H, substantially as and for the purpose set forth.

2. The combination of the coil-spring A, the hollow cylinder C with its ratchet *d*, the hollow cylinder D', and the dog *e*, substantially as and for the purpose set forth.

3. The combination of the double-slotted wedge I, collars *a* and *a'*, pins *b* and *b'*, and friction-rollers *c* and *c'*, substantially as and for the purpose set forth.

4. The combination, with the coil-spring A, barrel B, hollow cylinder C, and the hollow cylinders D and D', of the clutches *m* and *m'* and E and E', substantially as and for the purpose set forth.

5. The combination of the slotted wedges G and G'', pawls F and F', ratchets *r* and *r'*, and the flanges h h and h' h', substantially as and for the purposes set forth.

6. The combination, with the double-slotted wedge I, of the chain *i*, pulley L, crown-wheel M, dog P, spiral spring *s*, button *v*, and shaft Q, substantially as and for the purpose set forth.

7. The combination of the lever X, step W, spring *x*, and the slotted wedge G, substantially as and for the purpose set forth.

145,601.—Drop-Hammer.—JEREMIAH TOBIN, Newark, N. J. Application filed July 15, 1873.

A screw-rod attached to the hammer passes through two springs and a stationary cross-piece, X, between them, and is provided with two screw-nuts, one above and the other below the springs. The upper spring limits the descent of the hammer, and the lower spring increases the force of the blow, the nuts on the screw-rod furnishing the means for adjustment.

Claim.—1. The combination of the hammer C, screw-rod Y, spring 2, and nut 3, substantially as shown and described.

2. The hammer C, screw-rod Y, springs 1 2, stationary cross-piece X, and regulating-nuts 3 4, combined for operation substantially as set forth.

3. The combination of the tappet-wheel B, hammer C, screw-rod Y, springs 1 2, nuts 3 4, bar X, and an anvil, substantially as shown.

145,602.—Washing-Machine.—JOHN W. TULL and JAMES W. WESTON, Windsor, Ill. Application filed August 16, 1873.

Attached to the bed-piece of the roller-frame is a sliding extension-piece, both being provided with pins to enter the sides of a tub. A cam and lever adjust the sliding piece.

Claim.—The slotted and sliding extension-piece B and cam-lever D, in combination with the bed-piece A and pins C, as and for the purpose specified.

145,603.—Process of Amalgamating Gold and Silver. JOHN TUNBRIDGE, Newark, N. J. Application filed November 10, 1873.

Claim.—1. The vessels B B', filled with submerged amalgamated pieces of metal, substantially as set forth.

2. Two or more vessels, having perforated bottoms, and filled with amalgamated strips or pieces of metal, which are submerged in the water of the reservoir, the vessels being arranged so that the washings or lama may be passed alternately through them, substantially as shown and described.

3. The reservoir A, in combination with the vessels B B' and tap E, substantially as described, for the purpose set forth.

145,604.—Carpet Stretcher and Tacker.—ZADOCK A. WARD, Pittsfield, Mass. Application filed August 16, 1873.

The handle has a recess to receive the U-shaped tacks, which are fed forward by a spring-follower into a T-shaped recess in the lower end of the toothed guide-piece. Said guide-piece carries a spring-bolt, which is forced down upon the tack by a hammer attached to the handle of the device.

Claim.—The handle A, provided with the recess to receive the U-shaped tack, the spring-conductor F, the guide-piece B, armed with teeth *a*, and having a T-shaped recess in its lower end, the spring-bolt E of corresponding form, the hammer D, with curved pivoted arm or lever *e*, and operating device *e f*, all operating as shown and described.

145,605.—Brake-Beam for Cars.—DANIEL WELLINGTON, Virginia City, Nev. Application filed March 16, 1872.

The brake-beam is formed of wrought-iron bars, which are so combined that when secured to the cast-iron brake-heads they will be securely braced against the strain.

Claim.—1. In combination with the brake-head B, and detachably secured thereto, the straight rods A A and arch-rod C, substantially as and for the purpose set forth.

2. The straight wrought-iron rods A, and wrought-iron bracing-rod C, in combination with the barrel E, with its lugs h, substantially as and for the purpose described.

145,606.—Lithographic Transferred Print.—OTTO P. WOLFF, Cincinnati, Ohio, assignor to STROWBRIDGE & CO., same place. Application filed October 29, 1873.

A transparent solution or coating of white lac is interposed between the gummed surface of the transfer-paper and the imprint.

Claim.—As a new and improved article of manufacture, lithographic pictures or prints of any design or pattern transferred onto glass, canvas, or other suitable material having a transparent solution of white lac, employed substantially as described.

145,607.—Manufacture of Bitartrate of Potassa.—LOUIS ADLER, Baltimore, Md. Application filed November 18, 1873.

Take the refuse matter of grapes; add a quantity of water sufficient to form a paste; boil until somewhat thickened, when the liquid is drawn off into any suitable vessel; then introduce a quantity of switches, rods, or withes in such position that they will extend to every part of the liquid. These rods are left in the liquid until the bitartrate of potassa contained in solution therein is precipitated or deposited upon them, when they may be withdrawn, and the bitartrate of potassa may be removed.

Claim.—The process of procuring bitartrate of potassa, substantially as herein described.

145,608.—Furnace-Door.—DAVID AULD, Jr., Glasgow, North Britain. Application filed May 6, 1873.

The air-regulator B, which is inverted by the opening of the door, is, on the closing of the door, gradually brought again into its original position as the sand falls slowly back into the lower part of the box C.

Claim.—1. A door for furnaces provided with a damper and with a sand-box connected to the damper, and closing the same as the sand descends in the box, for the purpose specified.

2. The combination of an inclined bar and rod with the door, damper, and sand-box, as and for the purpose described.

145,609.—Wash-Stand Faucet.—WILLIAM S. BATE, Philadelphia, Pa. Application filed October 18, 1873.

A swivel-spout is provided with recesses, which, by turning said swivel in certain positions, are made to correspond with the exit-port of either the hot or cold water pipes within the stem of the faucet, or of both. In certain other positions of the swivel one of the said exit-orifices in the stem is brought opposite a tube connected with a shampooing apparatus. By a slight variation of said swivel, a mixture of hot and cold water can be conducted to the shampooing apparatus by bringing the exit-orifice opposite both the pipes.

Claim.—1. The combination, in a wash stand faucet, of a stem, A, having two supply-passages, h and *i*, and a swivel-spout, B, which may be brought into communication with either or both of said passages, substantially as set forth.

2. The combination of the swivel-spout B, and its recess *f*, with the fixed stem A, having one or more supply-passages, and an outlet-passage, *k*, all substantially as and for the purpose specified.

145,610.—Copper-Plate Printing-Press.—THOMAS S. BATES, Boston, Mass. Application filed August 4, 1873.

On one end of the cylinder-shaft is a collar, O, provided with a slotted plate, P, one end of which is turned up to form a stop, *p*, the position of which is adjusted relative to the flattened surface of the D-shaped cylinder, that the revolution of the cylinder may correspond to the length of the plate. The back of a projection, *b*, on an adjustable collar at the other end of the cylinder, engages with an adjustable wedge on the bed. Immediately after, the rounded surface of the cylinder leaves the plate and the flattened portion is brought directly over it, when a pawl, *q*, kept in constant contact with the collar O by a spiral spring, *r*, drops into a notch, *s*, in the collar, and holds the cylinder out of contact with the plate, when the table with the plate is thrown back to its original position by a spiral spring, *t*, on guide-rod *k*, placed under the bed, and the movement of the table brings a projection, *t*, against the pawl and throws it out of the notch. The cylinder is thus turned a partial revolution by the recoil of a spiral spring, *u*, connected by a cord with the end of the cylinder, till the stop *p* strikes the pawl *q* and prevents further turning, the extent of the partial revolution being just that sufficient to return the cylinder to the exact position it had before, and ready to set on the plate again.

Claim.—In a plate-printing press, the combination of the D-shaped cylinder C, adjustable collar I, adjustable stop *p*, projection *b*, and wedge L, constructed and operating substantially as and for the purpose set forth.

145,611.—Elevating and Transferring Apparatus of Railroad-Cars.—WILLIAM T. BEKEMAN, Petersburg, Ill. Application filed November 1, 1873.

The cars are elevated by hoisting devices till their wheels clear the track, and, thus suspended, are moved laterally by a traveling carriage to the other track.

Claim.—1. The combination, with a wheeled frame for spanning two or more railway-tracks, of a carriage provided with lifting-rods and gearing and windlass-shafts for hoisting cars, car-bodies, or sections thereof, and a track or ways, L L, for the carriage, arranged on said wheeled frame obliquely, or at right angles to the tracks, substantially as shown and described, to operate as specified.

2. The combination of the chains and chain wheels or pulleys with the wheels J, truss A, and gearing connected therewith, for moving the truck on the track B, as shown and described.

3. The combination of the swing-beam *x*, crabs C, chains *y*, clevises *w*, screw-shafts *v*, radial shafts Q, master-wheel M, and carriage K, arranged as shown and described, to operate as specified.

4. The combination, with the swing-beams, of the shaft Z, chains or cords A, having crabs or hooks attached and passing over pulleys, as shown and described.

5. The combination, with the wheeled truck-frame A, of the rack *m*, wheel *n*, carriage K, and ways L, arranged at right angles to the rails B, as and for the purpose specified.

6. The swing-beams *x x*, provided with adjustable or notched bearing at their ends, to adapt the pulleys or chains for suspending cars or car-sections, to be shifted toward or from each other, corresponding to the size of car or car-section, as specified.

145,612.—Sewing-Machine Table.—JOSEPH BENNOR, Philadelphia, Pa., assignor to HERBIT D. STOOPS and JOHN B. MYERS, same place. Application filed October 18, 1873.

When the cover is used as an extension it is held securely to the table by an eccentric lever, having a knife-edge and an upright rim or flange. The lever is pivoted to the under side of the table-top.

Claim.—The lever G, having an eccentric or inclined surface, *e*, and knife-edge *g*, in combination with the table-top A and cover B, substantially in the manner and for the purpose above described.

145,613.—Fiber-Disintegrator.—ANTOINE BERTHET and PIERRE LAMBEIN, New Orleans, La., assignors of one-fourth their right to DENIS P. WHITE, same place. Application filed June 4, 1873.

At each end of a platform two horizontal rollers are arranged, one obliquely above the other, and each carrying upon its surface oblique sectional blades. A double-grooved wheel, of perpendicular axis, presents its periphery close to the point of contact of these wheels at each end. A belt, passing around both wheels, has intermediate regulating-pulleys. The plant is fed into the grooves and held by the band, is then drawn by the roller-blades, and, finally, dropped on the side of the wheel opposite the feeder.

Claim.—The obliquely-bladed rolls B, the double-grooved wheels O O', and the rope J, combined in a ramie-machine, to operate in the manner and for the purpose specified.

145,614.—Ironing-Table.—CORNELIUS BLOM, JR., Grand Haven, Mich., assignor of one-half his right to THOMAS J. TUBBS, same place. Application filed October 18, 1873.

The ironing-board is intended to be attached to a wall by hooks at one end. Braces are pivoted at each end. The lower end of one, by means of a cross-bar, moves in slots in the other, so that the table can be folded.

Claim.—The ironing-board A having the hinged obliquely-slotted legs B, the pivoted prop D having the horizontal cross-bar *d* with rounded ends sliding in the slots *c* of said legs, said slots being of proper length to allow the legs and prop to be folded closely up against the board, and, when down, to take a bracing position nearly rectangular with each other, substantially as specified.

145,615.—Machine for Making Batting.—FRANCIS W. BLODGOOD, New York, N. Y. Application filed October 30, 1873.

For making batting composed of two sheets or laps of picked and scutched cotton placed one above the other and united by size.

Claim.—The lappers and pickers A and B, with their delivery ends adjacent and opposite, in combination with the sizing and uniting rolls, located and arranged as described.

145,616.—Weather-Strip.—OLIVER W. BOOTH, Providence, R. I. Application filed July 3, 1873.

A weather-strip of the class in which a vertically sliding strip is depressed by a laterally-moving cam operated by the jamb when the door is closed. The operating-piece is made reversible, in this case, so that the strip can be applied equally well to right or left hand doors.

Claim.—The combination of a vertically-operating weather-strip and its supporting-spring with the reversible actuating-bolt, provided with an inclined face at its inner end, substantially as described, and arranged to engage with and depress the strip, as and for the purposes specified.

145,617.—Rotary Pump or Blower.—ABEL BREAR, Saugatuck, Conn., assignor to himself and WILLIAM W. W. WOOD, Washington, D. C. Application filed November 15, 1873.

To the arms of a shaft, placed eccentrically within the case, are pivoted peculiarly-constructed vanes, which are held against the case by springs. The inlet and outlet openings communicate with the spaces between the vanes by ports grooved in the opposite ends of the case.

Claim.—1. A rotary pump or blower in which are combined a cylinder, D, having ports *p* and *q*, communicating with inlet and outlet openings, and a series of valve-like vanes, A, hinged to the arms *a* of a shaft, B, which is arranged eccentrically in respect to the said cylinder, all substantially as specified.

2. The valve-like vane A, constructed substantially as described, with center and cheek pieces *t* and *v*, in combination with the recessed arm *a*, to which the said vane is hinged, all as and for the purpose set forth.

145,618.—Tumbler for Permutation-Locks.—EDWARD W. BRETTELL, New Haven, Conn. Application filed May 3, 1873.

Claim.—A lock-tumbler consisting of a central part, A, provided with a serrated periphery and orifice, *d*, and an elastic stopping, B, having serrated bearings *a a'* and smooth bearing *b*, all combined and arranged as and for the purpose specified.

145,619.—Tool for Molding Inkstands.—ALEXANDER W. BRINKERHOFF, Upper Sandusky, Ohio. Application filed November 15, 1873.

Claim.—The former or molding-tool consisting of the concave cone C, a circular shoulder, *g*, and a point, *h*, formed on a handle or stock, B, for the purposes described.

145,620.—Manufacture of Paper-Pulp.—CHARLES D. BROWN and ELIAS B. DENISON, Portland, Me. Application filed December 9, 1873.

Claim.—1. The process of making paper-stock by grinding together and combining resinous wood and white non-resinous wood, the resinous wood to yield the necessary sizing, and the white wood to give the stock tone or color, substantially as described.

2. Box-board made of pulp or stock from resinous woods combined with pulp or stock from white non-resinous woods, substantially as specified.

145,621.—Chimney-Top.—JAMES C. H. BROWN, Jersey City, N. J. Application filed September 2, 1873.

In whatever direction the wind may be, the currents entering at one side are immediately discharged at the opposite side.

Claim.—A chimney-cap of star-shape in section, having its points radiating from the chimney-flue and contracted toward their outer ends, substantially as and for the purpose shown and described.

145,622.—Music-Blackboard.—OBADIAH B. BROWN and HENRY G. CAREY, Malden, Mass. Application filed June 5, 1873.

The board inclines slightly backward, and the characters used—notes, bars, rests, &c.—are adjusted in or removed from grooves representing the lines and spaces, at pleasure.

Claim.—1. The board A, provided with horizontal grooves *b c* for holding in place musical characters, the grooves *b* being of the same color as the board, and the grooves *c* of a different color to represent the staff, substantially as shown and described.

2. Musical characters formed of wood in two or more thicknesses, with the grain crossed to prevent warping, and provided with pins or projections for engagement with the grooves in the board, substantially as shown and described.

3. The box L, serving as a receptacle for the characters, and hinged to the lower portion of the board A, so as to be turned up and fastened when not in use, substantially as shown and described.

4. A music-blackboard provided with tapering cleats H for effecting the backward inclination of the board, substantially as shown and described.

5. A clef made of thin wood and secured to the board by gluing, substantially as shown and described.

145,623.—Device for Removing Snow from Railways.—JANE ANN BRYANT, Pottsville, Pa. Application filed November 12, 1873.

The wheel is attached to the front of a locomotive, and rotated by gearing connected with the axle.

Claim.—The snow-wheel consisting of the base *b*, rim *c*, paddles *e*, spokes *e*, and socket *d*, constructed as described, for the purpose set forth.

145,624.—Butter-Worker.—SIMEON H. BUSH, Bolstfort, Wash. Ter. Application filed August 30, 1873.

A deep trough is closed by a block, concave inside. A lever, fulcrumed behind this block, and extending to the other end of the trough for the right hand of the operator, carries a loosely-pivoted block, convex toward the fixed concave. A similar unattached convex block, for the left hand, having an extended handle, remains in position at the open end of the trough.

Claim.—The improved butter-worker described, consisting of the inclined concave B, cheeks A A, pressing-head C on the pivoted lever D, and the pressing-head J, all operating in the manner described.

145,625.—Machine for Breasting the Heels of Boots and Shoes.—WILLIAM C. BUTLER, Baltimore, Md. Application filed August 26, 1873.

Claim.—1. The sliding cross-head C and knife D, and the self-adjusting stop E, as relatively arranged, the stop being adapted to control the movement of the knife, and to be raised at the termination of the stroke of the knife with the said knife, substantially as herein set forth.

2. In combination with the cross-head C and self-adjusting stop E, the spring-latch *b*, substantially as and for the purpose specified.

145,626.—Self-Closing Hatchway.—WILLIAM P. CHERRINGTON, Boston, assignor to himself, WILLIAM B. FOSTER, Medford, and WILLIAM A. MORRISON, Cambridge, Mass. Application filed March 27, 1873.

The elevator-car, in its descent, encounters the rounded portion of the link, the upper end of which is girded in the slot K. The motion is transmitted through the link and right-angles arm E to the trap-door, thereby opening it for the passage of the car. The device claimed in the second clause is a pair of slides arranged to close together when the trap-door falls into place, thus closing the slot through which the rope passes and cutting off the draft.

Claim.—1. The combination of the lever L and its wheel W, cam K, and the elbow or brace E upon the door or hatch, the combination being and operating substantially as and for the purpose set forth.

2. The combination, with the door, of the slides S S, arms T T, diagonally jointed to the slides and door, and the springs U U, substantially as and for the purpose set forth.

3. The door or hatch provided with the slides and diagonal arms T, for the purpose set forth, and also connected, by its brace E, to the lever L and cam K, substantially as and for the purpose set forth.

145,627.—Plow.—CORNELIUS M. CLARK, Seward, Neb. Application filed September 27, 1873.

To a widened portion of the beam-standards, rising from a horizontal portion, are attached a cutting-share—being fixed to the front by rivets, clamps, and keys—and a sod-turner extending to the rear from the base-plate. The side-cutting portions are inclined or flaring.

Claim.—The standard portion C, having attached thereto the share C', with inclined sides, and the mold-board turner G, extending slightly over the rear edge of share C', combined substantially as shown, and for the purpose specified.

145,628.—Saw-Handle.—WILLIAM CLEMSON, Middletown, N. Y. Application filed November 26, 1873.

The handle is provided with a central opening and two projecting ends, which enable the operator to use both hands in working with the saw.

Claim.—As a new article of manufacture, the handle formed in one solid piece, having bulge B, with slit for the saw, the central opening A, and the handles C C at each end, all constructed in the peculiar form shown, and for the purpose specified.

145,629.—Cotton and Hay Press.—EDWIN S. COLLINS, Trenton, Tenn. Application filed May 31, 1873.

The slotted packing-box has two doors hinged to the sides of the box for the removal of the bale, and a series of sliding doors transversely arranged, which, as the lever descends, are successively drawn out to permit the lever to pass.

Claim.—1. The horizontally-slotted bale or packing-box E, provided with hinged doors D and draw or sliding doors G, substantially as and for the purposes herein set forth.

2. The combination of the slotted box E with doors D G, screw I, double nut K, lever L with fulcrum M, collar N, and fulcrums O *b d*, all constructed and arranged substantially as and for the purposes herein set forth.

145,630.—Rail for Sliding Doors.—JOHN COLLINS, Hoboken township, Bergen county, N. J., assignor to HOPKINS AND DICKINSON MANUFACTURING COMPANY. Application filed October 11, 1873.

Claim.—A sectional rail the sections of which are formed with correspondingly-shaped legs and cavities, the former serving the double function of dowel or interlocking pins between the sections, and a means of secret or hidden attachment of the sections to the floor, as hereinbefore set forth.

145,631.—Plug or Ferrule for Stopping Leaks in the Tubes of Steam-Boilers.—ROBERT A. COPELAND, Brooklyn, assignor to BENJAMIN COLLINS, New York, N. Y. Application filed October 24, 1873.

Within the recesses arranged in the sides of the plug or ferrule screw-threaded dies are placed; said dies cutting their own way upon the entrance of the plug or ferrule into the tube.

Claim.—A plug or ferrule provided with recesses A A in its exterior surface, in combination with the screw-threaded dies B B, placed in said recesses, substantially as and for the purposes herein set forth.

145,632.—Center Drop-Light.—CHARLES DRAVA, New York, N. Y., assignor to THE ARCHER AND PANCOAST MANUFACTURING COMPANY, same place. Application filed February 6, 1872.

The spring-drum is placed horizontally and axled on the main pipe of the gasalier. It is also placed below the main gas-distributer.

Claim.—The combination in a gasalier of the following elements: A horizontal spring-drum, G, guide-rollers *a a*, inclosing-case E, cords S S, main stem A, distributer B, stationary branch-light ducts D D, and drop-light duct L, substantially as herein specified.

145,633.—Die for Forming Ox-Shoes.—JOHN DENBLE, Plantsville, Conn., assignor of three-fourths his right to THE ATWATER MANUFACTURING COMPANY, same place. Application filed November 22, 1873.

A blanking-die for cutting a plain L-shaped blank; another for bending this blank edgewise; a third for forming the heel and toe calks; and, lastly, one for finishing by creasing and punching.

Claim.—The series of dies A C E L, as herein described, for the manufacture of ox-shoes.

145,634.—Bee-Hive.—LEANDER J. DENZ, Butler, Ind. Application filed May 17, 1873.

The frames are hinged at their upper and lower corners to one side of the hive and on the opposite side rest on a horizontal ledge. Set-screws, in their free ends and lateral thereto, keep space between them and the hive. The door presses them toward the far end, a right-angle flange on the latch-end of the door passing between the hive and the ends of the first frames.

Claim.—The frames D, hinged at their corners to the hive and provided with screws G J, in combination with the flange I of the door B, and of ledge K, to prevent sagging of the comb-frames, all constructed, arranged, and operated as set forth.

145,635.—Thill-Coupling.—GEORGE M. DUNLAP, Springfield, Ohio. Application filed August 23, 1873.

Claim.—The combination of the axle-clip A with projection A, plate B, forked hook C with beveled end *c y*, thill-iron D with flanged head E, adjustable block G, and screw *f*, all constructed substantially as and for the purposes set forth.

145,636.—Cultivator.—DAVID B. EBERLY, Pine Village, Ind. Application filed May 31, 1873.

The axle-tree, formed of slotted sections or links, can be expanded or contracted by means of the slots and clamping-bolts, or by removing entirely some of the links. An arched section in the middle serves to "straddle" tall corn by removing the middle link.

Claim.—1. The expansible axle-tree B, consisting of the slotted links *b*, substantially as specified.

2. The combination, with a drag-beam, D, of the shovel-plow and the adjustable weed-cutting knife-blade attached to the sides of said drag-beam, and extending rearwardly of the share, as shown, and for the purpose mentioned.

3. In a cultivator, the detachable middle slotted link *b*, in combination with the arch J, substantially as specified.

4. The fulcrum *p'*, with its connection-pin Z, in combination with the slotted extension-axle B, substantially as specified.

145,637.—Slide-Pendant for Hanging Lamps.—JOHN A. EVARTS, West Meriden, Conn., assignor to BRADLEY AND HUBBARD, same place. Application filed October 26, 1872.

Claim.—In a pendent burner, the two weights W W, united by a bar, R, the said bar formed with an opening in the center to allow it to pass down over the chimney, substantially as described.

145,638.—Elevated Way.—HENRY W. FARLEY, Oswego, Ill. Application filed November 18, 1873.

An endless traveling elevated way, in which a series of metal plates are secured between two wire-cables, said plates traveling upon friction-rollers, and at required intervals passing between frictional driving-wheels, by means of which the cable or carrier is propelled. The carrier supports numerous cars or boxes, which are intended to be filled with grain or other freight without stoppage as they pass bins, which are erected along the line of the way.

Claim.—1. The hereinbefore-described carrier, consisting of the cables A and A', placed upon opposite sides of the horizontal bearing-plates B and B, having interlocking or plane edges, and connected together and with said plates by means of wires or rods C and C, substantially as and for the purpose specified.

2. In combination with the carrier A, B, and C, the freight boxes or receptacles M, placed above and supported by the same, substantially as and for the purpose shown.

3. In combination with the carrier A, B, and C, and with the freight-boxes M and M, the standards L and L, attached to and extending upward from said carrier, and furnishing supports for said boxes, substantially as and for the purpose set forth.

4. In combination with the carrier A, B, and C, resting upon and supported by suitable rollers D, the friction driving-wheels H', moving in a horizontal plane and engaging with the ends of said bearing-plates, substantially as for the purpose shown.

5. The bearing and driving wheels D and H', respectively, for sustaining and moving the carrier, arranged as shown and combined by means of the belts K, substantially as and for the purpose set forth.

6. In combination with a continuous carrier having a constant movement in one direction and provided with elevated freight boxes or receptacles, a grain-bin provided with a chute or spout arranged to discharge grain in the direction in which said carrier is moved, substantially as and for the purpose shown and described.

145,639.—Saddle-Tree.—ORLANDO V. FLORA, Madison, Ind., assignor to himself, JNO. G. MOORE, and JNO. B. ROSS, same place. Application filed September 6, 1873.

Claim.—1. A saddle-tree, the body and cantle A of which are made of one piece of wood, steamed, bent, and set in proper shape, and provided with a wooden cleat, C, substantially as and for the purpose herein specified.

2. In combination with the belt body and cantle A, the bent-wood pommel-piece B secured thereto by letting partially into the same, so as to dispense with iron straps, substantially as herein specified.

145,640.—Harvester-Dropper.—JAMES S. FOWLER, Davenport, Iowa. Application filed October 11, 1873.

A clutch on the shaft that operates the endless belts, forming the main platform, is connected by rods and levers with the dropping-platform, so that when the latter is discharging a gavel the cutter will be disconnected and the movement of the endless belts be stopped.

Claim.—The hinged dropper F F', connected to clutch-pulley on the shaft e of belt-drums D D', by means of rods *h g c*, as and for the purposes described.

145,641.—Coupling for Tubular Lightning-Rods.—JOSEPH W. FESTOCH, Cincinnati, Ohio. Application filed November 6, 1873.

Claim.—A lightning-rod composed of tubular sheet-metal sections, having one end flared and slotted, as at I, and the other end reduced in diameter, as at C, with a sloping shoulder, D, and a tongue, H, formed by the slits F F' extending from the end of each section inwardly, the sections being joined by the insertion of the reduced end of one into the flared end of another, the tongue H passing through slot I, and being bent back for securing the two sections together.

145,642.—Watch-Chain.—PIERRE FRONTIER and AUGUSTUS BELLEMERE, San Francisco, Cal. Application filed August 23, 1873.

Claim.—As a new article of manufacture, a watch-chain consisting of the loops with their points or projections *a a*, and the quartz or other suitable blocks *d*, constructed, combined, and arranged substantially as described.

145,643.—Saw-Gummer.—LUTHER GIBBS, Fremont, Ohio, assignor to himself and HASKEL HUDSON, same place. Application filed July 2, 1873.

The yoke C is fastened to the upright standard B by a bolt passing through a curved slot, the nut being loosened to adjust the emery-wheel, which is fastened to a shaft near the end of a movable frame sleeved on a countershaft, D, journaled in the yoke.

Claim.—The combination of the upright standard B, bifurcated standard C with the curved slot *x*, countershaft D, movable frame E with emery-wheel G, and the counterpoise M M', all constructed substantially as set forth.

145,644.—Automatic Catch for Sliding Doors.—AZEL W. GIBBS, Norwich, Conn. Application filed December 12, 1873.

A pivoted vertical bar and a horizontal bar are connected together, and the horizontal one furnished with a retracting-spring and a broken catch, which latter is entirely within the lock-case when the door is open, and when shut takes into a mortise-catch. The sliding door in shutting strikes a projection at the upper end of the vibrating bar, and thus throws the catch. While the door is open there are no projections against which objects could catch in being carried through.

Claim.—1. The traversing catch-bar F, furnished with a suitable spring, and pivoted to the vibrating bar D, the latter furnished at some proper point with a projection against which the door shall strike in closing, all arranged as and for the purpose set forth.

2. The combination of vibrating bar D and catch-bar F with projecting arm *m*, provided with an opening, *n*, as shown.

3. In combination with the vibrating bar D, the catch-bar F, and the trigger H for operating the same, all as described.

4. In combination with the bars D F and a suitable spring, the trigger H and mortise catch-plate, all as and for the purposes described.

145,645.—Machine for Heeling Boots and Gaiters.—LEOPOLD GRAF, Newark, N. J. Application filed November 13, 1873.

The tubular receiver serves to prevent the edge of the leg of a boot or gaiter from catching between the last and anvil.

Claim.—A tubular receiver arranged on the last of a heeling-machine, substantially as shown and described.

145,646.—Carriage-Wheel.—HENRY GWYNN, Baltimore, Md. Application filed September 3, 1873.

Claim.—1. The wooden sections *b*, forming the journal-box, in combination with the metal shell A, having the inner projections B, as shown and described, for the purpose specified.

2. The combination, with the metal shell A, having flange *a* with inner projections *a'*, and the flange *d* with polygonal perimeter, of the movable ring E, fitted on flange *d*, and the adjusting screw-nut *e*, for the purpose of forming a socket for the spokes, securing them in position, and permitting their removal, as specified.

3. In combination with the spokes and flanges *a* and B of shell A, the wedges *g*, arranged as shown and described, for the purpose specified.

145,647.—Machine for Cutting Leather for Boot and Shoe Heels.—MERRITT H. HALL, Philadelphia, Pa. Application filed October 6, 1873.

The reciprocating as well as rotary movement is effected by the combined action of the toggle-lever, crank-shaft, and stationary pawl.

Claim.—1. The combination of the reciprocating block E and toggle-levers B and B', operated by the cranks D' and B', as set forth and described.

2. The reciprocating block E, operated as described, in combination with the stationary pawl E', as set forth.

145,648.—Hinged Mast for Vessels.—JOS E. HAMMOND, New Bedford, Mass. Application filed December 4, 1873.

Claim.—A boat's mast divided just above the deck into two parts, when arranged with hinged ferrules C' C', and pins and chain-braces *f' f' f'*, all combined and operating substantially as and for the purpose set forth.

145,649.—Railway Rail-Joint Stiffener.—HORACE HARDING, Tuscaloosa, Ala. Application filed July 21, 1873.

The cross-tie under the rail-joint is supported by a wooden bar bolted thereto, and sustained upon the upper surface of two adjacent ties.

Claim.—The combination, with two rails jointed on a cross-tie, B, of the simple parallel wooden bar E, independent of and at some distance from the rails, and rigidly fastened to the tie B, but resting loosely on the ties adjacent and on each side thereof, as and for the purpose described.

145,650.—Dry Gas-Meter.—ANDREW HARRIS, Philadelphia, Pa., assignor to himself and JOHN J. GRIFFIN, same place. Application filed November 26, 1873.

An opening is formed in each bearing directly opposite the end of the spindle, through which is discharged the gummy matter which would otherwise prevent the necessary delicate operation of the parts.

Claim.—The combination of a bearing having a lateral opening, *a*, with the vertical spindle of a dry gas-meter, for the purpose specified.

145,651.—Adjustable Reclining-Chair.—JOHN J. HARTMAN, St. Louis, Mo. Application filed September 13, 1873.

The arms are provided with studs which engage with locks in the side rails. Said arms are pivoted to the back, which is thereby rendered adjustable, and the back is connected by rods with the pivoted foot-rest, and adjusts that also.

Claim.—The adjustable back D, the arms E, pivoted to the back at *c*, and provided with studs *f*, which engage in locks in the rails C, in combination with the foot-rest P and connecting-rod L, as set forth.

145,652.—Car-Coupling.—J. WILSON HESS, Montandon, Pa., assignor to himself and JOHN B. GREEN, same place. Application filed November 5, 1873.

When the bar D is depressed the pin C is free to swing outwardly and release the link.

Claim.—1. The combination, with the draw-head A and swinging coupling-arm C, of the rocking bar D, lever G, spring *a*, railing *b*, and notched plate *d*, all substantially as and for the purposes set forth.

2. The draw-head A, bar D cut out in the center, and the swinging arm C, all constructed and combined for operation, as and for the purpose set forth.

145,653.—Coffee-Urn.—CORNELIA HITCHCOCK, Milldale, Conn., assignor to herself and WILLIAM J. CLARK, same place. Application filed October 17, 1873.

Claim.—1. In combination with a vessel, A, provided with a faucet, E, the case F, with its cover H, the said case F having a vertical opening to permit the passage of the faucet, so that the vessel may be removed from or set into the said case, and means for closing said opening, substantially as described.

2. In combination with an urn having a faucet, *e*, leading therefrom, the drip-cup L, hung to the urn so as to be turned to and from the faucet, substantially as set forth.

145,654.—Boiler for Warming Buildings.—CHARLES F. HITCHCOCK, New York, N. Y. Application filed November 1, 1873.

The water-foot F, being placed at the point where the heat is greatest, insures the rapid heating of the water.

Claim.—1. A boiler for heating purposes composed of the shell A, inner case D, and ash-pan B, forming between them the water-space *f*, and of the fuel-reservoir E and grate C, all arranged in relation to each other substantially in the manner herein shown and described.

2. The combination of the shells A D and ash-pan B, which form between them the water-space *f*, with the pipe or conduit *s* and annular water-foot *f*, all arranged substantially as specified.

145,655.—Manufacture of Illuminating-Gas.—EDWARD R. HOPKINS, Newark, N. J., assignor of three-fourths his right to NATHAN P. TREADWELL, New York, N. Y. Application filed November 11, 1873.

Claim.—1. Three or more retorts, R, arranged one above another, and connecting by means of vertical connecting pipes or tubes, the highest of the series alone being provided with a standpipe, as and for the purposes set forth.

2. The process, as herein described, of charging a set of connecting retorts with unequal charges of coal, so that the gas shall pass from a lighter-charged retort into a heavier-charged retort placed above it.

145,656.—Ice-Creeper.—CHARLES H. JOHNSON and WILLIAM AXFORD, White Hall, Ill. Application filed July 12, 1873.

Claim.—The combination of the adjustable sole and heel ice-creeper D with arms B and G G, respectively, and the straps C C and J, substantially as and for the purposes herein set forth.

145,657.—Hoisting-Machine.—JENKINS JONES, Providence, R. I., assignor of one-half his right to JASON F. HOLMES, same place. Application filed November 11, 1873.

Claim.—1. A windlass-drum loosely mounted on a shaft, which is provided with a ratchet-wheel and a pawl for preventing its movement in one direction, in combination with a toothed clutch loosely mounted on the shaft, a shipper for controlling it, and the clutch-teeth respectively connected with the drum and the shaft, substantially as and for the purposes specified.

2. The combination of the shipper-brake H, the drum, the friction-plate and shaft, substantially as described.

3. The combination of the drum, shaft, and toothed plate with a clutch having teeth with inclined contact-faces, whereby the movable portion of the clutch will be pressed toward the teeth on the plate and kept in operative contact therewith, substantially as described.

145,658.—Metal Fastening Material for Leather-Work.—CHARLES KENISTON, Somerville, Mass. Application filed November 12, 1873.

The blank from which the staples are cut is a continuous length of wire, bent at regular intervals, and formed with semi-circular and alternately-reversed bends. The staples are made by cutting off or through the bend on one side or the other. The shanks are approximately abutting, and united by a head equal in length to the thickness of the two shanks.

Claim.—1. The staple-forming blank, formed substantially as described.

2. The staple having the abutting, or approximately-abutting, shanks, united by a head equal in length to the thickness of the two shanks, as shown at B.

145,659.—Apparatus for Cooling Air and Making Ice.—THOMAS D. KINGAN, Indianapolis, Ind. Application filed December 2, 1873.

The waste brine from the refrigerating-chambers containing ice and salt is used to freeze fresh water contained in vessels set into an intermediate chamber.

Claim.—1. The arrangement of the refrigerator A, the tube *d*, the pump D, the tube E, the refrigerator A', and the tube F, whereby the brine from the said refrigerator A is compelled to pass through the refrigerator A' before entering the box B, and whereby the temperature of the brine is greatly reduced before entering the box or trough B.

2. The combination and arrangement of the refrigerator A and the tube *d*, the pump D, the tube E, the refrigerator A', the tube F, the box or trough B, with its racks or frames F' and *s* and water-vessels C, constructed and arranged substantially as set forth, and the stop-cock G, all for the purpose, and in the way, substantially as set forth.

145,660.—Machine for Forming Pans.—EDWARD KUEBNER, Cincinnati, Ohio. Application filed October 13, 1873.

The forming-plates are attached to hinged levers made adjustable to different-sized forms, and operated by means of a foot-treadle and intermediate levers. Adjustable gages are also attached to the forming-plates, against which the edges of the blanks are placed for clamping. The clamping-plates are also adjustable.

Claim.—In a machine for forming sheet-metal pans, the bed-plate B, removable formers G, gages L, adjustable supporting-plates H, hinged leaves h K, fulcrums M, bent levers N *n*, adjustable compensating suspenders O, and lever Q, all combined and operating substantially as herein set forth.

145,661.—Shoulder-Pad.—LOUIS KYSER, Philadelphia, Pa. Application filed November 26, 1873.

A wire frame for giving shape to the shoulders of garments.

Claim.—As a new article of manufacture, the frame A, in combination with the transverse bands C, constructed and arranged substantially as and for the purpose set forth.

145,662.—Device for Detaching Horses.—ISRAEL L. LANDIS, Lancaster, Pa. Application filed July 14, 1873.

The traces can be pushed off the pins by the outward movement of the plates, which are to be operated by pulling the cords.

Claim.—The combination of the whiffletree A, having a ferrule, *b*, and pin *a* at each end, the plates B, with slots *c*, outward-projecting bars *d*, and arms *f*, formed of one piece and connected to the springs C, which are attached to the whiffletree, all constructed substantially as set forth.

145,663.—Box.—JOHN S. LASH, Philadelphia, Pa. Application filed May 26, 1873.

The body is formed of a continuous piece of wood, scored at the corners, except the one where the ends are locked by a dovetailed joint. The bottom is let into a groove in the sides, so that no nails, screws, glue, or other fastenings are used in constructing the box.

Claim.—The box constructed of the body A, formed of a continuous piece of material, scored at intervals, and having its ends locked by the double dovetail joint F, in connection with the "let-in" bottom E, so as to dispense with nails, screws, glue, or other fastenings for the body, as set forth.

145,664.—Sleeping-Car.—JAMES T. LEIGHTON and DOMINICUS R. LEIGHTON, New Haven, Conn. Application filed November 15, 1873.

Both the berths in each section are supported upon rails, which span the space between the seats. In the lower berth the outside rail is pivoted to the outer angle of the seat, and supported at the other end by a staple. The upper-berth supports are attached in a similar manner to the lower edges of the hinged backs, which are turned up into a vertical position. The rails are hinged at the center, and fold in spaces at the angle of the seat.

Claim.—1. The single hinged extensible rail I, in combination with the separate slat sections F G and the chairs, constructed for adjustment to form the lowest couch, substantially as described.

2. The single extensible rail I, hinged at one end, J, to one chair-frame, and supported and held at its free end by an angle-iron or staple, K, at the other chair-frame, and spanning the space between the chairs, substantially as described.

3. The section slat bottom G and the single hinged folding rail I, arranged to fold one beside the other, as and for the purpose described.

4. The combination, in a sleeping-car, of the hinged connecting-rails N N' with the hinged seat-backs B, to form a frame upon which to support the upper couch, as described.

5. The rail-support N N' for the upper couch, connected to and carried by the seat-backs B, whether in the extended or folded positions of these parts, as described.

6. The rail-supports N N', hinged to the corners of the lower edges of the hinged backs B, and folded parallel with and beneath the lower edges of said backs, turned down to the seat, as described.

7. The rail-supports N N', hinged at their opposite ends *i*, in combination with the end projections *f*, with which the rails lap and are braced, as described.

8. The bottom M, composed of slats A A A A, in combination with the ledges *g* of the hinged rails N N', as and for the purpose described.

145,665.—Corset.—LYMAN H. LOOMER, ANDREW F. LOOMER, and LOWELL M. SMITH, Birmingham, Conn., assignors to L. L. LOOMER & SONS, same place. Application filed September 24, 1873.

Each half of the corsets is of six pieces, joined without short gores.

Claim.—The herein-described corset, made from pieces having the configuration herein described, and shown in accompanying illustration.

145,666.—Fan.—CORBOYS C. LUSBY, Philadelphia, Pa., assignor of one-half his right to WILLIAM J. CHAMBERS, same place. Application filed October 28, 1873.

A fan in the handle of a parasol or cane.

Claim.—1. The combination, with a stick having a slide-recess elongated in the direction of its length, of a fan folding and expanding laterally into and from said recess, substantially as described and shown.

2. In combination with the handle or stick of a parasol, or other equivalent device, a folding fan opening laterally from the side of said handle or stick.

3. The stick or handle A, having the side recess *a* for the reception of the fan B.

4. In combination with the stick A, having the recessed side *a*, the fan B, fitting in said recess, as shown and described.

5. In combination with the recessed stick A and fan B, the slat or shield *b'* for concealing said recess, as described.

6. The elastic joint D, arranged as shown, for the purpose set forth.

7. The ring E, having the flange *e* cut away at *e'* for holding the fan closed, as specified.

145,667.—Lamp-Wick.—PEARL MARTIN, Medford, assignor to himself and EDWARD S. GILMAN, Somerville, Mass. Application filed September 10, 1873.

A glass tube is nearly filled with cotton, or other wicking, upon which is a stratum of clay, and above the clay a layer of asbestus.

Claim.—In a lamp or apparatus for generating and burning the vapor of a hydrocarbon fluid, the combination of the cotton, argillaceous, and asbestus mediums, arranged within a glass tube, *c*, in manner and for the purpose set forth.

145,668.—Seed-Separator.—FREDERICK W. MASH, Oshkosh, Wis. Application filed August 16, 1873.

A smooth cylinder is made to rotate by frictional contact with the outer surface of the hollow perforated screening-cylinder, for the purpose of keeping the perforations free from obstructions.

Claim.—The cylinder O, made to rotate by frictional contact with the hollow perforated cylinder I, constructed and operating as and for the purpose herein before set forth.

145,669.—Curtain-Fixture.—WILLIAM W. MASSEY, Baltimore, Md. Application filed November 12, 1873.

The cord-spool is tapered, and has on its inner end a flange and an annular groove, and is connected to the roller by a ferrule, and also by a screw, said screw forming the journal of the roller. A cord is attached to the spool, next to the flange, and bears at its other end a balancing weight.

Claim.—1. The tapered spool *a*, provided with the flange 1 and annular groove *a'*, in combination with the roller C, ferrule *c*,

and screw *b*, joining the spool and roller, and also forming the journal for the latter, substantially as described, and for the purpose set forth.

2. The combination of the tapered spool *e*, roller C, curtain A, cord *f*, and weight *g*, as and for the purpose set forth.

145,670.—Can for Paint, &c.—JOHN W. MASURY, Brooklyn, N. Y. Application filed November 13, 1873.

When the contents of the can are to be used the small soft-metal disk is cut, and the opening afterward closed by the valve.

Claim.—1. A soft-metal top or cover, B, capable of being cut with a knife, combined with the body of a can, A, by forming a flange, C, as described, on the can, and bending the edge of the cover over and under the flange, and securing it under the flange, substantially as described.

2. The valve-seat G, adapted to be secured to the side of a can or package, and provided with a removable disk or part, H, of soft metal, at or over the valve-opening in the seat, substantially as described.

3. The valve-seat G, adapted to be secured to the side of a can or package, in combination with the valve J, substantially as described.

145,671.—Rotary Engine.—WILLIAM P. MAXSON, Independence, Iowa. Application filed August 27, 1873.

The rollers are placed in slots in the periphery of the piston. Two plates are placed in recesses in each cylinder-head, and form annular recesses, in which the ends of the rollers turn.

Claim.—The wheel B, rollers C C, and wheels D and O, in combination with the case A, the several parts being constructed as and for the purpose set forth.

145,672.—Gas-Retort.—GEORGE A. MCILHENNY, Washington, D. C. Application filed October 10, 1873.

The door is hinged at one side, and provided at the opposite edge with a projecting lip, which engages with a cam having two inclines, one incline engaging over the lip to force the door down and hold it in place, the other to engage under the lip and force it out of contact with the mouth-piece.

Claim.—1. The neck-piece B, provided with the circular mouth H at its front end, and a flange for attaching it to the retort at its rear end, said part B being made D-shaped transversely, and having its floor or lower side flush with the floor of the retort, substantially as described.

2. The neck piece B, having its rear end of a form and size to fit the body E of the retort, and made to converge toward its front end, whereby a circular mouth and door of less diameter can be used, as set forth.

3. The locking-cam I, constructed and arranged to operate substantially as described, whereby it can be made to fasten and unfasten the door of a retort, as set forth.

145,673.—Automatic Attachment for Car-Couplings.—GEORGE H. MERRIAM, Portland, Me. Application filed January 9, 1873.

The box is rigidly secured in an ordinary draw-head. The pin-supporting block is thrust forward when the pin is raised by a spiral spring, which works on a rod attached to or forming part of the said supporting-block, and, when the link enters, the block is driven from beneath the pin, which falls through the link and effects the coupling.

Claim.—The combination of a box, A, cross-bar *a*, rod B, block C, having an overhang, C′, and spring *b*′, substantially as and for the purposes specified.

145,674.—Range.—LOUIS MEYER, St. Louis, Mo. Application filed November 1, 1873.

All the fire-places on each side of the two-flued chimney are connected by short flues with a common one in the rear of the range that connects with one of the chimney-flues. The canopy has an inner rim to prevent the escape into the room of fumes from the cooking utensils.

Claim.—1. A range consisting of the casing A, having one or more grates, B, wall C, flues *a* C¹ C², dampers *c*², and flue-plates *c*¹, as and for the purpose set forth.

2. The canopy D, having outer and inner rims *d* *d*′, as and for the purpose set forth.

3. The improved range, consisting of the casing A, wall C, canopy D, flues *a* C¹ C², flue-plates *c*¹, and dampers *c*², all constructed to operate as as and for the purpose set forth.

145,675.—Mason's Hod.—BARCLAY C. MONROE, Newburg, N. Y. Application filed October 6, 1873.

Claim.—As a new article of manufacture, a hod made from a single sheet of thin steel, and stamped into the required form, substantially as shown and described.

145,676.—Sad and Plating Iron.—LAWRENCE MOONEY, Allegheny, Pa., assignor to RAPHAEL MOONEY, same place. Application filed August 20, 1873.

The face of the iron is curved from the toe to the heel, and from side to side, and the rear end has a fluting-iron curved in the same form.

Claim.—1. A polishing-iron, A, the face of which is curved from its toe *a* to its heel *a*′, and in the opposite direction from its lateral face *c* to its face *c*′, said curves crossing at the center of the iron, substantially as described, and for the purpose specified.

2. A corrugated fluting-iron, B, the face of which is curved from its upper edge *b* to its lowest edge *b*′, and in the opposite direction from its lateral face *d* to its face *d*′, said curves crossing at the center of the iron, substantially as described, as and for the purpose specified.

3. A combined sad and polishing iron, having a double-reversed curved face, A, and double-reversed curved face B, the latter corrugated longitudinally, substantially as described, as and for the purpose specified.

145,677.—Ingot-Mold.—MATHEW T. MOONEY, Johnstown, Pa. Application filed August 19, 1873.

Claim.—A mold corrugated internally and externally in which to cast steel ingots, substantially as described.

145,678.—Railway-Switch.—THOMAS NEWMAN, New Orleans, La. Application filed September 18, 1873.

Certain cars which are to leave the main track are provided with a projection upon their forward and rear brake-shoe, said projection or lug acting against a projection on a slide, to which the movable-point rail is secured, thereby shifting the point to allow said car to leave the main track.

Claim.—The operation of railway-switches by means of the weight *d* to keep them open or closed, as may be desired, when the same are opened or closed in opposition to the said weight, by means of lugs or projections upon the brake-shoes of railway-cars, as described, and for the purposes set forth.

145,679.—Medical Inhaler.—JAMES CASPAR PARKINSON, Vineland, N. J. Application filed November 3, 1873.

A glass bulb has two contracted openings, and into one a tube is inserted by means of an elastic washer. This tube can be drawn out to different lengths required, and is used for insertion into the larynx for carrying the vapor of medicaments to be blown in by the mouth of the operator, placed at the opposite end of the large bulb, which is furnished with a sponge to hold the liquid used.

Claim.—The inhaler composed of the glass bulb A with its two openings, C and B, and the tube D, secured in the openings B by the elastic ring E, or its equivalent device.

145,680.—Refining Iron and Steel.—IRA M. PHELPS, Philadelphia, Pa. Application filed November 29, 1873.

Claim.—1. In an iron-refiner, a series of perforated tablets, C, the perforations through which gradually diminish in size, but increase in number from the highest to the lowest tablet of the series, in combination with an air-blast, substantially as described.

2. The combination, in a refiner, of an air-chamber, E, valves or dampers G, and a series of perforated tablets, substantially as described.

145,681.—Nail-Plate Feeder.—JOHN POULSON, Frenchtown, N. J., assignor of one-half his right to MUNSON BALDWIN, same place. Application filed November 22, 1873.

Two pins attached to the frame of the machine to work into opposite spiral grooves *d* in the periphery of the tube or nose-piece D, and turn it as it is reciprocated with the cross-head G. A spring, *k*, on a rod reciprocated with the cross-head G, to pass under one of the jaws that gripe the nipper-rod during each movement backward of the cross-head, lifts said jaw, causing it to press against and hold the nipper-rod, and thus feed it and the plate forward.

Claim.—1. The cylinder D, rotated by means described, and applied to a reciprocating cross-head, G, in combination with the jaws F, holding-spring *c*′, and head D′, as and for the purposes described.

2. The griping-jaws L L′, constructed as described, in combination with the spring-lifter *k* on a rod which is secured to the cross-head G, and with the centrally-perforated drum D and jaws F, substantially as described.

3. The cross-heads G G′, bed H, and guideways J J, pivoted to the brackets A¹ at *c*, in combination with the forked supports A², as and for the purposes set forth.

145,682.—Steam-Generator.—HENRY M. QUACKENBUSH, Herkimer, N. Y. Application filed November 1, 1873.

The annular steam and water chamber is provided with pendent pipes arranged around the fuel-reservoir and fire-place, through which a constant circulation is kept up. A metal guard is placed around the fire-place between the inner and outer arms of the pendent pipes, for the purpose of regulating the draft and increasing the circulation by confining the heat to said inner arms.

Claim.—1. The annular steam-and-water chamber A, combined with pendent pipes B B, which embrace the fire-place, and with the central fuel-reservoir D, which is embraced by the chamber A and pipes B B, substantially as herein shown and described.

2. The combination of the metal guard E with the pendent pipes *a* *b*, annular chamber A, and central grate C, all arranged as and for the purpose specified.

145,683.—Portfolio.—LOUIS F. RAYMOND, Bordeaux, France. Application filed October 24, 1873.

Claim.—A box or case within which are combined, as a part of the case, a roller or rollers with a sheet wound thereon through a slit in the case, and a folded sheet or sheets, the latter exposed by opening the cover, all substantially as shown and described.

145,684.—Tool-Holder for Lathes.—LEWIS REDER, Wilmington, Del. Application filed December 1, 1873.

A washer, D, fitted loosely around the tool-post, with its sides inclined in opposite directions, one higher or thicker than the other, and a shoe, E, upon which the tool rests, fitted through the slot in the post bearing upon the face of the washer, having the ends of its under side inclined, and one thicker than the other. With the thick end of the shoe on the thin side of the washer the tool will be level; but with the thin end on the thin side, the tool will be inclined.

Claim.—The combination, with the tool-holder A, of washer D and shoe E, the two having corresponding inclines *d* *d*′ and *e* *e*′, as and for the purpose described.

145,685.—Bridge.—ARNOLD REILING, Bellevue, Iowa. Application filed September 24, 1873.

The shoes and washer-plates are provided with grooves to drain the water from the joints, and thereby prevent rust and decay. The cap-pieces have downward projections for the same purpose.

Claim.—1. The metallic shoe D D′, constructed as described, with flanges *a* *b*, abutment *d*, and groove or gutter *e*, all substantially as and for the purposes herein set forth.

2. The washer *h*, provided with the groove *i* in its under side, for the purposes herein set forth.

3. The cap G, provided with projections *m* *m*, for the purposes herein set forth.

145,686.—Welding Copper.—EDWARD RENAUD, Washington, D. C. Application filed June 27, 1872.

Claim.—The process herein described for welding copper, consisting in bringing together the heated and cleaned surfaces to be united, covered with cryolite, or other similar anhydrous flux, and uniting by hammering, rolling, or pressing, substantially as set forth.

145,687.—Sewing-Machine.—ELTON F. RICHARDSON, Reading, Mass., assignor to GEORGE A. RICHARDSON, same place. Application filed August 16, 1873.

Improvement on Patent No. 128,173, and adapted to sew turned shoes. The vertically-moving guide serves as a guide for the edge of the sole and the guide-roll for the edge of the upper.

Claim.—1. In combination with the rotative thread-guide tube, the vertically-moving guide *r* at the foot of a tube or bar, *q*, working between the tube *s* and the needle-bar, substantially as shown and described.

2. In combination with the edge-guide *r*, the edge-guide or roll *w*, attached to the spring *v* beneath the work-plate, and extending up through said plate, substantially as described.

3. In combination with the edge-guide or roll *w*, the slide *z*, for depressing the guide *w*, substantially as described.

145,688.—Shutter-Worker.—THOMAS ROWE AND CHARLES T. ROWE, New York, N. Y. Application filed November 13, 1873.

A shutter-worker is constructed with a two-part case, the lower part of which is cast with lugs to hold it more firmly on the window-sill, and has likewise a journal-seat formed upon the inside wall, into which the end of a collared worm-shaft is loosely journaled.

Claim.—The combination of the collared worm-shaft C, for operating the pinion of a shutter-worker, with the two-part case A B, of which the lower portion A is cast with lugs or auxiliary feet *d*, and a journal-seat, *f*, formed upon the inside wall for loosely supporting the journal of the worm-shaft, while the upper part B has a depending flange for fitting within the case and resting upon the journals to retain them in position, all substantially as described and shown, for the purpose set forth.

145,689.—Furnace.—CHARLES SCHACHER and LOUIS FERET, Paris, France. Application filed October 24, 1873.

In place of fire-bars two hollow truncated cones are placed one above the other, an interval for the passage of air being left between them, a third cone acting as a cap. The air for the support of combustion is conducted from the fan or other device for creating draft through a pipe into the interior of said cones and through the perforations. The fine fuel is fed through a conduit directly upon the cones, a portion of it being carried by the force of the blast over a bridge into a combustion-chamber, where the premature exit of the fuel and combustible gases is prevented by a second hanging bridge.

Claim.—The combination of the furnace A, air-supply pipe B, hollow truncated cones C D, cone E, and feed-conductor G, the said pipe B opening below the said cones, and the conductor G opening above and upon the cone E, all substantially as specified.

145,690.—Cultivator.—GEORGE SLUSSER, Hillsborough, Ohio, assignor of one-half his right to C. S. BELL and JAMES H. ANDERSON, same place. Application filed August 20, 1873.

The beams of a parallel cultivator are only connected by an arched yoke, the horizontal ends of which are loosely pivoted in slots at the front end of beams. The whole is rendered steady by fixed bows or runners.

Claim.—The combination, in a double-shovel walking cultivator, of the beams B B, slotted at their front ends, the adjustable arched yoke D, adjusting-pins E, and curved fixed runners F, constructed, arranged, and operating as described.

145,691.—Cultivator.—ARTHUR C. SMITH, Fayetteville, N. C. Application filed September 15, 1873.

Diagonal braces, having swiveled screw-joints, connect each beam with the others, and also with the upper part of the handles.

Claim.—1. In an implement consisting of two or more plows, the combination of the diagonal braces D D, connecting the front parts of the beams with the upper parts of opposite handles, and the diagonal braces G G, connecting the upper and lower parts of opposite handles, substantially as herein set forth.

2. In an implement consisting of two or more plows, the combination of the diagonal braces D D, connecting the front parts of the beams with the upper parts of opposite handles, and the diagonal braces J J, connecting the front and rear ends of opposite plow-beams, substantially as herein set forth.

3. In an implement consisting of two or more plows, the combination of the diagonal braces D D, connecting the front parts of the beams with the upper parts of opposite handles, the diagonal braces G G, connecting the upper and lower parts of opposite handles, and the diagonal braces J J, connecting the front and rear ends of opposite beams, all substantially as herein set forth.

145,692.—Child's Carriage.—LEONARD SNOW and JOHN HASELTINE, Boston, Mass. Application filed January 20, 1873.

Claim.—The springs K, K′, and H, and axle L, combined as described, and for the purpose set forth.

145,693.—Machine for Hulling Rice.—HENRY B. STEVENS, Buffalo, N. Y., assignor to GEORGE L. SQUIER, same place. Application filed July 2, 1873.

Hulling-surfaces composed of wood. Strips of rubber arranged in hulling-surfaces for changing the position of the kernels. Devices for facilitating the removal of runner-stone.

Claim.—1. A hulling-mill in which the hulling or rubbing surfaces are composed of wood, arranged so that the end of the grain thereby will form the rubbing or hulling surfaces, substantially as hereinbefore set forth.

2. A hulling-mill in which one or both of the rubbing-surfaces are composed of wood, with strips or blocks of rubber arranged therein to facilitate the rolling or changing of the position of the kernel, as and for the purposes set forth.

3. In a hulling-mill, the combination of the metallic frame *b*′, formed with a series of radial pockets for the reception of removable wooden or rubber blocks, substantially as shown and described.

4. A hulling-mill in which the rubbing-surfaces of the runner are dressed with radial grooves, both sides of which are equally inclined, for the purpose of permitting a reciprocating rotary motion being given to the runner, substantially as hereinbefore set forth.

5. The combination, with the stationary hulling-block H, of the runner B, having a reciprocating rotary motion, whereby a reversed and twisting movement is imparted to the grain, thus changing the presentment of the grain to the hulling-surfaces, substantially as described.

6. The bottom L′ of the case, provided with opening *l* and removable discharge-spout *o*, to permit of the removal of the runner without detaching the bevel-wheel, substantially as hereinbefore set forth.

145,694.—Combined Punching and Shearing Machine.—CHARLY SWANSON, Newton, Iowa. Application filed November 4, 1873.

Claim.—The base A A, frame B B C C, the lever D having pendent branch E with flange *a*, and carrying a punch and a shear-blade, the lever F, link-coupling G, stay-plate *d*, die *f*, and holder H, when combined to form a punch and shears, substantially as described.

145,695.—Barrel-Tap and Faucet.—GEORGE B. TAYLOR, Oakland, Cal. Application filed April 12, 1873.

The passage leading to the faucet is controlled by a supplemental valve, which permits the insertion of the faucet into the tap without the escape of liquid or gas.

Claim.—1. In combination with a permanent barrel-tap and faucet, C, the valve *i* and screw *k* for operating said valve, by which the liquid is admitted to the faucet C, when said screw is entirely independent of the faucet, substantially as set forth.

2. The plug A, with its limited bore *b*, hole *d*, screw-rod A, valve *i*, and angular passage *e*, in combination with the faucet C, substantially as and for the purpose described.

145,696.—Machine for Cutting Nails.—MAGLOIRE THIBAULT, Hull, Canada. Application filed November 17, 1873.

A series of dies, arranged horizontally in a circle, for cutting nails from plates fed vertically from above, operated by a single eccentric revolving in the center, within a grooved ring, which groove receives the lugs upon the radiating arms on the inner movable dies. The feeding devices (one over each die) are raised and turned a quarter-turn after each cut, by means of collars and star-wheels on their shafts, operated upon by a cam and pin on a wheel below the dies and revolving with the central shaft.

Claim.—1. The combination, in a machine for cutting or punching nails and other articles from sheet metal, of a series of stationary die-holders, H, with a corresponding series of reciprocating die-holders, J, arranged radially from a common center, substantially as described, whereby the entire series may be operated by a single eccentric, *n*, as set forth.

2. The combination of the rotating eccentric *n*, laterally-moving ring *o*, and the slides or arms *s* provided with the lugs or projections *x*, all constructed and arranged to operate substantially as described.

3. The plate holder or feeder F, provided with apertures *f*, *r* the nail-plates, arranged at right angles, and the pivoted plates *f*, or their equivalents, in combination with the case G for feeding the plates to the dies, substantially as described.

4. The wheel B, provided with the cam *t* and arm I, in combination with the shaft P, provided with the collar *s* and star-wheel *f* for operating the feeders or plate-holders, as set forth.

5. The combination of the rotating plate holder or feeder F, the plate R provided with the slot Y, the stop *w*, and a pair of die-holders, all constructed and arranged to operate as set forth.

145,697.—Mechanism for Operating Screw-Propellers.—FRANCIS H. TOMAS, New York, N. Y. Application filed October 22, 1873.

Claim.—The combination of the propelling mechanism, consisting of propeller, shaft, and pinions, and the operating parts I J *e* K, the reversing and steering mechanism, the combination and arrangement being adapted for operation as herein shown and described, whereby a boat may be propelled, steered, and reversed by a single person, or steered and reversed by a single person, when propelled by other power, as and for the purpose specified.

145,698.—Hand Corn-Planter.—JOHN D. TRACY and JAMES F. PLATT, Sterling, Ill. Application filed July 19, 1873.

The bottom of the seed-box is made converging, and provided with a brush pressing against the seed-slide, which has an adjustable seed-cell, and slides vertically. The seed falls upon a scattering-board, and is caught upon the spring-valve, which forms one side of the opener. After the machine is thrust into the ground the plunger forces the seed into the soil.

Claim.—1. The scatterer D′, arranged as described, in combination with the pivoted dropper E D and a plunger, G, having a seed-cell in it, as set forth.

2. The double-inclined channel *b b b* at the bottom of the seed-box A, combined with the brush *c* and the seed-cell *e*, formed as described.

145,699.—Tobacco-Stripping Machine.—JOHN R. TUNNICLIFF, Van Hornesville, and JUDSON L. THOMSON, Syracuse, N. Y. Application filed January 2, 1873.

The tobacco-leaf is fed between two rollers having cutting-disks to remove the stems; then passes along, carried by two pairs of endless belts between four other pairs of rollers, when revolving brushes or scrapers loosen the leaf, and it passes on to a fan which automatically deposits the two portions of the stripped leaf in piles.

Claim.—1. In combination with the stripping-rollers A and B, the double belts *a a* and *b b*, and the cylinders C C and E E, arranged and operating substantially as described.

2. In combination with the continuous belts *a a* and *b b* and the fan V, the cylindrical brushes H H′, or the equivalent scrapers, placed and operating substantially as set forth.

3. In combination with the stripping and pressing devices, substantially as described, a booking-fan, V, as and for the purposes set forth.

4. The combination of double aprons *a a b b*, pressing-cylinders C C and E E, brushes or scrapers H H′, booking-fan V, and table T, all constructed, arranged, and operating substantially as described, and for the purposes set forth.

145,700.—Fire-Proof Building.—ERNEST VACHER, New York, N. Y. Application filed August 28, 1873.

Flues made of card-board or other similar material are placed in position where the partition-wall or ceiling is to be, and a two-part mold is placed around them. Cement, or any of the compositions of which artificial stone is made, is then filled in, and left to set, after which the mold is removed, and a hollow wall is obtained. The wall may also be cast in sections.

Claim.—A partition-wall or ceiling cast in one or more pieces around a series of ventilating-flues, set into their proper places before the material composing the partition-wall or ceiling is applied, substantially as set forth.

145,701.—Screw-Plate.—THEODORE L. VON DORN, Omaha, Neb., assignor to himself and ALBERT J. POTTER, same place. Application filed November 22, 1873.

Plate C is rotated within the ring B, and has an oblong slot, which, by turning the plate to one position, will coincide with the dies underneath it and admit of their removal, or if turned to another position will not coincide, and will thus prevent the dies from falling out.

Claim.—1. The combination of screw-plate A, ring B, and rotating plate C, substantially as and for the purpose described.

2. The rotating plate C, provided with spring-handle D, in combination with ring B, with stop *i*, all arranged in connection with a screw-plate, substantially as and for the purpose set forth.

145,702.—Process of Making Lamp-Shade Supports.—WILLIAM M. WHEDEN, Waterbury, Conn., assignor to THE BENEDICT & BURNHAM MANUFACTURING COMPANY, same place. Application filed November 11, 1873.

The plate is inserted between the dies R S T, when the annular die S is brought down, cutting out the blank, and molding the outer ring, and holding it firmly until the interior die R is brought down to corrugate, and thereby stretch the radial arms. The blank is then placed between a second pair of dies, which shape it up by cutting out and molding the inner ring, and distending, carving, and longitudinally corrugating the arms.

Claim.—The process herein described for the manufacture of shade-rings.

145,703.—Combined Secretary, Wardrobe, and Bedstead.—ALONZO WEEKS, Washington, D. C. Application filed October 3, 1873.

The lower portion of an upright wardrobe is adapted to extend forward into a bedstead, the sides of which unfold on vertical edges. There are receptacles for clothing, as also compactly-arranged necessaries for an invalid.

Claim.—1. The combined secretary, wardrobe, book-case, and writing-desk, provided with the chambers G H, chair I, and the detachable folding bedstead, substantially as and for the purpose described.

2. In combination with a secretary having a folding bedstead constructed as described, the auxiliary jointed sections, substantially as and for the purpose specified.

3. The folding bedstead, provided with a head-board having a hinged top section, which is adapted to be elevated into a vertical position to form a prolongation of the base of the head-board, and of being turned down against the side of the same when not in use, and of being retained in a horizontal position to serve as a work-table, as herein shown and described.

4. The combined seats and handles, pivoted to the head-board of the bedstead, or lower panel of the secretary, as and for the purpose set forth.

145,704.—Still for Alcoholic Spirits.—CARL ERNST WERNER, Brookfield, Mo. Application filed October 17, 1873.

Claim.—The combination and arrangement of the still A, condenser B, vapor-pipe *r* leading from top of still to bottom of condenser, pump *k*, descending coil *d*′, and conducting-pipes *d d*², all as herein described, for the purpose set forth.

2. The combination of the pump *n* and pipe *n*′ with the condenser B and still A, for taking low wines from one to the other, as explained.

145,705.—Cement for Slate Roofing.—HORACE WHEELER, Burlington, Vt. Application filed September 8, 1873.

Roofing-slates are attached, without overlapping, by a cement compound of ground clay, ground plaster-of-paris, ground slate, coal-tar, and linseed-oil placed between the foundation and the slates. The joints between the edges of the slates are also filled with the same composition.

Claim.—The roofing-cement composed of ground clay, ground plaster-paris, ground slate, coal-tar, and linseed-oil, and used with a paper or other foundation, and blocks or slabs of slate, substantially as herein set forth.

145,706.—Game Apparatus.—JOHN C. WILHELM, Shaver's Creek, Pa. Application filed November 8, 1873.

A game played with pieces upon a board of a hundred squares, in the nature of chess, but having the pieces (instead of the monarchic titles of chess) named after the officers, arms, and war material of a republic.

Claim.—The game apparatus herein described, consisting of the board and pieces, substantially as and for the purpose specified.

145,707.—Distilling Petroleum.—ASA W. WILKINSON, New York, N. Y. Application filed July 23, 1873.

Claim.—The within-described process of distilling petroleum, by injecting into and through the liquid mass contained in the still a gas or vapor which will not produce combustion, and will not enter into a deleterious combination with the product of distillation, substantially as set forth.

145,708.—Harness-Trace.—ROBERTS WILLIAMS, Philadelphia, Pa. Application filed December 8, 1873.

Claim.—1. The combination of the leather trace A, metal plate B, and the staples C C, said staples passing over the plate and their pointed ends *a a* forced through the leather and clinched on the opposite side, all substantially as herein set forth.

2. The combination of the leather trace A, metal plate B, staples C C, and strap D, all constructed substantially as and for the purposes herein set forth.

145,709.—Device for Suspending and Exhibiting Placards, &c.—EDWIN WORRELL and BARTON C. MOORE, Philadelphia, Pa. Application filed June 21, 1873.

A rod hooked at bottom and curved at top to form a jaw. Another jaw is pivoted to it, and kept closed by a descending arm held open by a spring. Round this a loop of a rod is passed, which, when drawn down, contracts the spring and opens the jaw. There is a projection on the end of each jaw to form a clasp for attachment to moldings, &c.

Claim.—1. In a suspension-hook, the combination, with the jaw B, extension A, jaw C, extension D, and spring E, of the sliding rod F, having a stirrup, G, moving on the extension D, for opening the jaws B C, substantially as and for the purpose described.

2. The jaws H, projecting from the jaws B C, and spring E, in combination with said jaws B C, extensions A D, rod F, and stirrup G, substantially as and for the purpose set forth.

145,710.—Wrench.—SYLVESTER J. WRIGHT, Ellsworth, N. Y. Application filed October 15, 1873.

A brace is provided with a transversely-slotted bar, through which the curved arms that embrace the nut are arranged to slide, and thereby made adjustable.

Claim.—The brace A, having firmly attached thereto the flanged and slotted plate B, and plate D, adapted to slide freely thereon, in combination with curved jaw C hinged to plate D, and sliding in the slotted plate B, substantially as herein described.

145,711.—Guide for Cutting Photographic Pictures.—LEWIS T. YOUNG, Philadelphia, Pa. Application filed October 16, 1873.

Recesses are formed at the corners to allow the cutter employed to pass the right-angle line, and thus leave the corners of the picture, mat, &c., square.

Claim.—A cutter form or guide for cutting photographic pictures, mats, &c., having its angular corners recessed, slotted, or notched, as shown at *b b*, substantially as and for the purpose described.

145,712.—Head-Block for Saw-Mills.—GUSTAVUS ZSCHECH, Indianapolis, Ind. Application filed November 8, 1873.

The setting-shaft is operated through a system of bevel-gears moved by a hand-lever, to which is attached two segmental gears.

Claim.—1. The wheels *d d g g*, applied on the shaft D by means of double-headed keys *j j*, the wheels *d d* being acted on by springs *s s*, and the wheels *g g* engaging with segments F F on lever F′, in combination with saw-mill head-blocks, substantially as described.

2. The pins G G and their finger-keys G′ G′, in combination with the wheels *d d g g* and the springs *s s*, substantially as and for the purposes described.

3. The combination and arrangement of the wheels *a b*, yoked levers *c*, wheels *d d g g*, and segments F F on lever F′, and crank J on shaft D, as described.

REISSUE PATENTS.

5,683.—Cradle.—FRANKLIN CHICHESTER, Milwaukee, Wis., assignor to himself and LEMUEL A. CHICHESTER, Phœnicia, N. Y.—Patent No. 141,033, dated July 22, 1873. Application filed October 27, 1873.

The body of the cradle rests on a vertical pivot affixed at each end to the upper part of the stand. By means of a lateral band-spring at each pivot, the cradle oscillates on receiving an impulse.

Claim.—A child's cradle with pivots and springs placed between the cross rails and base-pieces, to support and allow the cradle to swing thereon, substantially as shown and described.

5,684.—Illuminating Vault-Cover.—WILLIAM DALE, New York, N. Y., assignor of two-thirds interest to WILLIAM S. O'BRIEN.—Patent No. 112,428, dated March 7, 1871. Application filed November 12, 1873.

A perforated vault-cover containing illuminating-lenses, which are secured in position by a filling material flush with the upper edge of the plate and the top of the lenses. Small ventilating-openings are made in the outer edge of the plate.

Claim.—1. A cover for openings in pavements, constructed of a metallic dish, A, having holes in the bottom plate A^2, and bull's-eyes B, which are surrounded by a material which, with the bull's eyes, forms the entire upper surface within the rim A^1, substantially as described.

2. A cover for openings in pavements, constructed of a metallic dish, A, having holes in the bottom plate A^2, and bull's-eyes B, which are surrounded by a material which, with the bull's-eyes, forms the entire upper surface within the rim A^1, and also having openings for ventilation through the vertical portion of the metallic dish, substantially as described.

5,685.—Spring.—FRITZ K. JOHN, Moscow, Russia.—Patent No. 134,673, dated January 7, 1873. Application filed November 24, 1873.

Claim.—A spring composed of two or more annular disk-shaped plates, with radially-arranged corrugations *b b* between outside and inside flanges *c d*, and bent to assume a conical shape, and alternately connected around their inner and outer peripheries, substantially as shown and described.

5,686.—Magic Lantern.—LORENZO J. MARCY, Philadelphia, Pa.—Patent No. 77,300, dated April 28, 1868. Application filed May 31, 1873.

Claim.—1. A magic-lantern box constructed, substantially as hereinbefore described, with a flame-chamber of metal surrounded, or partially surrounded, by an outer casing of non-conducting material.

2. A magic-lantern box constructed, substantially as described, with a cylindrical shell, of a diameter only slightly exceeding that of the reflector and lenses which close its ends, for the purposes specified.

3. The combination, substantially as described, in a magic lantern, of the base, the supporting-standards, the lantern-box supported above the base, and the removable caps containing the reflector and slide, and closing the ends of the box.

4. The combination, substantially as set forth, in a magic lantern, of a tubular body, having a reflector at one end and lenses at the other, with a lamp-chamber and chimney interposed between the reflector and lenses, for the purposes specified.

5. The combination of the tubular double-walled lamp-body, the reflector-cap, and the glass interposed between the reflector and lamp, these members being constructed and operating in combination substantially as set forth.

6. The connection of the objective tube with the base by detachable fastenings, substantially in the manner described, to admit of its easy removal and replacement.

7. The combination, substantially as set forth, of a lantern-box, a base, and an objective tube, whereby the base alone forms the connection between the tube and box, and an unobstructed space is left between them for the slides.

8. The combination of the lamp-body, the detached tube-plate, and the slide-frame moving in guides in said plate, these members being constructed and operating in combination substantially as set forth.

9. The combination, substantially as set forth, in a magic lantern, of a supporting-base, an elevated lantern-body overhanging its supports, and a slide-frame mounted on said base independently of the lantern-body.

10. The combination, substantially as set forth, of the base, the lantern-body, the objective tube, the slide-frame, and the stop which limits the movement of the slide-frame.

11. The combination, substantially as set forth, of the slide-frame and its shifting-lever.

12. The combination, substantially as before set forth, of the base, the elevated lantern-body, the slide-frame, the shifting-lever, and the stop, for the purposes described.

5,687.—Spark-Arrester for Locomotive-Engines.—WILLIAM MCKELVY THORNTON and THOMAS ALFRED BUCKLAND, St. Louis, Mo.—Patent No. 132,877, dated November 5, 1872. Application filed December 1, 1873.

The smoke and sparks, after they leave the smoke-stack, are conducted through a closed cap on top of said stack, in which are arranged deflecting-plates and draft-regulating valve, and deflected by a curved plate downward and backward into a reservoir covered with wire netting, the shield and deflectors therein directing them downward and preventing the rapid destruction of the cone and reservoir.

Claim.—1. The imperforated cap B, having curved deflectors *g g* applied within it, in combination with the stack A and reservoir E, the latter having a perforated top, all arranged substantially in the manner described.

2. The combination of the deflector *c*, curved deflectors *g g*, and the imperforated cap B, substantially in the manner and for the purpose described.

3. The combination of the deflector *c*, imperforated cap B, stack A, and reservoir E, the latter having a perforated top, and all arranged, constructed, and operating substantially as and for the purpose shown and specified.

4. The adjustable valve *b*, in combination with the cap B, smoke-stack A, and reservoir E, substantially as described.

5. The combination of the deflecting and receiving reservoir E, having a perforated top, the conical connecting-chamber C, formed and located as described, imperforated deflecting cap B, and smoke-stack A, substantially as described.

6. The combination of the imperforated cap B, smoke-stack A, and reservoir E, the latter having a perforated top, all constructed, arranged, and operating as and for the purpose shown and specified.

7. The shield A, arranged in the reservoir, in combination with the close cap B, substantially as described.

8. The deflector *c*, combined with the shield A, and arranged substantially as described.

9. The deflector *f*, arranged as described, in combination with the close cap B and shield A, substantially as described.

5,688.—Constructing Wire Fence.—JOSHUA W. RAFFLETY, Farmer Village, N. Y.—Patent No. 116,755, dated July 4, 1871. Application filed May 22, 1872.

A sled laden with rocks serves as an anchor in advance of the work, that the belaying operation may be rendered facile. As the work proceeds the sled is removed with its load or emptied, to be refilled at the next place of anchorage.

Claim.—1. The combination of a movable weight, D, the windlass E, and double-tree or evener G, or its equivalent, to operate upon the wires *c c c′ c′*, for maintaining equal tension and adjustment to the taking up of the wires while weaving in the pickets or palings *b*, substantially in the manner herein shown and described.

2. The combination of a movable weight, D, and double tree or evener G with the hand-levers H, to operate upon the wires *c c c′ c′*, for maintaining tension upon the wires, and twisting or crossing the same while weaving in the pickets, substantially as described.

3. The double-tree or evener G, in combination with the windlass E for maintaining uniform tension on the wires *c c c′ c′* while weaving in the pickets or palings, substantially as described.

4. The sheath or holder *i*, in combination with the open-headed spike or hook J, to receive, support, and protect the wires *c c c′ c′*, substantially as described.

5,689.—Gage for Sewing-Machines.—CHARLES C. ROBERTS, Perrysburg, Ohio.—Patent No. 124,086, dated February 27, 1872. Application filed June 25, 1873.

This device is adapted to guide the overlapped ends of pieces of wood or other suitable material to be united by stitches in the formation of boxes for fruit, &c.

Claim.—1. The gage herein described, consisting of the shouldered finger B and the finger C, adapted to be secured to an arm, A, as and for the purpose set forth.

2. In sewing-machine gages for sewing boxes, two fingers, B C, or plates so arranged in relation to each other that the material whereof the boxes are made is lapped and gaged between said fingers for sewing, substantially as and for the purpose set forth.

5,690.—Extension Foot-Rest for Chairs.—JOSEPH H. TRAVIS, Charlestown, Mass.—Patent No. 132,503, dated October 22, 1872. Application filed July 22, 1873.

The rest-frame is suspended beneath the chair-frame by pendent levers or rods, so that it can be inclosed within the legs of the chair or drawn out therefrom in front of the chair, and the foot-rest is pivoted between the side rails of the rest-frame, so that it can be folded back between said rails or advanced thereon as an extension of the device.

Claim.—1. The rest-frame D, suspended beneath the chair by the levers I I for the movement described, in combination with the foot-rest E, pivoted between the side rails of the rest-frame, and adapted to lay within the same, and when unfolded to be retained in a firm position, substantially as described, and for the purpose set forth.

2. The frame D, composed of the side rails F F, rounds G G', and reversible foot-rest E, in combination with the suspended levers I I and cross-rod a, substantially as shown and described, for the purpose specified.

5,691.—Revolving Fire-Arm.—ROLLIN WHITE, Lowell, Mass.—Patent No. 143,394, dated September 30, 1873. Application filed November 10, 1873.

Claim.—1. In a revolving fire-arm, the combination of a piston, having and operated by a pawl, and a cartridge-extractor disconnected from the mechanism for operating it, substantially as and for the purposes set forth.

2. In a revolving fire-arm, the combination of a piston having a pawl connected therewith, a cartridge-extractor, and a cam stationary on the lock-frame, substantially as and for the purposes set forth.

3. In a revolving fire-arm, the combination of a piston having a pawl, a cartridge-extractor disconnected from the mechanism for operating it, and a cam or stop stationary on the lock-frame, substantially as and for the purposes set forth.

4. In a revolving fire-arm having a removable extractor, an operating-piston made separate and independent from the extractor, and operating in a line therewith, substantially as and for the purposes set forth.

5. The adjustable stop S for automatically releasing or unshipping the pawl 1 at any desired or predetermined point in the act of tilting the barrel, as described.

6. The cam *l*, in combination with the pawl 1, stop S, and piston for operating the cartridge-extractor, substantially as specified.

7. The combination, with a hinged barrel of a fire-arm, of the pivoted spring locking-bolt *i*, having a projection, *k*, the slotted spring locking-plate A, and the projections *j* on the breech, all substantially as and for the purposes set forth.

8. The lever-cam *i*, in combination with the spring-catch which locks the cylinder, substantially as herein set forth.

9. The combination, in a revolving fire-arm, of the hammer a and spring-bolt *b*, having the double bearing shown, whereby a rebounding lock or hammer is obtained, as set forth.

INDEX OF INVENTIONS PATENTED DEC. 16, 1873.

	Class No.	Whole No.
Alarm, till, W. Mallek	24	145,514
Amalgamating gold and silver, J. Tunbridge	3	145,603
Axles, machine for rolling carriage, J. C. Richardson	60	145,526
Bale tie, cotton, D. S. Skinner	7	145,536
Barrel tap and faucet, G. B. Taylor	167	145,695
Batting, machine for making, F. W. Bloodgood	28	145,615
Bedstead, sofa, P. J. Larson	62	145,508
Beehive, L. J. Diehl	9	145,634
Billiard table, C. Schulenburg	143	145,533
Bit brace, W. E. Person	29	145,524
Blacking box holder, S. T. Wyman	16	145,544
Boiler, agricultural, H. A. Mears	148	145,517
Boiler for warming buildings, C. F. Hitchings	148	145,654
Boiler safety valve, steam, H. W. Shepard	148	145,534
Boiler, wash, Culver and Moseley	91	145,558
Boilers, plugs or ferrules for stopping leaks in the tubes of steam, E. A. Copeland	148	145,631
Boot, G. C. Parker	16	145,589
Boot and shoe heels, machine for breasting, W. C. Butler	16	145,625
Boot and shoe heels, machine for cutting leather for M. E. Hall	16	145,647
Boot and shoe tip, F. W. Rhinelander	16	145,590
Boots and gaiters, machine for heeling, L. Graf	16	145,645
Boots and shoes, machine for buffing, G. C. Hawkins	16	145,501
Bottle cover, W. Bourguignon	1	145,484
Box, J. S. Lash	63	145,663
Bridge, A. Edling	21	145,685
Bridge column, J. Zollweger	21	145,545
Brush holder, C. L. W. Baker	22	145,479
Brush woods, machine for shaping, J. Ames, Jr.	22	145,546
Building, fire-proof, E. Vacher	4	145,700
Butter worker, S. H. Bush	45	145,624
Button holder, M. J. Cooper	38	145,556
Can for paint, &c., J. W. Masury	107	145,670
Candlestick, W. H. B. Hinds	90	145,502
Car coupling, J. W. Hess	122	145,652
Car coupling, W. B. Mitchell	122	145,524
Car couplings, automatic attachment for, G. H. Merriam	122	145,673
Car elevating and transferring apparatus, railroad, W. T. Beekman	79	145,611
Car mat, J. O'Neill	122	145,588
Car, sleeping, J. T. and D. R. Leighton	121	145,664
Car starter, J. G. Thompson	122	145,600
Cars, brake beam for, D. Wellington	122	145,605
Carpet stretcher and tacker, Z. A. Ward	62	145,604
Carriage axles, manufacture of, Lones, Vernon, and Holden	31	145,510
Carriage, child's, Snow and Haseltine	31	145,692
Carriage wheel, H. Gwynn	31	145,646
Chain links, machine for bending, C. B. Long	60	145,511
Chair, adjustable reclining, J. J. Hartmen	62	145,651
Chair, adjustable reclining, G. A. Schastey	62	145,595
Chairs, extension foot rest for, J. H. Travis, (reissue)	62	5,690
Chimney top, J. C. H. Brown	166	145,621
Churn dasher, H. B. Robinson	45	145,592
Clamp, book, W. A. Miller	15	145,582
Clothes pins, machine for making, B. B. and A. J. Ockington	173	145,587
Coffee roaster, W. J. Lane	154	145,576
Copper, welding, E. Renaud	136	145,686
Corn, &c., preserving green, Merrill and Soule	58	145,581
Corn dropper, R. M. and W. H. Bowman	133	145,552
Corset, Loomer and Smith	38	145,645
Cotton worm destroyer, J. W. Johnson	63	145,571
Cotton worm destroyer, J. W. Johnson	63	145,572
Cradle, F. Chichester, (reissue)	62	5,683
Culinary vessel, W. A. Barlow	154	145,550
Cultivator, D. B. Eberly	43	145,636
Cultivator, J. E. Sieson	43	145,535
Cultivator, G. Slusser	43	145,690
Cultivator, A. C. Smith	43	145,691
Curtain fixture, W. W. Massey	62	145,669
Cutter, straw, T. D. Anderson	59	145,476
Doors, automatic catch for sliding, A. W. Gibbs	93	145,644
Doors, rail for sliding, J. Collins	30	145,630
Dovetail marking device, G. Ashby	173	145,477
Drills, &c., die for forming rock, D. Minthorn	29	145,519
Drop light, center, C. Deavs	64	145,632
Engine, locomotive, &c, steam, L. Perkins	94	145,525
Engine, rotary, C. C. Klein	150	145,505
Engine, rotary, W. P. Maxson	150	145,671
Fan, C. C. Lusby	165	145,666
Faucet, wash-stand, W. S. Bate	167	145,609
Fence, flood, G. W. Duncan	59	145,483
Fence post, H. S. Ross	52	145,528
Fences, constructing wire, J. W. Rappleye, (reissue)	52	5,688
Fiber disintegrator, Berthet and Laberie	78	145,613
File, bill and paper, W. H. Foye	146	145,497
Fire arm, breech loading, J. Duval	18	145,494
Fire arm, magazine, A. Asamus	55	145,478
Fire arm, revolving, R. White, (reissue)	123	5,691
Food or sauce, F. A. Friscia	35	145,562
Furnace, Schacher and Feret	149	145,689
Furnace door, D. Auld, Jr.	154	145,608
Furnace, hot air, G. W. Day	154	145,489
Furnace, hot air, J. Magee	154	145,512
Furnace, hot air, J. Magee	154	145,513
Gage, recording steam, J. B. Edson	94	145,495
Game apparatus, J. C. Wilhelm	143	145,706
Gas, manufacture of illuminating, E. R. Hopkins	66	145,655
Gas retort, G. A. McIlhenny	66	145,672
Gearing, J. J. Greenough	67	145,499
Generator, steam, H. M. Quackenbush	148	145,592
Generator, steam, J. Ryan	148	145,530
Generators, device for cleaning steam, D. L. Latourette	148	145,577
Grain basket H. C. Jones	63	145,573
Grinding machine, P. D. Cummings	57	145,488
Guns, traversing mechanism for machine, R. J. Gatling	105	145,573
Hammer, drop, J. Tobin	60	145,601
Harness trace, R. Williams	72	145,708
Harvester dropper, J. S. Fowler	74	145,640
Hatchway, self-closing, W. P. Cherrington	79	145,626
Heater, feed water, G. W. Richardson	143	145,591
Heating air, and supplying boilers therewith, G. E. Hibbard	2	145,568
Hod, mason's, B. C. Monroe	4	145,675
Hoisting machine, J. Jones	79	145,657
Horses, detaching, I. L. Landis	72	145,662
Hubs, machine for boring, J. A. Newell	31	145,521
Ice, apparatus for cooling air and making, T. D. Kingan	58	145,659
Ice creeper, Johnson and Axford	16	145,656
Indicator, station, Newlin and Simmerman	42	145,583
Ingot mold, M. T. Mooney	33	145,677
Inhaler, medical, J. C. Parkinson	156	145,679
Inkstands, tool for molding, A. W. Brinkerhoff	68	145,619
Iron and steel, refining, I. M. Phelps	85	145,680
Iron and steel, preventing corrosion of, E. A. Fisher	35	145,496

	Class No.	Whole No.
Knitting machines, register for tubular, D. A. Lehman	89	145,509
Knife, drawing, M. Brooks	29	145,485
Ladder, step, A. W. O'Blenus	31	145,522
Lamp shade and drip cup, J. S. and T. B. Atterbury	90	145,548
Lamp shade supports, making, W. N. Weeden	90	145,702
Lamp wick, P. Martin	90	145,667
Lamps, slide pendants for hanging, J. A. Evarts	90	145,637
Lantern, magic, L. J. Marcy, (reissue)	157	5,686
Latch and door check combined, R. L. Omensetter	24	145,523
Lath machine, T. Brune	174	145,486
Lathes, tool holder for, L. Reder	100	145,684
Leather perforating machinery for harness makers, L. D. Woodmansee	72	145,543
Leather work, metal fastening material for, C. Kenniston	92	145,658
Lightning rods, coupling for tubular, J. W. Fritsch	163	145,641
Lithographic transferred print, O. P. Wolff	54	145,606
Locks, tumbler for permutation, E. W. Brettel	93	145,618
Mallet for driving tubes, &c., C. Stewart	29	145,537
Mast for vessels, hinged, J. E. Hammond	138	145,648
Mattress frame, wire, G. V. and W. I. Bunker	62	145,553
Mattress spring, D. N. Sellig	62	145,597
Medical compound, S. Field	98	145,560
Medical compound, S. Gilbert	98	145,498

Piles, means for sinking broken, E. C. Boobar	82	145,483
Placards, &c., suspending and exhibiting, Morrell and Moore	54	145,709
Planing the edges of sheet metal, machine for, G. B. Rundlett	100	145,593
Planter, cotton seed, Z. Carter	133	145,554
Planter, hand corn, Tracy and Platt	133	145,696
Planters, dropper for seed, H. H. Koeller	133	145,575
Plow, C. M. Clark	114	145,627
Portfolio, L. F. Raimond	146	145,683
Potassa, manufacture of bitartrate of, L. Adler	35	145,607
Press, cotton and hay, E. S. Collins	7	145,629
Printer's rules, machine for preparing, J. B. Bancroft	117	145,549
Printer's side stick and quoin, F. Keehn	117	145,574
Printing press, copper plate, T. S. Bates	117	145,610
Propellers, mechanism for operating screw, F. H. Tobias	139	145,697
Pump or blower, rotary, A. Brear	12	145,617
Pumps, condenser for steam, D. Stoddart	118	145,538
Punch for metal, hand, S. F. Leech	119	145,578
Punching and shearing machine, C. Swanson	119	145,694
Railway rail joint stiffener, H. Harding	120	145,649
Railway switch, E. Mercier	120	145,518
Railway switch, T. Newman	120	145,678
Railways, device for removing snow from, J. A. Bryant	121	145,623
Range, L. Meyer	154	145,674
Rein holder, L. Fawcett	72	145,559
Rice, machine for hulling, H. B. Stevens	57	145,693
Roadways, machine for removing snow from, G. Hart	122	145,566
Roofs, attaching slate to, D. Ryan	126	145,529
Roofing, cement for slate, H. Wheeler	126	145,705
Ruler, F. A. Combes	146	145,555
Sad and fluting iron, L. Mooney	45	145,676
Saddle tree, O. V. Flora	72	145,639
Saw gummer, L. Gibbs	131	145,643
Saw handle, W. Clemson	29	145,626
Saw mills, head block for, G. Zschech	130	145,712
Screw driver, S. R. Kneeland	29	145,506
Screw plate, T. L. Von Dorn	14	145,701
Scythe holder for rag cutters, E. D. Aldrich	109	145,475
Secretary, wardrobe, and bedstead combined, A. Weeks	62	145,703
Separator, seed, F. W. Mace	159	145,668
Sewing machine, J. A. House	134	145,570
Sewing machine, I. Manning	134	145,515
Sewing machine, E. F. Richardson	134	145,667
Sewing machine gage, G. C. Roberts, (reissue)	134	5,689
Sewing machine table, J. Bennor	134	145,612
Sewing machine tucker, J. H. Bean	134	145,488
Shafting, bearing for, P. J. Hardy	87	145,565
Shutter worker, T. and C. T. Rowe	94	145,698
Skate fastening, G. W. Barlow	143	145,551
Soda fountains, apparatus for charging, J. C. Kennedy	1	145,503
Sower, seed, B. Morse	133	145,520
Spark arrester, J. W. Seigh	94	145,596
Spark arrester for locomotive engines, Thornton and Buckland, (reissue)	94	5,687

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED DEC. 16, 1873.

Adler, L., Manufacture of bitartrate of potassa	145,607
Aldrich, E. D., Scythe holder for rag cutters	145,475
Allen, W., assignee	145,537
Ames, J., Jr., Machine for shaping brush woods	145,546
Anderson, J. H., assignee	145,690
Anderson, T. D., Straw cutter	145,476
Anderson, W. G., Window screen	145,547
Archer and Pancoast Manufacturing Company, assignee	145,632
Ashby, G., Making dovetails	145,477
Asamus, A., Magazine fire arm	145,478
Atterbury, J. S. and T. B., Combined lamp shade and drip cup	145,548
Atwater Manufacturing Company, assignee	145,633
Auld, D., Jr., Furnace door	145,608
Axford and Johnson	145,656
Baker, C. L. W., Brush holder	145,479
Baldwin, M., assignee	145,661
Bancroft, J. B., Machine for preparing printers' rules	145,549
Barlow, G. W., Skate fastening	145,551
Barlow, W. A., Culinary vessel	145,550
Barr, R. J., Steam trap	145,480
Bate, W. S., Wash stand faucet	145,609
Bates, T. S., Copper plate-printing press	145,610
Beach, R. C., and G. A. Berry, Window blind slat adjuster	145,481
Bean, J. H., Sewing machine tucker	145,488
Beekman, W. T., Railroad car elevating and transferring apparatus	145,611
Bell, C. S., assignee	145,620
Bellemere and Frontier	145,642
Benedict and Burnham Manufacturing Company, assignee	145,702
Bennor, J., Sewing machine table	145,612
Berry and Beach	145,481
Berthet, A., and P. Laberie, Fiber disintegrator	145,613
Blom, C., Jr., Ironing table	145,614
Bloodgood, F. W., Machine for making batting	145,615
Boobar, E. C., Sinking broken piles	145,483
Booth, O. W., Weather strip	145,616
Bourguignon, W., Bottle cover	145,484
Bowman, R. M. and W. H., Corn dropper	145,552
Bradley & Hubbard, assignees	145,637
Brear, A., Rotary pump or blower	145,617
Brettel, E. W., Tumbler for permutation lock	145,618
Briggs, F. M., assignee	145,600
Brinkerhoff, A. W., Tool for molding inkstands	145,619
Brooks, M., Drawing knife	145,485
Brown, C. D., and E. B. Denison, Manufacture of paper pulp	145,620
Brown, J. C. H., Chimney top	145,621
Brown, O. B., and H. G. Carey, Music blackboard	145,622
Brune, T., Lath machine	145,486

Bryant, J. A., Removing snow from railways 145,623
Buchtel, J., Photographic background 145,487
Buckland and Thornton, (reissue) 5,687
Bunker, G. V. and W. I., Wire mattress frame 145,538
Bush, S. H., Butter worker 145,624
Butler, W. C., Machine for breasting boot and shoe heels 145,625
Cable, G. W., assignee 145,534
Carey and Brown 145,622
Carter, Z., Cotton seed planter 145,554
Chambers, W. J., assignee 145,566
Cherrington, W. P., Self-closing hatchway 145,626
Chichester, F., Cradle, (reissue) 5,683
Clark, C. M., Plow 145,627
Clark, W. J., assignee 145,653
Clemson, W., Saw handle 145,628
Collins, B., assignee 145,631
Collins, E. S., Cotton and hay press 145,629
Collins, J., Rail for sliding doors 145,630
Combes, F. A., Ruler 145,555
Cooper, M. J., Button holder 145,556
Copeland, R. A., Plug on ferrule for stopping leaks in the tubes of steam boilers 145,631
Costello, A. B., Photographic background 145,557
Culver, O. E., and L. E. Moseley, Wash boiler 145,558
Cummings, P. D., Grinding machine 145,488
Dale, W., Illuminating vault cover, (reissue) 5,683
Day, G. W., Hot air furnace 145,489
Dean, L. H., Motor 145,490
Deavs, C., Center drop light 145,632
Deeble, J., Die for forming ox shoes 145,633
Denison and Brown 145,620
Dibble, S. J., Portable stove 145,491
Diehl, L. J., Bee hive 145,634
Dixon, E. and W., Buffing wheel 145,492
Duncan, G. W., Flood fence 145,493
Dunlap, G. M., Thill coupling 145,635
Duval, J., Breech loading fire arm 145,494
Eberly, D. B., Cultivator 145,636
Edson, J. B., Recording steam gage 145,495
Evarts, J. A., Slide pendant for hanging lamps 145,637
Farley, H. W., Elevated way 145,638
Fawcett, L., Rein holder 145,559
Feret and Schacher 145,689
Field, S., Medical compound 145,560
Fisher, R. A., Preventing the corrosion of iron and steel 145,496
Flora, O. V., Saddle tree 145,639
Foster, W. B., assignee 145 636
Fowler, J. S., Harvester dropper 145,640
Foye, W. H., Bill and paper file 145,497
French, R., Machine for making ox shoes 145,561
Frink, M. S., assignee 145,515
Friscia, F. A., Food or sauce 145,562
Fritsch, J. W., Coupling for tubular lightning rods 145,641
Frontier, P., and A. Bellemere, Watch chain 145,642
Gardner, D. P., assignee 145,648
Gatling, R. J., Traversing mechanism for machine guns 145,563
Gehring, J. D., assignee 145,509
Gibbs, A. W., Automatic catch for sliding doors 145,644
Gibbs, L., Saw gummer 145,643
Gilbert, S., Medical compound 145,498
Gilman, E. S., assignee 145,667
Graf, L., Machine for heeling boots and gaiters 145,645
Green, J. B., assignee 145,652
Greenleaf, A., Culinary tongs 145,564
Greenough, J. J., Gearing 145,499
Griffen, J. J., assignee 145,650
Gwynn, H., Carriage wheel 145,646
Hall, M. H., Machine for cutting leather for boot and shoe heels 145,647
Hammond, J. E., Hinged mast for vessels 145,648
Hardie, J. W., Stock and die 145,500
Harding, H., Railway rail joint stiffener 145,649
Hardy, P. J., Bearing for shafting 145,565
Harris, A., Dry gas meter 145,650
Hart, G., Machine for removing snow from roadways 145,566
Hartman, J. J., Adjustable reclining chair 145,651
Haseltine and Snow 145,692
Hawkins, G. C., Machine for buffing boots and shoes 145,501
Heerman, D., Telegraph transmitter 145,567
Hess, J. W., Car coupling 145,652
Hibbard, G. E., Heating air, and supplying boilers therewith 145,568
Hinds, W. H. H., Candlestick 145 502
Hitchcock, C., Coffee urn 145,653
Hitchings, C. F., Boiler for warming buildings 145,654
Holden, Lones, and Vernon 145 510
Holmes, J. F., assignee 145,657
Hopkins, E. R., Manufacture of illuminating gas 145,635
Hopkins and Dickinson Manufacturing Company, assignee 145,630
Houlding, T., Spinning mule 145,569
House, J. A., Sewing machine 145,570
Hudson, H., assignee 145,643
John, F. K., Spring, (reissue) 5,685
Johnson, C. H., and W. Axford, Ice creeper 145,656
Johnson, J. W., Cotton worm destroyer 145,571
Johnson, J. W., Cotton worm destroyer 145,572
Jones, H. C., Grain basket 145,573
Jones, J., Hoisting machine 145,657
Kesha, F., Printer's side stick and quoin 145,574
Keuiston, C., Metal fastening material for leather work 145,658
Kennedy, J. C., Apparatus for charging soda fountains 145,503
Kimball, E. A., Cut nail machine 145,504
Kingan, T. D., Apparatus for cooling air and making ice 145,659
Klein, C. C., Rotary engine 145,505
Kneeland, S. E., Screw driver 145,506
Koeller, H. H., Dropper for seed planters 145,575
Kuesener, E., Machine for forming pans 145,660
Kyser, L., Shoulder pad 145,661
Laberie and Berthet 145,613
Landis, I. L., Detaching horses 145,662
Lane, T., Fly trap 145,507
Lane, W. J., Coffee roaster 145,576
Larson, P. J., Sofa bedstead 145 508
Lash, J. S., Box 145,663
Latourette, D. L., Cleaning steam generators 145,577
Leach, S. F., Hand punch for metal 145,578
Lehman, D. A., Register for tubular knitting machines 145,509
Leighton, J. T. and D. R., Sleeping car 145,664
Linden, N., Stove pipe thimble 145,579
Lones, J. C. and J., C. Vernon, and E. Holden, Manufacture of carriage axles 145,510
Long, C. B., Machine for bending chain links 145,511
Loomer, L. H. and A. F., and L. M. Smith, Corset 145,665
Loomer, L. L., & Sons, assignees 145,665
Lusby, C. C., Fan 145,666
Mackay, P. N., Flux for treating ores and metals 145,579
Magee Furnace Company, assignee 145,512, 145,513
Magee, J., Hot air furnace 145,512
Magee, J., Hot air furnace 145,513
Malick, W., Till alarm 145,514
Manning, L., Sewing machine 145,515
Manwaring, H., Thill coupling 145,516
Marcy, L. J., Magic lantern, (reissue) 5,686
Martin, P., Lamp wick 145,667
Mase, F. W., Seed separator 145,668
Mason, J. L., assignee 145,479
Massey, W. W., Curtain fixture 145,669
Masury, J. W., Can for paint, &c 145,670
Maxson, W. P., Rotary engine 145,671
McIlhenny, G. A., Gas retort 145,672
McKay, R. E., assignee 145,476
Meare, H. A., Agricultural boiler 145,517
Mercier, E., Railway switch 145,518
Merriam, G. H., Automatic attachment for car couplings 145,673
Merrill, G. L., and O. F. Soule, Preserving green corn, &c. 145,581
Merritt, E., assignee 145,504
Meyer, L., Range 145,674
Miller, W. A., Book clamp 145,582
Misthorn, D., Die for forming rock drills, &c 145,519
Mitchell, W. B., Car coupling 145,584
Monroe, B. C., Mason's hod 145,675
Mooney, L., Sad and fluting iron 145,676
Mooney, M. T., Ingot mold 145,677
Moore, J. G., assignee 145,639
Moore and Worrell 145,709
Morrison, W. A., assignee 145,626
Morse, B., Seed sower 145,520
Moseley and Culver 145,558
Myers, J. B., assignee 145,612
Neff, J., Tree protector 145,585
Neilson, J. F., Water closet 145,586
Newell, J. A., Machine for boring hubs 145,581
Newlin, J. W., and J. S. Simmerman, Station indicator 145,583
Newman, T., Railway switch 145,678
O'Blenus, A. W., Step ladder 145,522
O'Brien, W. S., assignee, (reissue) 5,684
Ockington, B. B. and A. J., Machine for making clothes pins 145,587
Omsonetter, R. L., Combined latch and door check 145,523
O'Neill, J., Car mat 145,588
Parker, G. C., Boot 145,589
Parkinson, J. C., Medical inhaler 145,679
Person, W. E., Bit brace 145,524
Perkins, L., Locomotive, portable, and other steam engines 145,525
Phelps, L. M., Refining iron and steel 145,680
Pierce, E., assignee 145,648
Platt and Tracy 145,606
Potter, A. J., assignee 145,701
Poulsen, J., Nail plate feeder 145,681
Quackenbush, H. M., Steam generator 145,682
Raimond, L. F., Portfolio 145,683
Rappleye, J. W., Constructing wire fences, (reissue) 5,688
Reder, L., Tool holder for lathes 145,684
Rolling, A., Bridge 145,685
Renaud, E., Welding copper 145,686
Rhinelander, F. W., Boot and shoe tip 145,590

Savoral, E., Lamp stove 145,531
Schacher, C., and L. Feret, Furnace 145,689
Schaefer, G. A., Adjustable reclining chair 145,595
Schmoele, W. F. and H., Jr., Electro-pneumatic action for musical instruments 145,532

Schnauts, E., assignee 145,531
Schulenburg, C., Billiard table 145,533
Seigh, J. W., Spark arrester 145,596
Sellig, D. N., Spring mattress 145,597
Sevey, J. A., assignee 145,539
Shepard, H. W., Safety valve for steam boilers 145,534
Shoe Machinery Manufacturing Company, assignee 145,501
Simmerman and Newlin 145,583
Sisson, J. E., Cultivator 145,535
Skinner, D. S., Cotton bale tie 145,536
Slusser, G., Cultivator 145,690
Smith, A. C., Cultivator 145,691
Smith, C. H., assignee 145,567
Smith, J. D., Numbering machine 145,598
Smith and Loomer 145,665
Smock, D. P., assignee 145,519
Snow, L., and J. Haseltine, Child's carriage 145,692
Soule and Merrill 145,581
Squier, G. L., assignee 145,693
Starbuck, B. and G. H., assignees 145,591
Stevens, H. B., Machine for hulling rice 145,693
Stewart, C., Mallet for driving tubes, &c 145,537
Stoddart, D., Condenser for steam pumps 145,538
Stoops, N. D., assignee 145,619
Strowbridge & Co., assignees 145,606
Swamscot Machine Company, assignee 145,593
Swanson, C., Combined punching and shearing machine 145,694
Taggart, J., Machine for splitting whalebone or rattan 145,539
Taylor, G. B., Barrel tap and faucet 145,695
Taylor, J. P., Device for converting motion 145,599
Thayer, L. O., assignee 145,494
Thibault, M., Machine for cutting nails 145,696
Thompson, J. G., Car starter 145,600
Thomson and Tunnicliff 145,699
Thornton, W. McK., and T. A. Buckland, Spark arrester for locomotive engines, (reissue) 5,687
Tobias, F. H., Mechanism for operating screw propellers 145,697
Tobin, J., Drop hammer 145,601
Tracy, J. D., and J. F. Platt, Hand corn planter 145,698
Travis, J. H., Extension foot rest for chairs, (reissue) 5,690
Treadwell, N. P., assignee 145,655
Tubbs, T. J., assignee 145,614
Tufts, J. W., assignee 145,503
Tull, J. W., and J. W. Weston, Washing machine 145,602
Tunbridge, J., Amalgamating gold and silver 145,603
Tunnicliff, J. R., and J. L. Thomson, Tobacco stripping machine 145,699
Vacher, E., Fire proof building 145,700

Zellweger, J., Bridge column 145,545
Zschech, G., Head block for saw mills 145,712

The OFFICIAL GAZETTE of the United States Patent Office is published weekly by the Patent Office. It is printed by authority of an act of Congress, which provides for its gratuitous distribution to libraries at the rate of eight for each congressional district.

The GAZETTE contains the decisions of the Commissioner of Patents, and such decisions of the courts in patent causes as are believed to possess general interest to inventors and patentees.

During the past year a complete synopsis of foreign patent laws, prepared by members of the British Legation in foreign countries, has been printed in the GAZETTE. Also an epitome of the proceedings of the Vienna International Patent Congress, with the action of that body to perpetuate itself. Matters of this character will receive further attention in the GAZETTE.

The claims of all patents granted are printed in the GAZETTE, bearing the same date as the issue of the patent, accompanied by a brief synopsis of the invention and a portion of the drawing.

The illustrations are photographic reproductions on a reduced scale of the drawings accompanying the original application, and preserve their fidelity, which was sometimes lost under the old plan of drawing or tracing and engraving.

Applications for extension of patents, and the action of the Office in such cases, have their earliest publication in the GAZETTE. Disclaimers filed in the Office are nowhere else published.

Changes in the rules of practice of the Office are announced in the GAZETTE, which affords a much readier mode of communication with parties interested than to await a new edition of the Rules of Practice.

Finally, any matter believed to be of interest to inventors in their official intercourse with the Office, will receive in the GAZETTE the attention the subject warrants.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

BOUND VOLUMES OF PATENTS.

The Office is now prepared to furnish to subscribers the monthly volumes of patents at $125.00 per annum, bound in half-sheep.

In these volumes the specifications are in full, the type of the same size as the printed patents and records; the drawings are in full, but are one-half the size (linear) of those attached to the patents and bound up for record; the illustrations are four on a page, but *fac-similes* of the originals, with the headings and signatures.

The volumes are the same size as the patents and the OFFICIAL GAZETTE, and have an average of 600 pages of specifications, 266 of drawings; total of each, volume about 1,000 pages. They commenced with the issue of July 2, 1872, being the successors in this form of the weekly volumes of patents published under the joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, and provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. Under this resolution the volumes were to be placed for free public inspection in the capital of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorized by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

After filling the requisition as provided above, a surplus remains which the Commissioner now offers at the rate of $125.00 per annum—say, 1,000 pages per month: 9,600 pages of specifications, 3,120 pages of drawings—12,720 pages.

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)	6,500
SEWING-MACHINES and attachments	2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes	4,000
PRINTING; including presses, type, and printers' furniture.	2,500
FELTING and HATS; including caps, bonnets, flock, &c.	1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)	1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs	1,400
CARRIAGES and WAGONS	6,000
BRIDGES; including ferry-guards, girders and columns, piers	408
CARDING, CLOTH, CORDAGE, KNITTING, SILK, SPINNING, WEAVING	4,800
RAILWAYS, complete, about	3,500
ELECTRICITY, (in progress,) to July, 1871	888
TEXTILE, (in progress,) to July, 1871, about	4,800

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national-bank-notes, certificates of deposit, or post-office money-orders.

The following abbreviated forms of the Patent Office classification by subject-matter may be of assistance to persons ordering copies of specifications and drawings by class. Of course the classes vary somewhat in number of patents, and in following a branch of industry it may be necessary to group several classes to secure absolute completeness. These groupings will readily suggest themselves to the inventor or mechanic.

Copy of classification in full for the use of subscribers furnished on application.

COMMISSIONER'S DECISIONS.

R. A. STEWART.—*Extension.*

[*In the matter of the application of R. A. Stewart, for extension of patent No.* 22,590, *dated January* 11, 1859, *for* IMPROVEMENT IN CLARIFYING CANE-JUICE.—*Decided December* 12, 1873.]

An extension refused for want of novelty in the alleged invention. When a complete application for patent, in due form, has been accepted and acted upon by the Office, it is to be presumed that it sets forth a completed invention, and mere delay in prosecuting an application erroneously rejected, where it had not been withdrawn or expressly abandoned, would not, previous to the act of 1870, work abandonment.

LEGGETT, *Commissioner:*

This application for extension is made under authority of an act of Congress approved March 3, 1873, which authorizes the Commissioner of Patents to consider the case as if the patent had not expired.

The invention, as described in the patent, "consists in passing or disseminating, in any convenient manner, throughout the saccharine matter, sulphurous acid or gas produced by a slow combustion in a nearly closed retort of sulphur or common roll brimstone."

The inventor says—

There are obviously various modes of producing this gas and of disseminating it through the saccharine liquid, all of which are useful, and will involve the principle or character of my invention; and I leave to all the adoption of such of the obvious modes of effecting the object as may be preferred.

He then proceeds to describe the means or apparatus he prefers.

What he claims "as new in the defecation and clarification of cane-juice and other liquid or semi-liquid forms of saccharine matter, is disseminating throughout the same sulphurous gas or sulphurous-acid gas, for the purposes herein set forth."

It does not appear in evidence that the particular apparatus described has ever gone into use, although the mode of clarifying cane-juice by the dissemination through it of sulphurous gas has been extensively practiced, and that is the subject of the claim. The Examiner reports against the novelty of this mode of defecation, and refers to the patent of Brashear, granted December 6, 1859. It appears the application for this patent was filed in the Office February 27, 1851, and in May following, rejected for want of novelty.

The patent of Stewart, at present under consideration, was granted—inadvertently, as would seem from subsequent events—without an interference with Brashear's pending application. Soon afterward the widow of Brashear duly renewed this application, and while it was under consideration in 1859 it was mislaid and could not then be found, although it was afterward discovered. In the mean time a sworn copy of the original application was produced by Mrs. Brashear and admitted by the Office, and, upon it, after amendment, the patent was granted. It is necessary to examine and compare the original specification and the patent, as it is intimated in argument in behalf of Stewart that the amendments made in 1859 were suggested by Stewart's invention. The original statement of Brashear's invention was as follows:

The nature of my invention is the applying directly the fumes of sulphur to the cane-juice, or other liquids containing the saccharine principle, by means of which a cheap, perfect, and expeditious manner, the defecation and clarification, by precipitation, filtration, or skimming of the cane-juice or other substance containing the saccharine principle, may be effected.

In connection with this statement he described no apparatus, but suggested that appropriate mechanical means would be apparent, and that the juice or other liquid could be sufficiently impregnated by being made to fall in minute particles through a space of a few feet filled with the fumes, or that the fumes might be driven into the liquid by a force-pump. This clearly comprehends the idea of *disseminating* the sulphurous gas in the saccharine matter, which is all of the alleged invention of Stewart.

His original claim is "the direct application of the fumes of sulphur to the cane-juice or other liquid containing the saccharine principle," &c.

The statement of his invention in his patent is as follows:

The nature of my invention consists in subjecting sugar-cane juice or other saccharine liquid to the direct action of the fumes of burning sulphur, such liquid being employed in a diffused state, so that every portion of the whole body of liquid being operated upon is brought in contact with the same almost simultaneously, and thus a cheap and expeditious defecation and clarification, by either precipitation, filtration, or skimming of the juices, is effected.

The claim of his patent is—

Subjecting sugar-cane juice or other saccharine liquid to the direct action of the fumes of burning sulphur, such liquid being employed in a diffused state, as set forth, so that every or nearly every portion of the whole body of liquid is brought in contact with the same almost simultaneously, substantially as and for the purposes set forth.

No apparatus was definitely described in his patent by means of which his invention could be carried out, and this omission was afterward supplied by reissue. The original patent set forth that—

No description of the mechanical means of apulying it is deemed necessary, since it must be apparent they may be indefinitely diversified; suffice it to say that the juice or other liquid may be impregnated to the desired extent with the fumes by being made to fall, through a space (filled with the fumes) of a few feet, in minute particles.

It is obvious that the original statement of the invention, as above quoted, justified the claim originally granted, and it is equally obvious that that claim is a complete anticipation of the claim and alleged invention of Stewart. This application, therefore, must fail, as the Examiner has reported, for want of novelty in the invention, and it becomes unnecessary to consider any other question in the case. The Examiner suggests that the only way to avoid the conclusion that Stewart was anticipated is to regard Brashear's invention as "an abandoned experiment." This could not well be done, as the question was passed upon by the Office in granting the patent and reissue, and besides, when a complete application, in due form, for patent has been accepted and acted upon by the Office, it is to be presumed that it sets forth a completed invention, and mere delay in prosecuting an application erroneously rejected, when it had not been withdrawn or expressly abandoned, would not, previous to the act of 1870, work abandonment. But notwithstanding the want of novelty in Stewart's invention, it appears he has netted over $45,000 from it, which, perhaps, ought to be considered an adequate compensation, even if he were the first inventor.

The extension is refused.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, DISTRICT OF CONNECTICUT.

SARVEN *vs.* HALL & CO.

[*In equity.—Before Woodruff, Judge.*]

A patent for a carriage-wheel in which the spokes have tenons inserted in the hubs, and are sustained against pressure endwise by the shoulders of the tenons, and laterally by collars on each side bolted together, is infringed by a similar wheel in which the spokes are made tapering without shoulders, and enter into corresponding mortises in a solid collar and in the hub, and are sustained endwise on the inclined sides of the mortises.

The defendants were led into adopting this form in consequence of their employment of the shoulders having been urged by the patentee's counsel in a former suit as constituting the breach of the patent, and though an injunction was ordered against them, it was without costs.

[*John S. Beach, Samuel S. Fisher, Charles Keller,* and *Charles F. Blake,* for the complainant.

Charles R. Ingersoll, Benjamin F. Thurston, for the defendant.

WOODRUFF, *Circuit J.*

This suit is brought to restrain an alleged infringement of a patent for an "Improvement in Carriage-Wheels," reissued to the plaintiff, September 6, 1870, and on the 8th of June, 1871, extended for the term of seven years from the 9th day of June, 1871, on which day his original patent, granted June 9, 1857, expired. In a former suit between the same parties in this court, heard in December, 1871, and decided at the April term next following, it was held that the plaintiff's patent was infringed by a carriage-wheel which the defendant was then and theretofore manufacturing, and a decree was entered in favor of the complainant against the defendant for an injunction and account of profits, &c.

A change was thereupon made in the construction of the carriage-wheels manufactured by the defendant, which, on its behalf, is claimed to avoid the decree in the former case and the patent itself, and to relieve the defendant from the charge of infringement. The plaintiff, on the other hand, insists that notwithstanding such change the wheel which the defendant is now manufacturing infringes his patent, and upon that ground he has filed the present bill, and moves for an injunction to restrain the manufacture of such wheel.

In the former suit the defendant's wheel was held to infringe the second claim in the plaintiff's reissued patent, which is in these words—

Also a carriage-wheel constructed with a mortised wooden hub with tenoned spokes, and with flanges which embrace the faces of the spokes in the immediate vicinity of the hub, and are connected together so as to form a metallic band through which the spokes extend into the mortises in the wooden hub, substantially as before set forth.

The plaintiff was not held to have an exclusive right to the use of either of the distinct devices mentioned in this claim. Each was held upon the evidence to be old—that is to say, a carriage-wheel with a wooden hub, a carriage-wheel with a wooden hub and tenoned spokes, a carriage-wheel with flanges on each side of the spokes bolted together to assist in resisting lateral strain, and connected together by bolts so as to form a metallic ring through which the spokes passed, were neither of them new. But it was found and held upon the evidence that a carriage-wheel combining all these was the invention of the complainant, and was embraced within the above-recited second claim of his patent.

In respect to this combination, the wheel of the defendant differed from the plaintiff's only in this, that instead of flanges placed separately upon each side of the spokes and bolted together through or between the spokes, the flanges used by the defendant were cast in one piece, the annular sides being connected by cross-pieces which passed between each two spokes, thus forming what was appropriately termed a mortised annulus, through the mortises of which the spokes were driven and into the mortises of the hub. And it was insisted that, thus constructed, the double flange or

mortised annulus, by means of the tapering sides of the mortises therein which firmly grasped the spokes, served to bear the pressure or thrust, endwise upon the spokes, relieved the shoulder, bearing on or adapted to bear on the hub, and so constituted a distinct device from the mere flanges bolted together for resisting lateral pressure.

In relation to this point, expert witnesses were examined on the behalf of the complainant, and their testimony went very far to show that if the defendant's wheel had been constructed without shoulders on the spokes, bearing, or which in use might be brought to bear, upon the wooden hub, the wheel would not infringe the complainant's patent—as, for example, if the end of the spoke entering the hub were uniformly tapering. And on the argument of the cause much stress was laid by the complainant's counsel on the fact that the spokes in the defendant's wheel had, like those of the plaintiff, shouldered tenons, the shoulders passing through the metallic mortises and bearing on the wooden hub.

The court were of opinion that the circumstance that the sides of the openings in the mortised annulus were tapering so as to furnish an endwise bearing to the spokes, did not render it a distinct device in such sense as to relieve the defendant from the charge of using the patented combination; that in their use, and for the purpose for which the plaintiff's flanged collars are useful, the sides of the mortised annulus are identical in the office they perform—viz, to sustain the spokes against lateral strain; and that in the mechanical construction of the parts that perform that office, they are substantially the same. That the crosswise partitions and form of tapering mortises may be improvements upon the plaintiff's flanged collars bolted together, but the mortised collars do nevertheless operate, for all the purposes for which flanged collars are used, in precisely the same way. Conceding, for the purposes of the case, that the tapering sides of the mortises formed by the cross-pieces enabled the mortised collar to perform a function of which the plaintiff's collars were incapable—viz., to grasp firmly the end of the spoke and sustain it against the endwise pressure, it was none the less an equivalent of the plaintiff's flanged collar in all the functions, mode of operation, and construction of the latter, although by an additional feature it had also a further useful function; and as an equivalent in the combination it did not relieve the defendant from the charge of infringement.

Possibly this holding may be deemed in conflict with some observations in the opinion delivered in the Supreme Court of the United States in *Rees vs. Gould,* (15 Wallace, 187; 2 PATENT OFFICE GAZETTE, 624;) but it is certainly in no conflict with the actual decision made in that case, which involved no such question, and the opinion of this court in the former suit will govern the decision of the present motion.

On such former trial, however, the claim in behalf of the defendant was urged that the tapering sides of the mortises in the mortised collars were not merely auxiliary to the shoulders near the end of the spokes in resisting the endwise bearing, but that in fact such shoulders were unnecessary, that the mortises in the metallic ring, in fact, sustained all of that pressure, and examples, in which some of the spokes were not driven in so far that these shoulders reached the wooden hub, were exhibited in proof thereof. This was strenuously denied by the complainant and his witnesses, who claimed and testified that shrinkage of the spokes would render the support derived from the bearing of the shoulder upon the wooden hub indispensable, and that the instances in which the shoulder did not, in the examples produced, reach so far, were exceptional, and, in fact, merely occasional imperfections in the manufacture; otherwise why did the defendant make all his spokes with shouldered tenons?

It will be thus seen that on such former trial the question whether the defendant's wheel had tenoned spokes with shoulders thereon bearing upon the wooden hub to give greater strength to the spoke and sustain or assist in sustaining the endwise thrust or bearing when in actual use, was made to assume great apparent importance, and in view of the testimony of the complainant's experts above mentioned, and the apparent concessions of his counsel, it is not at all strange that the defendant was led to the belief that if he should construct spokes so that their shoulders should not bear on the wooden hub, and practically illustrate and verify in his new manufacture his claim that his mortised collar, by the tapering sides of the mortise, so grasped and held the spokes as in fact to sustain all of the endwise bearing or thrust, he should avoid any infringement of the complainant's patent. I cannot resist the impression that for this belief of the defendant the complainant and his witnesses and counsel are largely responsible. The defendant, therefore, after the decree, cut away, in part, the shoulders of the spokes thereafter used, by rounding off the corners, so that, as is now claimed, there is no shoulder at the head of the tenon which rests on the wooden hub.

The complainant, however, still insists that what remains constitutes a shoulder which, though it may be less effective, does nevertheless perform the office of a shoulder at the head of the tenon, whenever and so soon as by very slight shrinkage or for any other reason the spoke, by force acting endwise thereon, is driven, in the slightest degree, inward toward the center of the wheel. And the defendant, on the other hand, with his witnesses, denies that the spoke can be driven in so as to produce such bearing, the tapering sides of the mortises in the metallic collar being absolutely and invariably sufficient, as his wheels are constructed, to sustain the spoke against such force or pressure.

I shall not on this motion attempt to settle this disputed question. I thought, when considering the former case, and I now think, that undue prominence was given to the subject of the bearing of the shoulders of the spokes on the wooden hub, as compared with their bearing, whether more or less completely, upon the tapering sides of the mortises in the metallic ring.

That prominence arises chiefly out of the fact that the patented combination as described in the second claim of the complainant's patent is "a mortised hub with tenoned spokes, with flanges which embrace the faces of the spokes * * * so as to form a metallic band through which the spokes extend into the hub, substantially as before set forth," and out of the suggestion thereupon that there are no tenoned spokes in any proper sense, unless there be a shoulder at the head of the tenon bearing upon the substance or

object in which the mortise is made to receive the tenon. That this suggestion gives the ordinary meaning of the term "tenoned," is unquestionable, although the word "tenon" has not derivatively any such necessary inherent signification. But let it be assumed that in mechanics the word "tenoned" imports not merely a tenon to be inserted in a mortise, but, as a correlative or adjunct, a shoulder to sustain the thing tenoned against endwise pressure, as illustrated in tenoned posts inserted in the sill of a building, tenoned braces to strengthen an angle in a frame, and the like. There is no necessary or prescribed form either to the tenon or to the shoulder. The tenon may be straight, curved, or dovetailed. The shoulder may be rounded or square; it may be at a right angle with the tenon, or at an acute or oblique angle.

Let it then be further assumed that the defendant has done that which the complainant denies—viz., so constructed the spokes in the new manufacture that their shoulders do not now bear on the exterior surface of the wooden hub.

What has the defendant done? The defendant's spokes have still both shoulders and tenons in the literal sense of the word. The shoulders are made not at right angles to the tenon; they do not bear directly on the wooden hub, but they do bear and do sustain the spoke against endwise pressure—the very office claimed for the shoulder of a tenon. They bear upon the superimposed metallic collar, and yet are within that collar and receive the same support against lateral strain which the flanged sides of that collar give, and are intended to give, and as the flanged collars do in the complainant's wheel.

True, the defendant, if it has in fact made the whole bearing-shoulder of its spokes bear on the tapering sides of the metallic mortises, has created a difference between its wheel and that of the complainant, but not a difference in office or in mode of operation. It has still tenoned spokes within the literal reading of the complainant's specification and claim, and tenoned spokes within the substance of the complainant's invention. True, they are not specifically like the spoke shown in the complainant's drawing, nor are they specifically like the tenoned spokes in an ordinary wheel; but, in considering the validity of the reissued patent, the court did not, on the former trial, deem the plaintiff, in the use of flanges in the combination in question, confined to spokes tenoned *as in the ordinary wheel*, as seemed on this argument to be assumed by the defendant's counsel. The language of the opinion may have tended to mislead, but the ordinary wheel was only mentioned for illustration. The original patent declared that the patentee claimed the use of the flanged collars, when used in connection with a wooden hub, if the spokes are arranged as therein set forth, or in any other manner—a claim doubtless too broad, but corrected in that respect in the reissue. I cannot, therefore, resist the conclusion that, within the substance of the plaintiff's second claim, the defendant's spokes are tenoned spokes, and therefore as truly within this second claim of the complainant's patent, whether the endwise pressure upon the spokes is received and borne upon the tapering sides of the metallic mortises or on the exterior surface of the wooden hub.

There is another view of the subject, which involves the doctrine of equivalents in a combination which tends to the same conclusion, unless the observations made in the case of *Rees* vs. *Gould*, above cited, be deemed to impair its force. The complainant is entitled to the exclusive use of the combination described in his second claim. The several devices combined by him were, as heretofore held, none of them new. Among those devices are tenoned spokes; and let it be conceded that by tenoned spokes he must be deemed to mean spokes having a shoulder at the head of the tenon resting on the wooden hub, and that the defendant places the shoulder of its spokes on the inclined or tapering sides of the metallic mortises, it might place the shoulder on a distinct projection within those mortises. Is it not obvious that, having regard to the purpose of a shoulder on the spoke, the function it performs, the mode of its operation to receive and sustain the endwise pressure, which are claimed to be the sole purpose, function, and operation of the shoulder, the defendant's construction is a precise equivalent of that described and claimed in the patent. If a spoke tenoned into a wooden hub, and having a shoulder resting on the surface of the hub, were new and were patented, it is not possible that one who should place a metallic band around a wooden hub, and make a mortise therein, and a mortise in the wooden hub beneath, and insert the tenon in the mortise so that the shoulder should bear either squarely or obliquely on the metal, could escape the charge of infringing such patent.

On the argument of the motion I was much impressed by still another view of the subject. Looking at the whole specification and construing the claims of the patentee by aid thereof, it will be seen that the invention had reference to improving the carriage-wheel in two important particulars — viz., strengthening the wheel so as to resist lateral strain, and strengthening it against force or strain in the direction of its plane. The patentee did not profess to have improved its capacity to resist the bearing or thrust endwise of the spokes; this was no part or purpose of his invention. By means of the circular flanges bolted together, the increased strength to resist lateral strains was to be effected, and by these metallic circular bands made fast to the hub and bolted to the spokes, and by making the spokes to form a solid or continuous belt of wood around the exterior of the wooden hub, the greater power to resist a strain in the direction of the plane of the wheel was to be secured, and in reference to either result, tenons inserted in mortises in the wooden hub were of essential importance. By his arrangement no strain either laterally or in the direction of the plane of the wheel could be made to act on the tenon of one spoke only, but by the joint power or efficiency of the metallic bands and tenons, several tenons acted together to resist any force, jar, or shock from any direction. When, therefore, the patentee had described his invention, and made his second claim, including tenoned spokes, the claim should be construed with reference to the office or function which entered into his improvement, and with reference to the services done by the tenon in its relation to the parts which constituted an improvement, and enabled the wheel better to resist force applied laterally or in the direction of the plane of the wheel. This was all he professed to have improved. For that purpose it was the tenons entering the hub and made fast therein that entered into his

combination as rendering service toward effecting his improvement. The endwise thrust was not in his contemplation, or the shoulders at the head of the tenon, as pertaining to any improvement made by him. True, there must be capacity to resist such end thrust. One mode of constructing a wheel which would give it greater power in that respect he had very prominently, and, as suggested in the former opinion, I think, chiefly in view—viz., increasing the number of spokes. But as to the matter of tenoning the spokes the point was to so unite the spokes that any strain upon one instead of acting on one alone should, through the tenons inserted in the hub and the circular flanges, bolted to all, be resisted by the joint power of several or all of the tenons. Hence his improvement was applicable to any wheel having spokes tenoned into the hub, entirely irrespective of the question whether the shoulders at the head of the tenon rested on the surface of the wooden hub, or whether any other provision was made to sustain the endwise pressure. The hold of the spokes in the hub was the efficient means of making his improvement practically useful, and constituted the marked distinction between his wheel and the wheel described in the Smith and Parfrey patent, in which there were no spokes inserted in mortises in the hub. In this view of the proper meaning of "tenoned spokes" in the claim of the patentee, there remains no question that the defendant's present manufacture is an infringement. The tenons at the end of the defendant's spokes are identical in form with the tenons in the wheel of the complainant's; they are secured in the mortises in the wooden hub in the same manner, and in their action, conjointly with the circular metallic band, they perform precisely the same office or function in resisting strains either laterally or in the direction of the plane of the wheel.

The particular mode in which the shoulder above is formed or how it is sustained, is, with reference to that which constitutes the substance and gist of the complainant's invention, immaterial, so long as the rings or flanges are made to bear upon or against the body of the spoke and bind it so as to effect the objects the patentee disclosed and secured. These reasons all concur in the result that the complainant's motion should be granted. The question of costs is not very important, but in view of the manner in which I think the defendant has been misled into the situation in which I deem him now placed, which in my judgment falls but little short of estopping the complainant to allege that a wheel without tenons, having shoulders bearing on the surface of the wooden hub infringes his patent, I cannot charge the defendant with costs.

U. S. CIRCUIT COURT—DISTRICT OF MASSACHUSETTS.

ELIZA WELLS, ADMINISTRATRIX, *vs.* IRA GILL *et al.*

[*In equity.—Before Shepley, Judge.—Decided November 6, 1873.*]

Edward N. Dickerson, for complainant.
H. F. French and *A. L. Soule*, for defendants.]

SHEPLEY, *J.:*

Upon a full hearing of this case and of the arguments of counsel, it is considered and adjudged by the court that the reissued patent introduced in evidence in this cause does not upon the face of the patent embrace anything not substantially described or suggested in the original patent to Henry A. Wells, and upon a careful revision of the evidence the court is of opinion and accordingly decides that Henry A. Wells was the original and first inventor of the several combinations claimed in the reissued patent, and that the same is a good and valid patent. And the court is of opinion that the differences between the machine of the defendants and that of the complainant are formal merely and not substantial, excepting that the defendants have introduced into their machine certain modifications of the exhaust current and of the combined action of the exhaust current with the current produced by the revolution of the brush or picker, which modifications are to be viewed only as additions to, or improvements upon, the devices embraced in the reissued Wells patent.

The judgment of the court is that the defendants did infringe as charged in the complainant's bill in this case, and for an injunction and account according to the prayer of the bill.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

26,891.—Catches for Spectacle-Cases.—Granted to GEORGE N. CUMMINGS, January 24, 1860. Application filed September 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,902.—Planing-Machines.—Granted to SOLOMON S. GRAY, January 24, 1860. Application filed October 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,906.—Stitches.—Granted to ALBERT F. JOHNSON, January 24, 1860. Application filed October 25, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,914.—Clothes-Wringers.—Granted to ROBERT O. MELDRUM and AMOS B. PAXSON, January 24, 1860. Application filed October 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,919.—Repeating Fire-Arms.—Granted to WILLIAM H. MORRIS and CHARLES L. BROWN, January 24, 1860, and reissued August 1, 1871. Application filed October 23, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,942.—Seats and Couches for Railroad-Cars.—Granted to THEODORE T. WOODRUFF, January 24, 1860. Application filed October 25, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,948.—Sewing-Machines.—Granted to ALBERT F. JOHNSON, January 24, 1860. Application filed October 24, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,952.—Lamps, granted to GEORGE NEILSON, January 24, 1860. Application filed October 18, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

27,008.—Machines for Attaching and Finishing Boot-Heels.—Granted to HERMAN SALOSHINSKY, January 31, 1860, and reissued March 26, 1867. Application filed October 28, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,020.—Variable Exhaust-Pipe for Steam-Engines.—Granted to GEORGE EDWARDS, January 31, 1860. Application filed November 1, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,023.—Calendar-Clocks.—Granted to EUGENE M. MIX and JAMES E. MIX, January 31, 1860. Application filed October 31, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,034.—Harvesters.—Granted to JOHN BUTTER, February 7, 1860; and reissued June 13, 1871. Application filed November 4, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,043.—Lock for Umbrella-Stands.—Granted to ALFRED M. FOOTE, February 7, 1860. Application filed November 8, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,065.—Coffee-Mills.—Granted to JOHN and EDMUND PARKER, February 7, 1860. Application filed October 9, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,094.—Machine for Making Cartridge-Cases.—Granted to ETHAN ALLEN, February 14, 1860, and reissued May 9, 1865, in two divisions, numbered, respectively, 1,948 and 1,949. Application filed November 11, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,135.—Sugar-Cutters.—Granted to CHARLES KINZLER and WILHELM ROSENBOCK, February 14, 1860. Application filed November 13, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,139.—Hanging Rudders.—Granted to JOSEPH P. MANTON and HENRY A. BILLINGS, February 14, 1860. Application filed November 10, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,179.—Marking-Gages for Sewing-Machines.—Granted to CALVIN D. WHEELER, February 14, 1860. Application filed November 14, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,185.—Soldering-Irons.—Granted to ABNER BURBANK, February 4, 1860. Application filed November 8, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,241.—Photographic Cameras.—Granted to AUGUST SEMMENDINGER, February 21, 1860. Application filed November 20, 1873. Testimony closes January 20, 1874. Hearing February 4, 1874.

27,291.—Seed-Planters.—Granted to JOHN S. HUGGINS, February 28, 1860. Application filed November 24, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,297.—Couches for Railroad-Cars.—Granted to EDWARD C. KNIGHT, February 28, 1860. Application filed November 29, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,303.—Fastening Saw-Handles.—Granted to JACOB NEIMEYER, February 28, 1860. Application filed November 28, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,319.—Machine for Bending Sheet Metal.—Granted to ORSON W. STOW, February 28, 1860; and reissued August 4, 1868. Application filed October 29, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,337.—Table-Cutlery.—Granted to JOSEPH W. GARDNER, March 6, 1860. Application filed December 3, 1873. Testimony closes February 3, 1874. Hearing February 18, 1874.

27,392.—Machine for Folding and Pasting Paper.—Granted to GEORGE K. SNOW, March 6, 1860. Application filed December 3, 1873. Testimony closes February 3, 1874. Hearing February 18, 1874.

27,403.—Steam and Fire Regulators.—Granted to JOSEPH WOODRUFF, March 6, 1860. Application filed December 5, 1873. Testimony closes February 3, 1874. Hearing February 18, 1874.

27,406.—Cultivators.—Granted to ROBERT CRAIG, March 6, 1860. Application filed November 22, 1873. Testimony closes February 3, 1874. Hearing February 18, 1874.

27,438.—Blackwashing-Molds for Casting.—Granted to WILLIAM FERGUSON and DAVID FERGUSON, March 13, 1860. Application filed December 10, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

27,447.—Chain for Timber-Bending Machines.—Granted to LEVI HEYWOOD, March 13, 1860. Application filed December 13, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

27,456.—Machines for Covering the Springs of Skeleton Skirts.—Granted to JOHN T. LOFT, March 13, 1860. Application filed October 6, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

27,478.—Turning-Lathes.—Granted to WILLIAM SELLERS, March 13, 1860. Application filed December 13, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

27,485.—Lanterns.—Granted to AUGUSTUS TUPTS, March 13, 1860. Application filed December 12, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

27,545.—Pitting Sinks.—Granted to JAMES INGRAM, March 20, 1860. Application filed December 15, 1873. Testimony closes February 17, 1874. Hearing March 4, 1874.

27,594.—Sewing-Machines.—Granted to L. W. LANGDON, March 20, 1860. Application filed December 13, 1873. Testimony closes February 17, 1874. Hearing March 4, 1874.

27,609.—Wringing-Machines.—Granted to SELDEN A. BAILEY, March 27, 1860. Application filed December 24, 1873. Testimony closes February 24, 1874. Hearing March 11, 1874.

27,626.—Sewing-Machine Stitch.—Granted to JAMES DAVIS, March 27, 1860. Application filed December 27, 1873. Testimony closes February 24, 1874. Hearing March 11, 1874.

27,627.—Cultivators.—Granted to CYRUS M. HALL and DAVID E. HALL, March 27, 1860, and reissued October 14, 1873. Application filed December 20, 1873. Testimony closes February 24, 1874. Hearing March 11, 1874.

27,631.—Tobacco-Screws.—Granted to NATHAN HOAG and WILLIAM H. TAFFEY, March 27, 1860. Application filed December 26, 1873. Testimony closes February 24, 1874. Hearing March 11, 1874.

27,634.—Plows.—Granted to GEORGE W. HUNT, March 27, 1860. Application filed December 26, 1873. Testimony closes February 24, 1874. Hearing March 11, 1874.

27,641.—Harvesters.—Granted to FRANK T. LOMONT and JOHN GROJEAN, March 27, 1860, and reissued June 11, 1872. Application filed December 20, 1873. Testimony closes February 24, 1874. Hearing March 11, 1874.

27,656.—Horseshoe-Nail Machines.—Granted to WILLIAM TALLMAN, March 27, 1860. Application filed December 15, 1873. Testimony closes February 24, 1874. Hearing March 11, 1874.

27,735.—Grinding-Mills.—Granted to EDMUND MUNSON, April 3, 1860. Application filed December 29, 1873. Testimony closes March 3, 1874. Hearing March 18, 1874.

27,743.—Feed-Water Arrangement for Steam-Boilers.—Granted to THOMAS SNOWDON, April 3, 1860. Application filed December 16, 1873. Testimony closes March 3, 1874. Hearing March 18, 1874.

28,004.—Railroad-Car Axles.—Granted to JAMES MONTGOMERY, April 24, 1860. Application filed December 17, 1873. Testimony closes March 24, 1874. Hearing March 8, 1874.

28,269.—Bayonet-Scabbards.—Granted to EMERSON GAYLORD, May 15, 1860. Application filed December 19, 1873. Testimony closes April 14, 1874. Hearing April 29, 1874.

30,467.—Apparatus for Singeing Pigs.—Granted to ABRAHAM and EDWARD M. DENNY, October 23, 1860. Patented in England February 2, 1860. Application filed October 17, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

31,262.—Fare-Boxes.—Granted to JOHN B. SLAWSON, January 29, 1861. Patented in England January 16, 1860. Application filed October 7, 1873. Testimony closes December 16, 1873. Hearing December 31, 1873.

EXTENSIONS GRANTED.

26,564.—Improvement in Top-Props for Carriages, granted to GEORGE COOK and HANNIBAL L. KIMBALL, December 27, 1859.

Claim.—The combination of the thimble or pipe *e* or *g* with the screw-bolt or standard *a* or *b* and the joint-bars B B or C, when the whole is constructed and used substantially as herein described.

26,582.—Improvement in Harvesters, granted to JOHN GORE, December 27, 1859; reissued January 15, 1861, numbered 24. (Whole No. 1,129.)

Claim.—1. The use of the lever M', constructed as described, in combination with the tapering draw-bar D, for elevating the cutting apparatus of harvesters, in the manner described.

2. The adjustable box J, constructed as described, in combination with the connecting-rod *a* and cutting apparatus, and operating as set forth.

Disclaimer filed December 15, 1873.

Disclaims second clause of claim, as above set forth.

26,584.—Improved Machine for Planing Curved Surfaces, granted to J. B. GROSVENOR, December 27, 1859.

Claim.—1. The employment or use of the adjustable or yielding feed-rollers L L, when combined with a bearing-roller, M, or a proper bearing-surface, and arranged, relatively with each other, as herein shown and described, to admit of the feeding of circular, oval, and serpentine forms to the cutters.

2. Placing the rollers L L in an adjustable frame or box, G, fitted in an adjustable box, E, and used in connection with the elastic bars N N, or their equivalent, and the bearing-roller M, whereby the frame or pattern may be properly adjusted and retained in proper position between the rollers while being acted upon by the cutters.

26,599.—Improvement in Horse Hay-Rake, granted to SAMUEL LESSIG, December 27, 1859.

Claim.—The single-tree *g*, sliding bar 3, spring *n*, braces 6, axles *z*, bar 9, sleeves *r*, beam 8, braces *j*, slotted teeth-guides 4, rollers *c*, arms *f*, and connecting-bars *l l*, the whole being constructed and arranged for operation conjointly, as and for the purpose herein set forth.

26,614.—Improvement in the Manufacture of Porous Ware, granted to BRADFORD S. PIERCE and MASON R. PIERCE, December 27, 1859.

Claim.—The manufacture of porous drain-pipes and other vessels which require to possess the property of porosity, when formed from the ingredients set forth, and made to cohere by the process of tamping or other equivalent mode of pressure, as described, and receiving its porosity from the small proportion of water used in mixing the ingredients, as set forth and described.

26,627.—Improved Lathe Attachment for Cutting Veneers, granted to B. F. STUBTEVANT, December 27, 1859.

Claim.—1. Compressing the wood in the immediate vicinity of the edge of the knife by means of the presser-bar C, or its equivalent, arranged and operating substantially as set forth.

2. The cutters E E' E², or their substantial equivalents, for the purpose specified.

Disclaimer filed December 26, 1873.

Disclaims second clause of claim, as above set forth.

DISCLAIMERS FILED.

26,582.—JOHN GORE, Brattleborough, Vt.—Improvement in Harvesters.—Patent dated December 27, 1859; reissue No. 1,129, dated January 15, 1861. Disclaimer filed December 15, 1873. Disclaims:

"That part of the claim in said specification which is in the following words, to wit:

"'2. The adjustable box J, constructed as described, in combination with the connecting-rod *a* and cutting apparatus, and operating as set forth.'".

26,627.—BENJAMIN F. STURTEVANT, West Roxbury, Mass.—Improved Lathe Attachment for Cutting Veneers.—Patent dated December 27, 1859. Disclaimer filed December 26, 1873. Disclaims:

"The second claim in said above-named patent."

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date December 23, 1873.]

7,068.—Knob-Rose and Escutcheon.—WILLIAM GORMAN, New Britain, Conn., assignor to THE RUSSELL AND ERWIN MANUFACTURING COMPANY, same place. Application filed November 15, 1873. Term of patent 14 years.

7,069.—Canister for Teas, Coffees, &c.—SILAS A. ILSLEY, Brooklyn, N. Y.—A. Application filed November 18, 1873. Term of patent 7 years.

7,070.—Canister for Teas, Coffees, &c.—SILAS A. ILSLEY, Brooklyn, N. Y.—B. Application filed November 18, 1873. Term of patent 7 years.

7,071.—Harness-Trimmings.—RUDOLPH HOYER, New York, N. Y. Application filed November 1, 1873. Term of patent 7 years.

7,072.—Printing-Type.—WILLIAM H. PAGE, Norwich, Conn., assignor to WILLIAM H. PAGE & Co., same place.—Case B. Application filed October 27, 1873. Term of patent 7 years.

7,073.—Printing-Type.—WILLIAM H. PAGE, Norwich, Conn., assignor to WILLIAM H. PAGE & Co., same place.—A. Application filed October 27, 1873. Term of patent 7 years.

7,074.—Printing-Type.—WILLIAM H. PAGE, Norwich, Conn., assignor to WILLIAM H. PAGE & Co., same place.—C. Application filed October 27, 1873. Term of patent 7 years.

7,075.—Drawer-Pull.—AMOS SHEPARD, Southington, Conn. Application filed December 15, 1873. Term of patent 7 years.

7,076.—Lock-Cases.—LOUIS WIDMAYER, New Britain, Conn., assignor to P. and F. CORBIN, same place. Application filed December 3, 1873. Term of patent 7 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date December 23, 1873.]

1,578.—Hats.—ORRIN BENEDICT & Co., Bethel, Conn. Application filed December 12, 1873.

"'Snow-Flake.'"

1,579.—Hats.—ORRIN BENEDICT & Co., Bethel, Conn. Application filed December 12, 1873.

"'Cuba Libre.'"

1,580.—Hats.—ORRIN BENEDICT & Co., Bethel, Conn. Application filed December 12, 1873.

"'Clementine.'"

1,581.—Fertilizer.—LORENTZ & RITTLER, Baltimore, Md. Application filed December 12, 1873.

"a star-shaped figure with the firm-name."

1,582.—Dynamite Explosive Compound.—THE GIANT-POWDER COMPANY and THE ATLANTIC GIANT-POWDER COMPANY, San Francisco, Cal. Application filed November 15, 1873.

"'Dynamite.'"

1,583.—Giant-Powder Explosive Compound.—THE GIANT-POWDER COMPANY and THE ATLANTIC GIANT-POWDER COMPANY, San Francisco, Cal. Application filed November 15, 1873.

"'Giant Powder.'"

1,584.—Motto-Papers.—THEODORE VAN SKELLINE, Brooklyn, N. Y. Application filed December 13, 1873.

"figure of a butterfly with the letters 'T. V. S.' on its wings and body."

1,585.—Aniline Dyes.—WELLS, RICHARDSON & Co., Burlington, Vt. Application filed December 15, 1873.

"'Leamon's Genuine Aniline Dyes,' the figure of a woman, and the fac-simile of Thomas Leamon's signature."

1,586.—Soap.—JONES EAVENSON & SONS, Philadelphia, Pa. Application filed September 10, 1873.

"'Quaker City Soap, Eavenson & Sons,' and the figure of a man in Quaker costume."

1,587.—Liniment.—WILLIAM KIDDER, Goffstown, N. H. Application filed December, 17, 1873.

"'Mohawk' and the figure of an Indian chief."

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date December 23, 1873.]

ORIGINAL PATENTS.

145,713.—Drier for Lead.—ANDREW D. ARMSTRONG, Allegheny City, assignor to ARMSTRONG, FAWCETT & MCKELVY, Pittsburg, Pa. Application filed July 11, 1873.

The lower chamber is heated by steam, and the upper, in which is the substance to be dried, by hot air from a broad-mouthed blast-pipe.

Claim.—A stationary drying-tank, *a*, divided horizontally into two chambers, a^1 and a^2, the first being fitted with steam supply and discharge pipes *c* and *d*, and the latter with a broad-

mouthed blast-pipe, *g*, an exit, *f*, and a lid, *e*, substantially as described.

145,714.—Peg-Cutter.—CHARLES H. BACON, Boston, Mass., assignor to himself and J. H. SAWYER & CO., same place. Application filed November 20, 1873.

Claim.—The bent arm or casing A, inclined so as to accommodate the crimp and leg of the boot, and pass to the toe, in combination with the reciprocating cutter L with its operating mechanism, substantially as and for the purpose set forth.

145,715.—Try-Square.—LEONARD BAILEY, New Britain, Conn. Application filed July 9, 1873.

A screw with a conical swell passes through the stock and through a slot in the blade. When the screw is driven in, the conical swell bears against the edge of the slot and holds the blade firmly in position.

Claim.—The combination of the handle having a slot for the blade, the bottom of which is at a true right angle to the face side of the handle, the blade pierced with a hole for the screw with a conical swell, and the screw having a conical swell, all substantially as described.

145,716.—Combined Step-Ladder, Bench, and Clothes-Frame.—HAVILAH H. BARKER, Hartford, Conn. Application filed November 3, 1873.

Two frames are connected together by clamps and hinged and jointed legs, so as to assume several different forms.

Claim.—The combination of the frame *a a*^{1} *a*^{2}, provided with the pivoted legs *c c*^{1} *d d'*, with the frame *b b*^{1} *b*^{2}, having the legs *e e*^{1} *f f'* pivoted thereto, the corresponding sets of legs upon the two frames being hinged together, the whole constructed, arranged, and designed for operation and use, substantially as hereinbefore set forth.

145,717.—Method of Forming Receivers for Breech-Blocks of Fire-Arms.—ELBRIDGE G. W. BARTLETT, Providence, R. I., assignor to PROVIDENCE TOOL COMPANY, same place. Application filed August 11, 1873.

Claim.—The improvement in the art of manufacturing blanks for breech-block receivers, which consists in perforating, mainly by lateral displacement, a block of metal of lesser longitudinal dimensions than the finished receiver, and in extending said block longitudinally, and reducing it laterally and vertically, by means of a series of internal stretching or drawing tools applied consecutively, and compressing-tools applied exteriorly, in connection with interior resisting-tools, substantially as described.

145,718.—Quicksilver-Pump.—MARTIN P. BOSS, Bullionville, Nev. Application filed November 15, 1873.

The valves both open downward in chambers communicating with the barrel in which the solid piston works. The tray in which the pump stands is fastened to its support through hollow bolt-standards to prevent leakage.

Claim.—1. The pump A, with its induction and eduction pipes D L, in combination with the chambers E I, with their downwardly-opening valves F J, when the whole is constructed to operate substantially as and for the purpose herein described.

2. In combination with the pump constructed as described, the tray M with its hollow bolt-standards O, substantially as and for the purpose herein described.

145,719.—Triple-Cylinder Engine.—PETER BROTHERHOOD, Notting-Hill, England. Application filed October 20, 1873.

The triple-cylinder engine is provided with a central steam-chamber, into which steam is admitted by a central rotating valve to equalize the pressure on one side of the pistons. The steam is admitted alternately by the valve and suitable ports to the outer ends of the pistons, and operates them. The valve is operated by projecting cars, against which a projecting end of the crank-pin strikes.

Claim.—1. The combination of the cylinders A, central chamber B, pistons C, crank E, and valve G, controlling the passages *a*, substantially as described.

2. The several pistons C and their connecting-rods D, having each an independent connection with the crank-shaft, in combination with the chamber B, a steam-supply pipe for keeping the inner sides of the pistons under pressure, substantially as and for the purposes set forth.

3. The rotary slide G, having the projecting cars h^1 h^2 and spindle *m*, in combination with the crank-pin *e*, arranged between the two, and having a bearing against either at pleasure, substantially as described.

145,720.—Nail-Separating Device.—HARVEY B. CHESS, Pittsburg, Pa. Application filed December 9, 1873.

The screw *c* serves to adjust the dam *b* toward or from the spout A to make the opening between them any distance required.

Claim.—A device for sifting nails and tacks, consisting of the flat-bottom spout A, with its sides *a a*, in combination with the angular dam or breast *b*, adjusting-screw C, sliding hooks *e e*, and rods *d d*, all constructed and arranged substantially as and for the purpose set forth.

145,721.—Apparatus for Transferring Power.—ELIJAH B. CLARK, Cohoes, N. Y., assignor of one-half his right to MICHAEL ANDRAE, same place. Application filed April 20, 1872.

Power is transferred from the continuous revolving driving-shaft to the other shaft intended to be intermittently driven by means of the lever and cord, the former operating the movable bearing and its pulleys in one direction, while the spring will operate the same in the opposite direction.

Claim.—The combination of the fixed pulley F and band or cord *c c c* with the pulley G, rendered capable of being moved toward or from the fixed pulley, and the spring J or its equivalent, substantially as and for the purpose set forth.

145,722.—Preparing Cocoa-Nut for Use in Pies, Cakes, &c.—NELSON A. CLASSON, Windham, Conn. Application filed December 5, 1873.

Cocoa-nut, water, powdered sugar, and bicarbonate of soda. Take fresh-ground cocoa-nut and water and place together in a retort which is immersed in a vat of water which has been densified to highest boiling-point. Then heat the two ingredients to boiling-point. The whole is then taken out and pressed, which extracts all the oil, milk, and water. Keep the pulp at a gentle heat, and take the oil, &c., extracted and heat. When at or near the boiling-point, add bicarbonate of soda, which produces coagulation. Then separate the coagulum from the oil, &c., by pressing through flannel, and add the sugar to the residue, and continue to boil until the water is all evaporated and the sugar united, and then add to the cocoa-nut and continue boiling from four to six hours.

Claim.—The preserving of cocoa-nut in a moist and natural state by the process hereinbefore set forth, and for the purpose specified.

145,723.—Dredging-Machine.—WILLIAM A. COLLINS, Bloomfield, N. J. Application filed June 3, 1873.

The scoops are hung from a bar by loops or saddles, and, when first opened, move away from each other. When nearly at the end of their movement, they are caused to assume a position nearly at right angles to their former one. This mechanism gives them a wider opening than the ordinary mode of hinging at a single center. The movements are controlled by chains and a double set of wheel and axle pulleys.

Claim.—1. The scoops *a c'*, suspended by the saddles from the bar *b*, in combination with the chains and wheels, arranged substantially as set forth, for moving the scoops upon such bars and actuating them, as specified.

2. The arrangement of the two shafts *f*, chain-wheels, chains, and buckets, in the manner specified, for sliding the buckets *a c'* upon the bars *b*, and swinging the same, substantially as specified.

3. The scoops, drawn apart horizontally, and then swung into an inclined position, and receiving the reverse movement in closing, substantially as and for the purposes set forth.

145,724.—Saw-Set.—ROSWELL F. COOK, West Potsdam, N. Y. Application filed October 9, 1873.

The hooked extremities of the two branches of the U-shaped spring enter the one a notch in the short arm of the hammer-lever, and the other in any one of a series of notches in the frame, and by this series of notches the spring, which is compelled to vibrate with every movement of the hammer, may be adjusted to vary the force of the blow. The hammer is successively elevated and given the initial movement in the opposite direction by a hand-lever, which carries a pin that alternately strikes opposite shoulders of a recess in the surface of the hammer-lever.

Claim.—The combination, substantially as described, in a saw-set, of a notched frame and lever with a hammer having an oscillating spring for operating the same.

145,725.—Combined Tank and Liquid-Measure.—JOSEPH H. CORLISS, Reno, Nev. Application filed August 23, 1873.

A tank having an interior measuring-vessel, so arranged that when, by means of a single lever, the inlet-cock of the measure is opened and the outlet closed, or vice versa, corresponding air-tubes of said measure may be opened and closed by a three-way cock.

Claim.—In combination with the measure B and tank A, the cock G, with its passages H and I, stem D, operating-lever F, pipes K and L, and cock *m*, all constructed, arranged, and operating as described.

145,726.—Pressure-Gage.—GEORGE H. CROSBY, East Somerville, Mass. Application filed August 6, 1873.

Two links joined or pivoted together at one end, at which point they are connected with the ordinary transmitting mechanism, have their other ends spread apart and pivoted to the ends of Bourdon pressure-tubes, or, in case but one tube is used, the end of one of the links is pivoted to the case, by which means both the vertical and horizontal movement of the tubes is better utilized.

Claim.—In a pressure or vacuum gage, the means herein described for operating the index-shaft by both the upward or vertical as well as the horizontal movement of the Bourdon tube or tubes, the same consisting of two links joined or connected together at one end, with their other ends spread apart and pivoted separately, as specified, in combination with intermediate mech

anism transmitting the movement of said links to the index-shaft, the whole constructed and operating substantially in the manner shown and set forth.

145,727.—Hoisting-Machine.—JEREMIAH DARLING, Cincinnati, Ohio. Application filed October 13, 1873.

Claim.—The combination of the double and adjustable clutch, drums H H, hod-racks E E, platforms C C, and guides B B, constructed and operated as herein described.

145,728.—Corn-Planter.—JEROME S. DAVIS, Ithaca, N. Y. Application filed September 12, 1873.

A metallic bridle or link surrounds the two handles at their upper ends, limiting their spread, preventing strain upon the hinge and the side-inclosing material, and also serving to jar the seed out of the seed-slide.

Claim.—In a corn-planter, the combination, with the arms or handles *a a'*, seed-slide *g*, and recessed points *e' e''*, of a guide or bridle, *k*, for limiting the spread of the handles, substantially as shown and described.

145,729.—Hand-Mirror.—JAMES F. DOHAN, Binghamton, N. Y. Application filed September 24, 1873.

The metal front or rim is provided with teeth or brads on its under surface, so that such teeth may be forced into the back, and thereby hold the glass, front and back, firmly together.

Claim.—The metal frame D, provided with brads or teeth on its edge or under surface, in combination with the back A, pad C, and glass B, substantially as and for the purpose herein described.

145,730.—Carriage-Top.—DENNIS B. DORSEY, Chillicothe, Mo., assignor of one-half his right to ELI J. MARSH, same place. Application filed October 21, 1873.

Claim.—1. The combination of the pivot-hooks C C with the frame A A B B, covering G, and the top bow E, substantially as and for the purposes specified.

2. The attachment together of the wire bows A A and B B by means of the loops *a a* and *b b*, which constitute the frame for the covering G, substantially as and for the purposes specified.

3. The combination of the cord *d* with the frame A A B B, the pivot-hooks C C, and the screw-eye *f*, substantially as and for the purposes specified.

145,731.—Hose-Coupling.—JACOB EDSON, Boston, Mass., assignor of one-half his right to JOHN CLARK, same place. Application filed November 26, 1873.

The hose is attached to the coupling by slipping it over the shank, and placing the grooved sleeve over the hose so far that the projections engage in the recesses on the sleeve, and compress the sleeve in its open end by screwing the tapered nut around it.

Claim.—The combination of the tapering nut *a*, compressible sleeve *b*, and annular projection *c*, or its equivalent, for the purpose specified.

145,732.—Milk-Cooler.—CECIL GRAVES, GEORGE C. POWERS, and CHARLES O. GRAVES, Waterbury, Vt. Application filed August 7, 1873.

The siphon-pipes are to draw water from the bottom of the water-pan, and the surface-pipes to draw it from the surface, for the purpose of facilitating the rapid withdrawal of water.

Claim.—The combination of the supply-pipes *g g g* with the discharge-pipes *h* and *s s*, and the milk-pan A, as and for the purpose specified.

145,733.—Umbrella.—GOUVION G. GEISWOLD, New York, N. Y. Application filed October 8, 1873.

The neck of top notch has a groove or channel in which the head of a nail in the stick lies, holding the notch in place, but permitting it to rotate, so that the notches may be brought opposite a hole in the stick, by which each rib-head may be inserted.

Claim.—1. The top notch A, with its neck *a*, constructed as herein described, and adjusted upon and secured to the umbrella-stick B, in the manner and for the purpose herein described.

2. The double ribs C, constructed as described, and strengthened and secured together at or near their center by the lap E, the upper and lower ends of said ribs being twisted so as to form, at the lower end *b'*, a loop, to which the cover may be sewed or attached, and T-shaped projections, as at *b*, upon the upper ends of said ribs to connect with and be secured to the top notch A, in the manner and for the purpose herein set forth.

3. The indentations or depressions D formed upon the umbrella-stick, combined with the top and runner notches, to admit of the adjustment of the ribs and stretchers, in the manner and for the purpose herein described.

4. The combination of the lap E with the ribs C, in the manner and for the purpose herein described.

5. The combination of the top notch A, ribs C, and stick or handle B, constructed substantially as described, with the india-rubber spring or protector *c*, in the manner and for the purpose herein described.

6. The combination of the runner-notch G with the runner-pipe H, when secured together, in the manner and for the purpose herein described.

7. The disk K, provided with the raised projections *m*, substantially as described, so that when bent inward they may be driven into the stick B and secured thereto, in the manner and for the purpose herein described.

8. The disk J, forming either the top or running notch, constructed as herein described, so that the circular hole at its center has cut within it the dovetail opening *c*, and with the ends of each of the projections *z z z* scalloped or cut away, so that when bent inward they may form spaces into which the ribs and stretchers are inserted, in the manner and for the purpose herein described.

9. The disks forming the top and runner notches, to receive the ribs and stretchers of an umbrella with circular, spiral, or radial corrugations, as shown in Fig. 5 of drawing, in the manner and for the purpose herein described.

10. The within-described method of securing the notches G upon the stick and runner by means of the forked nail *h* and metal plate *i*, in the manner and for the purpose herein described.

11. The top and running notches, when constructed as described, in combination with depression D and nail *a'* in the stick, so that they may be rotated, and the spaces cut in said notches for the reception of the ribs and stretchers, can, at will, be brought opposite said hole or depression D, in the manner and for the purpose herein set forth.

145,734.—Toy Money-Box.—JOHN HALL, Watertown, Mass. Application filed April 24, 1873.

A coin being placed in the hand of the toy figure is automatically transferred to the side pocket and receptacle inside, with accompanying bows of the figure to imitate thankful gestures.

Claim.—1. The combination of the spring *n*, the weight *k*, and spindle *i* with the arm B, when said parts are constructed and arranged substantially as described.

2. The hollow figure of a man provided with the arm B, the pocket-hole *d*, the head and spindle *e*, arm *f*, and trigger-wire *m*, when arranged to operate substantially as described.

145,735.—Manufacture of Cigar-Boxes from Redwood.—CHARLES A. HOOPER, San Francisco, Cal. Application filed November 15, 1873.

Claim.—Cigar-boxes made of California redwood, (*Sequoia*,) steamed or boiled, substantially as described, as a new manufacture.

145,736.—Ditching-Machine.—JAMES W. HUMPHREYS, Oxford, Ind. Application filed May 23, 1873.

The cutter is adjustable vertically, and is connected to an inclined chute provided with an endless carrying-belt which receives motion, through intermediate gearing, from a driving-wheel on one of the axles of the machine. The journal-bearing of the upper roller of the belt is in a movable seat, which allows the chute and belt to accommodate themselves to the adjustment of the cutter. Knives are secured to the rear edge of the cutter, and are adjusted on notched bars at the side of the machine so as to cut the sides of the ditch obliquely, aprons being provided to throw the earth out onto the chute.

Claim.—1. In combination, the chute G, adjustable cutter F, counter-shaft P, connected with the driving-wheel B by gearing M N O, and the movable seat L provided with suitable gearing, as I J Q R S, substantially as and for the purpose hereinbefore set forth.

2. The knife T, provided with the apron V, in combination with the adjustable cutter F, chute G, and rack W, substantially as and for the purpose hereinbefore set forth.

145,737.—Spading-Machine.—JOHN G. JONES, Falmouth, Mass. Application filed April 7, 1873.

A spade and handle of the same general form as a hand-spade is attached at the blade to a crank geared from the traction-wheels. A thimble at the top of converging standards serves to keep it in an upright position. A gear-plate on the crank has catches which engage with a pin. By removing the pin the spading device is thrown out of gear.

Claim.—1. In a spading-machine, the combination of the vertically-arranged spade *a*, pivoted to the crank C, having balance-wheel *b*, and operated by the pinion-wheels *p p* gearing in the driving or traction wheels B B, with the braces *d* and thimble *c*, all arranged and operating as hereinbefore set forth.

2. The combination of catches upon the inside of the pinion-wheels *p p*, and of the spring-head linch-pins *s s*, by the insertion or removal of which the machine is put into or out of gear, as hereinbefore set forth.

145,738.—Combined Step-Ladder and Ironing-Board.—HILAND H. KENDRICK, Fulton, assignor of one-half his right to JOHN W. THROOP, Syracuse, N. Y. Application filed November 6, 1873.

Two pairs of legs are pivoted together near the middle of their length, one having steps and the other a shelf or landing-step. A notched brace and an ironing-board are connected with them. Elastic loops and hooks hold the latter in place.

Claim.—1. The step-ladder composed of two frames, A B, one bearing the landing-step and the other bearing the flight of steps, the two being pivoted together near the center of each, arranged and operating substantially as and for the purpose herein specified.

2. The combination of the step-ladder, constructed with the two swinging frames A B, and provided with the notched brace D and the ironing-board E, constructed as described, together forming an ironing-table, substantially as and for the purpose herein specified.

3. The combination of the elastic loops *l l* on the ironing-board E and the hooks or pins *m m* on the step-ladder, substantially as and for the purpose herein specified.

145,739.—Apparatus for Binding Stalks.—SOL KUH, Jefferson, Iowa. Application filed April 8, 1873.

Stalks to be bound are clamped between two corrugated plates. Said plates are drawn together by screw-bolts passing from one through the other and held by nuts. One of the plates has a

flanged base and rings for holding the plates upright to detachable legs.

Claim.—The corrugated plate A, provided with a base, a, rings c, bolts d, plate B, nuts i, and detachable legs E, provided with slits, all combined together as and for the purposes described.

145,740.—Water-Wheel.—JOHN KUNKLE, Newton Falls, Ohio. Application filed November 4, 1872.

The buckets are constructed with closed sides and a deep open mouth with curving corners, so that no water can escape from the sides, and therefore act directly upon the wheel in the line of rotation. A conical hub prevents the water from lodging upon it, but flows down to the buckets and escapes.

Claim.—1. The wheel A, having its buckets constructed with closed sides E and deep open mouth D, curved corners D', and conical hub C, in the manner as described, and for the purpose set forth.

2. The wheel A, scroll or flume G, curb F, and wooden boxes J, all constructed, arranged, and combined in the manner as described, and for the purposes specified.

145,741.—Sofa-Bedstead.—ENOCH LORD, Portland, Me. Application filed September 11, 1873.

One bottom and head-rest lie on others, the arm-rest of the upper one folding downwardly outward to secure a bearing. The whole adapted to unfold on a longitudinal line of hinges in front to form a bedstead.

Claim.—The combination of the movable frame B, with its head E, hinges m, latch h, and face-piece n, with the fixed frame A and the back of the sofa, which has the ledge r and cleat k, as herein set forth.

145,742.—Razor-Strop.—JOHN B. LUCAS, Portland, Me. Application filed April 19, 1873.

The strop is composed of two thin strips of wood united to form the handle and wound with leather. The leather passes over the outer ends of the wood strips, which hold them together at that point.

Claim.—The razor-strop composed of the two thin sheets of wood D E, united to form the handle A, as set forth, said strips being wound with leather, as herein described.

145,743.—Sectional Steam-Generator.—JOHN D. LYNDE, Philadelphia, Pa. Application filed September 4, 1873.

A system of pipes connected to manifolds form the sides of the furnace, and are combined with a series of pipes on sides and connecting to a cylinder arranged over the top of the whole, the object being to utilize the heat that usually impinges on the sides of the walls, and also to create a better circulation. A receiver is provided for the ready removal of the sediment, &c.

Claim.—1. The combination of the pipes C C C and manifolds B and B', with cylinder K and pipes D E, constructed and arranged substantially as and for the purpose described.

2. The combination of the pipes C C F F and cylinder K with receiver N, constructed substantially as herein described.

145,744.—Heating-Stove.—ISAIAH G. MACFARLANE, Pittsburg, Pa. Application filed September 23, 1873.

A fire of coke or other light fuel is made on grate c, and another of bituminous coal is made on grate b. The smoke and gases rising from the lower fire are consumed in the other.

Claim.—1. The grate c, constructed of fire-clay or other infusible material, having flues c^1 extending to the center openings c^2, substantially as and for the purposes described.

2. The grate c, having flues c^1, in combination with the fire-chamber d, having ports g, and a grate, b, substantially as described.

145,745.—Toy Gun.—WILLIAM MILLS and DANIEL J. WOLFE, Jersey City, N. J. Application filed May 29, 1873.

At the base of the barrel is an orifice to allow the escape of gunpowder and prevent its use therein. The stop-pin serves also (by projecting a little on top) the purpose of a sight.

Claim.—1. A toy gun having the safety-opening c, arranged substantially as and for the purpose specified.

2. The forward sight-pin d, passing through the barrel A, substantially as and for the purpose herein set forth.

145,746.—Car-Coupling.—GEORGE R. MOORE, Philadelphia, Pa. Application filed September 25, 1873.

The pin is raised by means of the lever B, and retained by the cross-bar b of a plunger actuated by the link. The link is guided by means of a clamp, which is operated by the lever C. This clamp holds the link firmly against the pin and at the proper degree of inclination.

Claim.—1. The plunger a, having cross-bar b and the lever B pivoted at the rear of the draw-head, in combination with the spring g and the pin e, as set forth.

2. The lever C and ratchet f, in combination with the clamp d and arm i of the lever B, as described.

145,747.—Machine for Making Cord.—EDMOND OTIS, New Haven, Conn., assignor to JOHN PECKHAM, same place. Application filed September 16, 1873.

The single stationary shaft supports all the strand-delivering, twisting, and take-up devices.

Claim.—The stationary shaft A, combined with and supporting both the strand-bobbins D and the rotating laying-frame C and take-up devices, as shown and described.

145,748.—Device for Forming Cores.—HENRY PARKER, Gananoque, Canada. Application filed November 18, 1873.

The cores are produced by closing the flask and uniting the semi-cores formed in the two-part mold.

Claim.—1. A mold for casting cores having flasks B, impressed with corresponding semi-core molds D, inserted removably in a case, A, formed of dishes a a', hinged and closing together substantially as and for the purpose described.

2. Providing the dishes a a' of the case A with openings C at the back, to facilitate removal of the flasks B by pressure, as set forth.

145,749.—Medical Compound or Eye-Wash.—FRANZ PAWLEWSKI and JOHN SCHULZ, Milwaukee, Wis. Application filed June 20, 1873.

Chloride of sodium, sulphate of zinc, oxide of zinc, carbonate of zinc, fennel-water, and chelidonium-water.

Claim.—An eye-water compounded from the ingredients above named, and in about the proportions as described.

145,750.—Weather-Guard.—JAMES PEASE, Westfield, Mass., assignor to himself, W. O. BELL, and S. TRYON. Application filed August 18, 1873.

The rubber tubing is attached to the door-frame by means of a small wire inserted through its length, which is confined in place by small staples first inserted within the tube, through slits made at intervals in the side thereof, and then driven into the door-frame, spanning the wire.

Claim.—The combination of the wire c and the rubber tubing a, both secured to the door or door-frame, substantially as described, and constituting an improved weather-guard, as set forth.

145,751.—Miter-Machine.—THOMAS POOLEY, Blackberry Station, Ill., assignor of one-half his right to NICHOLAS JOHNSON, same place. Application filed September 5, 1873.

The depth of cut is regulated by the set-screw J on the arm H, pressing upon the bar F.

Claim.—In a mitering-machine for saws, the arm H, provided with the screw J and with the slotted pendants I I, in combination with the slotted post E, arm F, and slotted pendant G, all arranged together substantially as and for the purposes specified.

145,752.—Connecting-Rod.—TREAT T. PROSSER, Chicago, Ill. Application filed July 21, 1873.

Claim.—A connecting-rod composed of the parallel independent stay-rods A A and independent boxes C C C' C', the several sections of which are separately adjustable on the rods, substantially as and for the purpose specified.

145,753.—Fan-Blower.—TREAT T. PROSSER, Chicago, Ill. Application filed July 21, 1873.

The revolving cylinder has on each end spiral blades, which meet in the center, forming a chamber, into which the oppositely-moving currents of air are forced, and from which the air passes to the delivery-pipe. The case is open at the ends, and is enlarged at the middle. It is held in position by rings, which screw onto the ends of the case, and which are provided with arms, meeting in the hub through which the shaft passes. The lower arms also form a base, on which the blower rests.

Claim.—1. A revolving cylinder for fan-blowers, having upon its periphery and at each of its ends spiral blades or screw-threads, which meet and are joined at or near its center, thus forming chambers, into which the oppositely-moving currents of air are forced, and from which it is expelled by the joint action of the two blades or threads, substantially as set forth.

2. The case A of a fan-blower, having open ends for the admission of air, an interior diameter at its ends equal to the diameter of the cylinder, which revolves within it, and an enlargement at its center, for the purpose of forming an air-chamber, substantially as set forth.

3. The end supports, consisting of a ring, B, for the reception of the ends of the cylinder, arms B^1 B^1 B^1, and a hub for the reception of the shaft, one of said arms forming the base upon which the machine rests, substantially as set forth.

4. The combination of the double-bladed cylinder C, the open-ended case A, and the end rings B, substantially as and for the purpose set forth.

145,754.—Pegging-Machine for Boots and Shoes.—TREAT T. PROSSER, Chicago, Ill. Application filed July 21, 1873.

Claim.—1. In a machine for pegging boots or shoes, a driver, H, which first, by an oblique cut, heads and shears a nail from a length of wire, and then drives the headed nail thus cut into the boot or shoe, substantially as specified.

2. In a machine for pegging boots or shoes, a driver, H, which first cuts a nail from a length of wire, and then, simultaneously with driving such nail, delivers a blow upon the end of the wire to point it, in manner substantially as shown.

3. The driver H, having a beveled surface, A, in combination with the beveled end f of the nail-tube, substantially as and for the purpose specified.

4. The combination of the driver H, having the beveled surface A, nail-tube F having the beveled end f, and intermittently-rotating feed-wheels D and E, substantially as specified.

5. The combined nail cutter and driver H, in combination with a spring which, while in a compressed state, forces the driver through the wire, and, by its subsequent recoil, sends the driver to deliver the blow, driving the nail into the boot or shoe.

6. The combination of the combined nail cutter and driver H, rocking beam G, eccentric and rod I^2 I, and spring I^4, substantially as specified.

7. The combination of the vertically-adjustable combined nail cutter and driver H, rocking beam G, sleeve I^1, eccentric and rod I^2 I, spring I^4, and nut I^3, substantially as specified.

8. The combination of the combined nail-cutter and driver H, rocking beam G, eccentric and rod I^2 I, and shaft K, driven by a treadle through flexible pitman N, and carring fly-wheels M, substantially as and for the purpose specified.

9. The pitman N, composed of a flexible strap and metallic yokes n n, in combination with the crank-pin m and treadle O, substantially as specified.

10. The combination of the wabbling rotatory disk R and counter-weight S, substantially as and for the purpose specified.

11. A boot or shoe carrier, composed of the parts P P^1 P^2 P^3, substantially as specified.

12. The combination of the toothed wabbling rotatory disk R r, and the toothed carrier P p P^1 P^2 P^3, substantially as and for the purpose specified.

145,755.—Nail-Delivering Machine.—SILAS S. PUTNAM, Boston, Mass. Application filed October 29, 1873.

The intermittently-revolving carrier-wheel D is provided with two or more radial openings or compartments to receive the nails fed in through the conveyer E, an encircling ring or guard, B, preventing the nails falling out until they reach the opening 6 in the ring, where they drop down through the conductor G. The nails are turned completely over.

Claim.—The combination of the carrier-wheel D, having one or more compartments for the reception of the nails, with the ring B, having the apertures 6 and 8, the conductors E and G, and suitable mechanism for operating the said wheel, substantially as and for the purpose set forth.

145,756.—Earth-Closet.—ISAAC S. RUSSELL, New Market, Md., and HENRY R. RUSSELL, Woodbury, N. J. Application filed October 28, 1873.

The receptacle may be inverted for the discharge of its contents by a pull connected to a rack and pinion, and, by a lever detachably secured to the seat-lid, may be brought under the earth-reservoir for deodorizing its contents, either by the action of the lid or while the seat is occupied. The slides have agitators and scatterers, the upper slide being supported above the dispenser to avoid clogging.

Claim.—1. In combination with receptacle W, arm M, table T, and connecting mechanism, substantially as described, the lever S, arranged to be detached from the seat-lid L, as and for the purpose set forth.

2. The slide t, constructed as described, in combination with the dispenser g and slide s, for the purpose set forth.

3. The projections or agitators on upper slide s, and bars or scatterers on lower slide t, for the purposes set forth.

4. The combination of the arm M, pinion 5, rack 4, levers 3 and 2, and pull-up 1, for inverting the receptacle.

5. The projections 12 and 13 on the dispenser G, or their equivalents, for supporting the slide s above the dispenser, in order that small hard particles will not be caught between the edge of the slide s and dispenser g, as described.

145,757.—Game Apparatus.—JAMES N. SAWKINS, Langport, England. Application filed December 13, 1873.

Upon differently-colored stripes drawn lengthwise of a game-counter resembling a cribbage-board counts of dice-throwing are reckoned. The players count upon any stripe, and are confined to a particular stripe for only single counts, each being ignorant of the others' color, which is not discovered until the 120 points upon two stripes have been scored.

Claim.—1. The game apparatus herein described, consisting of the ball-box A B and balls, the table D and dice, all combined and arranged to operate substantially as specified.

2 The ball-box A B and balls a b, adapted for each other, substantially as and for the purpose described.

145,758.—Inhaling Apparatus.—EDWIN SCHOFIELD, Worcester, Mass. Application filed October 27, 1873.

The inlet-tube has a dome-shaped acid-chamber outside of the main receptacle. The mouth-piece has a valve placed in its interior during the process of blowing the glass. A flanged stopper furnishes a soft resting-place for the lower edge of the acid-chamber.

Claim.—1. The inlet-tube B for inhalers, when constructed with the pear-shaped expansion or domed chamber B^1, and annular acid-basin B^2, located above the stopper D, substantially as shown and described.

2. The combination with the draft-tube C in an inhaler, of the mouth-piece E, consisting of a bulbed glass tube, having valve-puppet E^1 confined within the bulb, as shown and described.

3. The combination, with the main receptacle A, of the inlet-tube B, having a pear-shaped expansion, B^1, and annular acid-basin, B^2, the flanged stopper D d, draft-tube C c, said parts being constructed of the peculiar forms shown, and arranged in relation to each other as set forth, for the purpose stated.

145,759.—Feather-Renovator.—JOHN E. SCHOOLER, Chillicothe, Mo., assignor of one-half his right to JAMES S. WEAVER, same place. Application filed November 6, 1873.

The feathers are washed by water, which enters through the conduit placed near the steam-chest and flows out through the condenser. They are afterward dried by heat from the steam-chest, being stirred by the revolving mixer during both operations.

Claim.—The drum A, provided with the steam-chest E, condenser or pipe L, and conduit F, the latter placed near to and warmed by the steam-chest, and connected with the drum by apertures, the water flowing through which passes over and is warmed by the surface of the drum heated by the steam-chest, whereby a constant stream of clean water is fed to the drum, substantially as shown, and for the purpose described.

145,760.—Ventilator for Railroad-Cars.—JASON D. SIMMONS, Quincy, Ill. Application filed December 12, 1873.

The deflecting-wings are provided with outwardly-turned flanges for diverting the direction of the dust-currents, and with inwardly-turned lugs for preventing the wings from closing against the window, and to which the connecting-rod is attached.

Claim.—1. The wings B, having the flanges E' turned on their outer edges, substantially as and for the purpose specified.

2. The wings B, having the inwardly-turned lugs E and outwardly-turned flanges E', and connected by means of the rod C substantially as shown and described.

145,761.—Fire-Proof Safe.—FRITZ A. R. SONTAG and WILLIAM H. LOTZ, Chicago, Ill. Application filed August 1, 1873.

A follower or sliding plate is placed within the compartment of a safe, where books and papers are placed, and is crowded by means of a screw against the papers, forcing them compactly together so as to lessen the possibility of combustion.

Claim.—1. A follower or sliding plate, B, within the book-space of a safe for crowding the papers together, in combination with any suitable device for actuating the follower, substantially as described.

2. In combination with a safe, A, and follower B, the hand-wheel C and screw D, substantially as and for the purposes set forth.

145,762.—Manufacturing Rubber Diaphragms for Water-Meters.—D. BRAINERD SPOONER, Syracuse, N. Y. Application filed January 18, 1873.

Treating vulcanized sheet rubber, &c., which has been temporarily held in a desired shape or position by any suitable means with heat of such temperature as will cause it to permanently assume the shape which has been given to it.

Claim.—1. The described method of treating vulcanized sheet rubber or vulcanized gum, consisting in holding the sheet in a desired position to give it the requisite form by means of a mold or formers, as described, and subjecting the same to proper heat, as and for the purpose set forth.

2. The diaphragm formed of vulcanized sheet rubber, substantially as described, as a new article of manufacture.

145,763.—Loom-Shuttle Guard.—EDGAR M. STEVENS, Boston, Mass. Application filed August 5, 1873.

The guard-rod is hung from supporting-arms on the top bar of the lay, and stops on the ends of the arms hold the rod against any lateral movement of the shuttle in its passage over the race. To move the guard-rod out of the way, when it is necessary to have access to the shuttle-race or the warp-threads, it is arranged to swing inward against the top bar, and is held in that position by a catch-arm hinged to a bracket or arm on the top bar and actuated by a spring-bolt. The back movement of the lay throws the guard-rod from its inner to its outer and working position.

Claim.—1. In shuttle-guards, the combination and arrangement of the lay top bar A and its projections B B with their end stops D D and the guard-rod, with one or more intermediate supports to the rod, when the guard-rod motion is at right angles to the lay-bar, all when constructed and arranged substantially as described.

2. The combination and arrangement of the swinging guard-rod C, the arms B B, the catch-arm H, and the arm E, placed on the lay top bar, and provided with the spring-bolt F, all arranged and fitted to operate substantially as set forth.

3. In shuttle-guards, the combination and arrangement of the lay top bar A, the arms B B, and the automatically-swinging guard-rod C, when the latter swings below the arms, with the catch-arm H and its immediate attachments, all substantially as shown and described.

145,764.—Balanced Valve for Steam-Engines.—NATHAN P. STEVENS, Hopkinton, N. H. Application filed November 26, 1873.

By means of the ports running through and across the valve it is balanced by exhaust and live steam.

Claim.—The cylindrical valve made in two semi-cylinders, a b, jointed and packed, and having passages h p p' through and across them, as described, in combination with the valve-case, having the arcal overlaps g g and the steam-passages d e d' arranged within it, in manner substantially as specified, all being essentially as represented.

145,765.—Windmill-Regulator.—DANIEL C. STOVER, Freeport, Ill. Application filed August 13, 1873.

At the side of the pump-stock, and communicating with it, is a surplus-water cylinder, fitted with a piston, the rod of which is connected to the weighted arm of the pivoted tail-vane. When the speed of the wheel becomes so great that more water is raised than the pump-nozzle can discharge the pressure of the water in the surplus-chamber depresses the piston therein and causes the wheel to be thrown out of the wind.

Claim.—A surplus-water cylinder, N, communicating with the interior of a pump, and having a piston working in it which is connected to a vane-working mechanism, substantially as described.

145,766.—Machine for Shaping Pickets.—ANDREW J. SUTHERLAND, Ann Arbor, Mich. Application filed August 8, 1873.

Pickets can be pointed in various forms by an adjustment of the cutters upon the moving parts.

Claim.—1. A picket-shaping machine provided with adjusting devices I I', holes 1, 2, &c., arms 1, 2, &c., cutters N N', bolts V V', and holes 1, 2, &c., in the block G, whereby the shaving-knives may be made to vary their style of approach while the picket is steadily moved between them, substantially as and for the purpose set forth.

2. In a picket-shaper, the knives W, provided with the protecters *u u'*, substantially as and for the purpose set forth.

3. The pivoted cutters N N', in combination with the cross-pieces G F, connecting-bars 2, moving cross-piece O, head-block bar C, head-block H, and lever L, substantially as and for the purposes shown and described.

4. In a picket-shaper, the combination of the head-block H, lever L, and the spring-fulcrum M M', substantially as shown and described.

5. The combination of the lever L, spring-fulcrum M M', head-block H, bar C, cross-piece O, connections 2, and pivoted cutters N N' with a suitable frame or bed, substantially as and for the purpose set forth.

145,767.—Wash-Boiler.—JOSEPH C. TILTON, Pittsburg, Pa. Application filed October 24, 1873.

Claim.—The false bottom B, having the tubes F F', secured to the boiler by the angle-bolts G G', as and for the purpose described.

145,768.—Hydrant.—THEOPHILUS VAN KANNEL and GEORGE ELZENHOEFER, Cincinnati, Ohio; said VAN KANNEL assignor to said ELZENHOEFER. Application filed September 17, 1873.

An elastic collar is placed between a collar on the valve-rod and the lower section of the hydrant. When the valve is closed the collar springs out, owing to its peculiar shape, and leaves a space for the escape of the waste water.

Claim.—1. In combination, the fixed member A, moving member C, and elastic collar E, to constitute a frictionless valve, substantially in the manner set forth.

2. The valve and its seat, and the elastic collar E, combined with the moving member C, provided with the waste-hole c^6, substantially as set forth.

145,769.—Caster.—GEORGE W. WAITT, Philadelphia, Pa. Application filed April 28, 1873.

The grooved head of a caster is provided with a cone and conical cap. Within this cone is fitted a slotted web, in which are conical friction-rollers, held at an inclined angle and having an orbital, and at the same time a motion of revolution on their axes.

Claim.—The grooved head A, provided with the cone D and conical cap I, in combination with the slotted web G and inclined conical rollers H, as and for the purpose set forth.

145,770.—Whalebone-Splitting Machine.—DANIEL WARNER, Boston, Mass., assignor to JAMES A. SEVEY, same place. Application filed November 26, 1873.

Irregular pieces of whalebone are split into three slips, one being of parallel sides, the others tapering.

Claim.—The two plane-stocks E E', cutters C C', springs or throat-pieces M M', and the guide-tongue R, arranged in manner and fixed upon a base or bed, B, so as to operate as and for the purpose substantially as described.

145,771.—Ore-Washer.—SETH WHEELER, Albany, N. Y. Application filed November 4, 1873.

The semi-cylindrical segment of one plate fits within that of the next plate, the segments being concentric with the hinge-pin or shaft uniting the plates. This form of joint prevents the loss of fine ore or the wedging of stones between the slats.

Claim.—An endless chain or carrier made of metal plates *a*, provided with segments *b c*, flanges *f*, and lugs *d d*, and connected by the hinge pins or shafts *e e*, substantially as and for the purposes set forth.

145,772.—Guard for Doors and Windows.—JOSEPH W. WHITE, Weymouth, Mass. Application filed November 28, 1873.

A guard for doors, formed of lattice-bars pivoted together so as to be extensible, and expanded into place and held there by means of a screw-threaded rod, a collar, and a nut.

Claim.—The lattice guard for doors, made as described, of the crossing and jointed bars *a b*, and arranged to be expanded and held to the door-frame by means of the screw-threaded rod *k l*, collar *i*, and nut *h*, as shown and described.

145,773.—Window-Guard.—JOSEPH W. WHITE, Weymouth, Mass. Application filed June 18, 1873.

In window-guards formed by a series of lattice bars pivoted to each other in the form of a "lazy-tongs," the guard is expanded against the sides of the frame, and held in position by the weight of the window resting upon the upper ends of the bars.

Claim.—The lattice guard for windows, made as described, of the crossing and jointed bars *a b*, and arranged to be applied to the window-frame and expanded and held by the weight of the sash, as shown and described.

145,774.—Carbonic-Acid-Gas Generator.—OTTO ZWIETUSCH, Milwaukee, Wis. Application filed August 19, 1873.

The machine is self-regulating, so that when the pressure of gas is too great the basket containing the marble chips is raised out of the dilute acid and the generation of gas stopped, to be resumed again when the pressure sufficiently ceases.

Claim.—1. Generator B, in combination with basket *f*, piston *c*, packing *o o*, packing *z z*, cover E, clevis *h*, cross-bar *u* and levers *s s*, weights *t t*, and connections *v v*, substantially as described.

2. Cross-bar *e*, cover *d*, and generator B, all in combination with latch *g*, substantially as described.

3. The combination of safety-valve *m*, washer D, and generator B, substantially as set forth.

145,775.—Hydraulic Feed for Revolving Rock-Drills.—ROBERT ALLISON, Port Carbon, Pa. Application filed December 10, 1873.

It consists in the combination of hydraulic cylinders, supply and discharge pipes, with a revolving drill-spindle carrying the drill-rod, and arranged externally to said cylinders, and so connected with their piston-rods as to be moved forward or back by pressure on the pistons.

Claim.—1. The combination, substantially as described, of the cylinders, pistons, and piston-rods with a spindle located outside of said cylinders, which carries the drill-rod, and is connected to said piston-rods, so as to be advanced or withdrawn by hydraulic pressure on the pistons.

2. The combination, with the cylinders A A and pipes O, N, J, and Q, of the four-way cock K, by which the feed of the drill is regulated or reversed, substantially as above described.

145,776.—Shoe-Fastening.—SAMUEL BABBITT, Brazil, Ind., assignor to himself and WILLIAM E. SIBLEY, Boston, Mass. Application filed November 1, 1873.

Claim.—A shoe-lacing consisting of the metal loops C, flat strap D, and buckle E, all combined and arranged substantially as described, and represented in the drawing.

145,777.—Till-Alarm.—JOHN F. BALDWIN, Nashua, N. H., assignor to himself and MILES ALARM-TILL MANUFACTURING COMPANY, Providence, R. I. Application filed November 1, 1873.

An alarm-till lock has vertically-moving bolts inclined on their lower sides, and resting upon similarly-inclined tops of peculiarly-shaped keys, which pivot upon a flange projecting from the base-plate.

Claim.—The combination, in a till-alarm clock, of the straight bolt E, extended bar, trip J on top of drawer, and one-armed lever F, substantially as and for the purpose described.

145,778.—Pen-Wiper.—HUGH S. BALL, Spartanburg, S. C. Application filed June 21, 1873.

To a vertical shaft are pivoted two curved levers, having sponge-cups at one end and weights at the other, to separate the cups to receive the pen, by pressure of which upon the lower sponge the upper one is caused to descend.

Claim.—In combination with a stand or support, B, the levers C D, provided at one end with sponge-holding cups F F', and respectively curved and weighted at their opposite ends, as shown and described, to operate as specified.

145,779.—Apparatus for Unloading Corn from Wagons.—THOMAS BARRON, Black Oak, Mo. Application filed September 13, 1873.

The bottom of the wagon is hinged to the side, which is arranged to be elevated and dump the load into a hinged conveyer.

Claim.—1. The buttons E, having toes at the outer ends, combined with a series of forked levers, G, connected by pivoted bars H, as and for the purpose specified.

2. The board T, provided with end plates U, pivoted to the frame, and combined with bottom c^1, as and for the purpose described.

145,780.—Grain-Car Unloader.—MASON W. BOSWORTH, Binghamton, N. Y. Application filed November 8, 1873.

A slotted plate moving on guides is reciprocated by an endless chain, a gudgeon, secured to the edge of the same, entering a vertical slot in the movable plate. To this plate one end of a rod is secured, the other end of which is held firmly between guide-pulleys. To either end of the rod scrapers are attached by cords. As the rod is reciprocated the scrapers will be alternately drawn to the door of the car.

Claim.—1. In a grain-car unloader, the combination of the drums B D, endless chain C, and gudgeon F, with the slotted sliding plate G and guide-rods H, substantially as and for the purpose described.

2. The slotted sliding plate G and guide-rods H in combination with the rod J and pulleys K, substantially as shown and described.

3. The rod J, arranged to be reciprocated, as shown, in combination with the ropes M, scrapers L, and guide-rollers N, substantially as shown and described.

145,781.—Railway-Crossing.—JAMES BRAHN, Jersey City, N. J. Application filed June 7, 1873.

Claim.—The slotted or hollow metallic blocks C, filled with wood D, provided with a wooden facing-block, E, and with a metallic guard-bar, F, in combination with the intersecting rails of a railroad-crossing, substantially as herein shown and described.

145,782.—Wind-Wheel.—PHILIPP BRAND, JOSIAH BARROWS, and ALEXANDER ARMSTRONG, Jacksonville, Ill. Application filed September 27, 1873.

The wheel is mounted on a tubular support so as to turn on a hollow shaft, and having a horizontal arm, with a friction-roller on it, working in a spiral slot formed in an arm of the vane-support, so that the wheel may swing around parallel with the vane out of the wind, when it is too strong.

Claim.—1. In combination with the vane and its casting or ring-socket F, provided with the spiral bar J having slot K, the wheel P, having an arm, M, working in said slot, and supported on a hub, O, revolving independently of the vane, substantially as shown and described, whereby the wheel may vary its position relatively to the vane.

2. In combination with the pump-rod, the lever T, having a swivel-connection therewith, and pivoted, at U, to an arm of the revolving hub O, carrying the wheel P, as shown and described.

145,783.—Wheel for Vehicles.—DAVID BROWN, Clinton, Tex. Application filed September 6, 1873.

Claim.—The cylinder C and flanges D, having polygonal bearing-surfaces, and the grooved and flanged ring E, in combination with the polygonal axle-arm, as shown and described.

145,784.—Furnace for Heating Soldering-Irons.—JOSIAH BURGESS, Zanesville, Ohio. Application filed June 19, 1873.

Claim.—1. The combination in a furnace for heating soldering-irons, substantially as described, of the chamber *a*, having compartments or chambers *c f*, tubes *i* and *o*, with chamber 2 and tube 3.

2. The combination in a furnace for heating soldering-irons, substantially as set forth, of the air-chamber *l*, provided with inlet-pipe 6 for attaching a hose, and the tube *o*, with the chamber 2 and tube 3, all arranged and operating for the purpose of using a blast.

145,785.—Curtain-Fixture.—HARVEY H. BURRITT, Belleville, N. J. Application filed October 25, 1873.

Claim.—The curtain-fixture made with a roller end, and a frictional clamp interposed between the inner surface of the roller end and the cylindrical or smooth spindle, substantially as set forth.

145,786.—Grinding-Mill.—DAVID A. CALDWELL, Jacksonville, Ill. Application filed February 15, 1873.

Devices as arranged for adjusting the runner-spindle vertically, and simultaneously indicating the degree of adjustment. Toothless driving-wheel and its connection, with a supplementary driving-gear, the former having springs arranged in suitable sockets to prevent back-lash, &c.

Claim.—1. The crank-arm and pointer moving over a dial, *x*, the screw *g* having collar *x'* for preventing endwise motion, the frame *u v* and movable bar *r*, and the lever *n* having a forked end and supporting the runner-spindle, all combined and arranged as shown and described, to operate as specified.

2. The combination, with the gear-wheel C, loose on the shaft B, of the fast wheel A having a slotted peripheral flange with sockets D, the springs F G, and cap-plates, all as shown and described, whereby the wheel A fits within and under wheel C, and is attached thereto, as specified.

145,787.—Billiard-Table.—HUGH W. COLLENDER, New York, N. Y. Application filed January 16, 1872.

An improvement over the French ogee tables, the underslanting side and end rails being in planes instead of curves, and cut under far enough to always clear the player.

Claim.—A billiard-table formed with beveled side rails *f*, or with the sides of its body beveled under, substantially in the manner and for the purposes hereinbefore specified.

145,788.—Bracelet-Fastening.—SHUBAEL COTTLE, New York, N. Y. Application filed November 1, 1873.

Claim.—The combination of the catch B, having the knob, the hinged cap C, fitting over said knob, and the spring-pin that locks the cap to the knob, all constructed substantially as described, and for the purpose set forth.

145,789.—Valve.—GEORGE R. CRANE, Painesville, Ohio. Application filed October 4, 1873.

Claim.—The bars composing the cage, having a stud to keep the valve in place, and being detachably connected to the plate A to allow of removing the valve by removing one of said bars, substantially as specified.

145,790.—Locomotive-Window.—JOHN H. DINSMORE, Boston, Mass. Application filed November 22, 1873.

Claim.—The improvement in locomotive windows and doors, consisting of an outer and inner sash, which form an inclosed space, with a system of steam-pipes running in the same along its sides, and hinged to the steam entrance and exit pipes, in the manner and for the purposes substantially as described.

145,791.—Fly-Trap.—GEORGE W. EICHHOLTZ, New Berlin, Ill. Application filed August 4, 1873.

Claim.—The vertical sheet-metal body B, removably connected with the slotted base plate A by pivoted hooks *a*, and having the wire gauze entrance-cones D, inner wire-gauze cone C F, and removable wire-gauze cover G connected therewith, all combined as shown and described, for the purpose specified.

145,792.—Dust-Pan.—ORLANDO C. FORSYTH, Jr., Newburg, N. Y. Application filed July 5, 1873.

A front stiffening-strip and a handle of wire bent to form a loop at top, twisted in the middle, its ends bent laterally in opposite directions and then downward, terminating in pads, the rear of the pan being thus slightly elevated.

Claim.—A dust-pan provided with a handle, C, made of wire bent at the middle to form an oblong end loop, next twisted together, then bent laterally and downwardly to support the rear of the pan, in the manner described.

145,793.—Piano and Organ Attachment.—LÉON J. FRÉMAUX, New Orleans, La. Application filed July 26, 1873.

The attachment being securely fastened above the key-board, a sliding tune-board having projecting pins is placed upon the attachment, and, turning the crank-handle, then slides the tune-board along, which operates a set of levers terminating in downthrusting pins, thus rendering the tune by simply turning the crank. Every tune requires a different slider.

Claim.—1. The combination of the adjustable bearers Y, adjusting-bar Z, elbow-levers Z^1, and the adjusting-screw Z^2 with the box of the playing attachment, substantially as specified.

2. The combination of said adjustable bearers Y, adjusting-bars V, and the clamps *a b* with the box of the said playing attachment, substantially as specified.

3. The combination of the socket-knobs *d* with the hammers and the box-bottom, substantially as specified.

4. The combination of a movable music-board, containing pins and bridges, as described, with levers I, for communicating motion to the key-hammers of an attachment for playing pianos, substantially as specified.

5. The arrangement of rods J^1, arms J^2, rock-levers K', arms L', and springs P with the key-hammers and the transmitting-levers I, substantially as specified.

6. A mechanical attachment for playing pianos and organs, comprising the detachable box, movable music-board, mechanism for moving said board, the hammers or plungers, and the levers, rods, rock-shafts, arms, and springs, combined and arranged substantially as specified in the foregoing clauses of claim, and for the purpose set forth.

145,794.—Nipper for Twisting Wire.—JOHN W. FAY, Panama, United States of Colombia. Application filed May 24, 1873.

The rivet or fulcrum is provided with an enlarged grooved extension.

Claim.—The boss B, formed on the extension of the rivet that connects the jaws together, in combination with the jaws *b b*, having the hole A, substantially as and for the purpose specified.

145,795.—Grain-Drill.—JESSE P. FULGHUM, Dublin, Ind., assignor to himself and WAYNE AGRICULTURAL COMPANY, same place. Application filed August 22, 1873.

The capacity of the feed-chamber, as well as that of the feed-wheel, is governed by the adjustment of one end of the chamber and a revolving disk, which is fitted to and slides upon the feed-wheel. The shaft and disk, and the adjustable section, are moved by a forked lever, which engages with a collar upon the shaft, the lever being adjustable at any point by a lateral slot and thumb-screw.

Claim.—1. The box composed of the castings B C, having the shoulder V formed therein, the loose feed-wheel F, supported within the box, the non-circular driving-shaft H, adapted to slide axially, and the cut-off disk J and guard-plate M, attached to the driving-shaft and sliding therewith, all constructed and combined substantially as herein described, for the purpose specified.

2. In combination with the shiftable and rotating driving-shaft H, with its attached cut-off disk J, the lever R *r*, bracket S *s*, stud and thumb-nut T *t*, and pivot Q, for the object designated.

145,796.—Scrubbing-Machine.—WILLIAM J. GARD, Winona, Minn. Application filed October 17, 1873.

A cylinder containing water or suds is supported by posts on casters; descending through it, with brushes at the bottom and a pinion at the top, is a shaft revolving in alternate directions by a segmental rack and hand-lever. An elastic apron in vertical guides prevents splashing. Water is supplied to the brushes by a tube and piston in the cistern, having a spout descending below it.

Claim.—1. In a scrubbing-machine, the water-conducting pipe E, having an opening, *i*, stop *h*, the handle *g*, in combination with the water-tank D, brushes B, shaft *a*, pinion *b*, and segmental rack *c*, all operating substantially as described.

2. The curved scraper G, having on its lower edge the rubber strip *m*, in combination with the grooves *k k* and the lever *n*, for elevating and depressing the scraper, substantially as described, for the purpose set forth.

145,797.—Blind-Hinge.—OLIVER S. GARRETSON, Buffalo, N. Y. Application filed February 7, 1873.

A small spur is cast upon one leaf and a slight indentation in the other, and these are for the purpose of assisting the builder in properly setting the hinge.

Claim.—A blind-hinge having the spur or marker *f* on one half, in combination with the indent *h*, or other equivalent mark, on the other half, substantially as and for the purpose herein set forth.

145,798.—Toy Pistol or Gun.—GLOVER S. HASTINGS, Plainville, Conn., assignor of two-thirds his right to CHARLES R. STEPHENS and EDWARD N. PIERCE, same place. Application filed September 25, 1873.

Claim.—1. A toy pistol, for firing off parlor or other detonating matches, provided with a hammer and trigger, constructed in one piece, and operated by simple lever-pressure, substantially as set forth.

2. The combination of the barrel and stock, constructed in one piece, with a hammer and trigger, similarly constructed, substantially as described.

3. The hammer and trigger B D, made in one piece, and weighted below the pivot so as to be self-cocking, substantially as shown and described.

4. The mode herein described of impelling the stock of a match or arrow, to one end of which detonating-powder is secured, by subjecting the powder to pressure or concussion within the barrel of a fire-arm, adapted to hold the match at any angle, as it is subjected to pressure, and guide the stock as it is impelled from the barrel, substantially as shown and described.

5. The barrel A, provided with the projection A and inclined recesses *i*, in combination with the hammer D, substantially as set forth.

145,799.—Washing-Machine.—MOSES L. HAWKS, Kinderhook, Mich. Application filed September 20, 1873.

In a washing-machine having upper and lower corrugated rollers journaled in a suitable frame are connecting wires or rods, bent twice at right angles, connecting the standards and cross-bars. Rubber bands, whole in their upper section and split in their lower part, act as springs on the bearings of the upper roller.

Claim.—1. The connecting wires or rods P, bent twice at right angles at the inner sides of the standards D, combined with said standards, and with the cross-bars M M, substantially as herein shown and described, and for the purpose set forth.

2. The rubber bands L, whole in their upper part, and split in their lower part, and the stationary supports N, in combination with the half-bearings K of the upper roller A, and the supports O, attached to the cross-bars M, that form the bearings for the two outer lower rollers C, substantially as herein shown and described.

145,800.—Printer's Furniture.—HENRY A. HEMPEL, St. Joseph, Mo. Application filed August 27, 1873.

The key being inserted between the rack-bars, the quoins are moved up or down the incline, and thus lock or unlock the type. The peculiarity of this device with double incline is that when the pressure on one quoin is greater than on the other the movement of the one which encounters the less pressure will be accelerated, while that of the other will be retarded until the pressure is equalized—*i. e.*, until both quoins bear equally against the type.

Claim.—The combination of the quoins *m* and *m*, provided with rack-bars *a a*, the pinion *g*, and double-inclined frame or bar *e f*, substantially as shown and described, to operate as specified.

145,801.—Gaiter-Boot.—CALVIN HERSOME, Boston, Mass. Application filed November 19, 1873.

Claim.—The loop E, in combination with the fastening-strap C of a gaiter-boot, all substantially as and for the purpose described.

145,802.—Construction of Cisterns.—LUTHER HOWE, Oshtemo, Mich. Application filed November 29, 1872.

Claim.—The herein-described method of constructing a cistern, namely, by forming a mold of earth, coating the same with water-cement, which is allowed to harden, excavating the mold, and completing the cistern by lining the lower portion of the excavation with water-cement joined to the edges of the upper portion, substantially as specified.

145,803.—Carpet.—GREGORY ISKIYAN, New York, N. Y. Application filed November 1, 1873.

The weft consists of stripe of felt, on which a long nap is raised and then pressed down upon the surface to hide the cotton or linen warp-threads.

Claim.—A fabric of which the weft is of woolen felt only, or the same and woolen yarn, and the warp of cotton twine or thread, or other cheap material, having a nap raised on the surface, and either pressed and matted down to hide the warp or not, substantially as specified.

145,804.—Molding-Machine.—NICHOLAS JENKINS, Madison, assignor to himself and FRANCIS O. MANCHESTER, New Haven, Conn. Application filed April 26, 1873.

A series of guide-plates are secured upon one side of the material to be operated upon, which is carried forward by suitable feed and guide rolls and presented in the desired position to the action of the forming-cutters.

Claim.—1. The wheels B^1 B^2 C' D', in combination with suitable cutters *t*, and arranged to operate, relatively thereto and to the material M, as herein set forth.

2. The feeding and guiding shafts B C D, with their respective wheels, in combination with suitable cutters *t*, and with the castings N, fixed upon the material M, all as and for the purposes herein specified.

145,805.—Ventilating Car-Window.—CHARLES B. KNEVALS, New York, N. Y. Application filed December 1, 1873.

A horseshoe-shaped plate provided with stop-flanges upon the ends of its arms, which are perforated, and in combination with the casing and sash of a car-window and the bolts attached to said sash, all adjusted to admit air to ventilate the car and exclude the cinders and dust.

Claim.—The horseshoe-shaped plate C, provided with stop-flanges upon the ends of its arms, in combination with the case and sash of a car-window, and with the bolts D, substantially as herein shown and set forth.

145,806.—Steam-Pump.—BENJAMIN S. LAWSON, New York, N. Y. Application filed October 27, 1873.

Claim.—1. The crank-shaft C, carried on the piston-rod, in combination with the crank *c* and connecting-rod *d*, the latter connecting to a pivot or shaft, D, mounted in fixed bearings, as herein specified.

2. The cross-piece D^1 D^2 on the rocking shaft D, which by a suitable connection, operates the valve *s*, in combination with the spring G carried on or by the piston-rod, as herein specified.

3. The valve-rod E and valve *e*, operated by the arm *d'* on the rocking lever D, in combination with the long arm or connecting-rod *d*, and cranked shaft C *c* carried on the piston-rod, and with spring G, also carried thereon, arranged to serve in throwing the crank past the center, as herein specified.

145,807.—Bung-Bush Inserter.—LOMAX LITTLEJOHN, New York, N. Y. Application filed September 27, 1873.

After the sleeve has been expanded sufficiently by the elliptical journal, a tongue formed thereon strikes the shoulder of the split sleeve, and thus prevents the bursting of the bush by further expansion.

Claim.—The combination, with an ellipsoidal shank, A, used to spread the two parts of a cut ring, of the tongue H, arranged as and for the purpose set forth.

145,808.—Pie-Marker.—THOMAS S. MACOMBER, Hamilton, N. Y. Application filed October 18, 1873.

A rotary concave trimmer is attached to a rotary marker, which has on its face a stamping design and air-hole cutters.

Claim.—In an implement for marking and trimming pies, possessing a cutter, A, and marking-wheel B, the combination therewith of the stamping-die *b* and vent-hole cutters *d*, as and for the purpose specified.

145,809.—Letter-Clip and Paper-Binder Combined.—GEORGE W. MCGILL, New York, N. Y. Application filed August 22, 1873.

A mortise in the lower jaw of the clip admits the thumb to raise the retaining-pin and release the paper-fasteners.

Claim.—A clip for holding or binding papers, one plate or leaf of which is provided with an opening through which to operate a paper fastener retaining-spring, D, substantially as and for the purpose specified.

145,810.—Apparatus for Manufacturing Illuminating-Gas.—JOHN G. MÜLLER and WILLIAM MÜLLER, Dayton, Ohio. Application filed October 4, 1873.

The valve and its inclosing gasometer, arranged over the retort and between it and the purifiers, performs the function of the hydraulic main usually employed. The retort is placed in a brick furnace provided with cast-iron front and rear plates bolted to the brick-work.

Claim.—1. The arrangement, between the gas generator and receiver, of the valve E, formed of an outer vessel having an annular portion containing liquid for sealing the movable top or cover, the valve *g g'*, and tar-escape pipe A, and gas inlet and exit pipes *f' f*, projecting up into the chamber of the valve, all as shown and described, to operate in the manner specified.

2. The improved gas apparatus, formed of reservoir D, retort A with funnel attachment *s s'*, and pipe *f*, valves E E', purifiers F, and receiver G, all constructed and arranged to operate as specified.

145,811.—Sofa, Chair, &c.—ADAM S. NEWHOUSE, Hamburg, S. C. Application filed July 10, 1873.

The seat and back of the chair or sofa are made of wood and provided with perforations, in which pegs are inserted that hold the strings attached to the tufts in place.

Claim.—A sofa or chair having a solid back or seat of woodwork, perforated as shown, and tufted by means of the pins or pegs C and strings *c*, substantially as described.

145,812.—Lubricating Compound.—JOHN B. NORRIS, Richmond, Va. Application filed August 14, 1873.

Claim.—A lubricating compound composed of the several ingredients herein specified, viz: Lubricating-oil, residuum, Spanish whiting, sal-soda, reduced cannel-coal, concentrated lye, tallow, and water, compounded in the proportions, and in the manner, and for the purposes substantially as herein set forth and described.

145,813.—Mechanism for Towing Boats.—GILES S. OLIN, Deer Lodge, Mont. Ter. Application filed September 27, 1873.

The main driving-shaft is detachably connected by gearing with the propeller shaft, and is also detachably connected with an additional shaft carrying a rope or chain drum. By this arrangement the propeller-shaft may be thrown into gear with the driving-shaft, to send the boat ahead, at the same time that the drum is allowed to unwind the rope or chain. The boat is then anchored by setting-poles, the propeller-shaft thrown out of gear, the drum-shaft thrown into gear, and the boats in tow are drawn to the tug, when the operation is repeated.

Claim.—The combination, in a canal-tug, of the detachably-coupled drive-shaft I and propeller-shaft J, with a shaft, D, and drum C, also detachably connected, as described, to allow the same power mechanism to wind up the rope, and thus tow the boat along at one time, while at another it pays out the rope by propelling forward the tug.

145,814.—Sewing-Machine.—CHARLES H. PALMER, New York, N. Y. Application filed October 14, 1873.

To sew straw-braid. The circular eye-pointed needle, the point of which enters and emerges from the same side of the material, is secured at the end of a horizontal rock-shaft operated through the walking-beam and flexible or cord connections. The finger and spreader catch, open, and retain each loop to be entered by the needle, to form a chain-stitch.

Claim.—1. The combination, substantially as set forth, of the circular needle described, the table, the feed, and the mechanism described for operating said needle.

2. The combination of the needle described, the loop-finger, the spreader, and the pendulum face-plate, arranged to operate substantially in the manner and for the purposes set forth.

145,815.—Rubber Mat for Pitchers, &c.—CORNELIUS A. PRICE, Jersey City, N. J. Application filed September 27, 1873.

Reticulated to a portion of its depth, its shape, in part, conforming to the bottom of the pitch, in front of which, in part of a larger concentric circle, stand the tumblers. A raised portion between the pitcher and tumblers prevents the forward sliding of the former.

Claim.—As an article of manufacture, a rubber mat for pitchers, &c., formed of the parts A and B, separated by a semicircular raised rib, C, as shown and described.

145,816.—Bleaching Damaged Cotton.—JAMES B. RICKARDS, "The Green," Kilburn, assignor to GEORGE FIPOOT LYDE, Manchester, England. Application filed November 12, 1873.

Claim.—1. The compound for permanganate of potassa, chloride of lime, and glycerine, substantially as and for the purpose set forth.

2. The compound of carbonate of potassa, chloride of lime, and glycerine, substantially as and for the purpose set forth.

3. The process of cleansing and bleaching vegetable fibers by means of the combination of permanganate of potassa, and chloride of lime, and of carbonate of potassa and chloride of lime, with or without the use of glycerine, as set forth.

145,817.—Lock or Catch for Trunks.—ANTONY V. ROMADKA, Milwaukee, Wis., assignor to ROMADKA BROTHERS, same place. Application filed August 29, 1873.

Claim.—In a trunk-fastening device, the lever or handle F, having the catch D, in combination with the catch C and spring E, constructed and operating substantially as and for the purpose set forth.

145,818.—Machine for Driving Nails.—ADDISON SMITH, Perrysburg, Ohio. Application filed March 3, 1873.

Claim.—The combination of the plate C, provided with its finger *b* and notched shoulder *a*, with the feeding device B, whereby they support alternately the column of tacks, and supply them singly to the opening below, substantially as and for the purpose described.

145,819.—Locomotive-Furnace.—ANDREW J. STEVENS, Sacramento, Cal. Application filed October 4, 1873.

Claim.—A boiler-door provided with a damper, F, on the outside, and an air-deflector, H, on the inside, as described, so that when the former is opened the latter deflects the whole current of air, and directs it into the fuel.

145,820.—Weather-Strip.—OLIVER A. VORCE, Kentland, Ind. Application filed November 8, 1873.

The strip is raised by means of a rod, which connects it to a crank near the center of the door, and the bell-crank is connected to a spindle-lever on the shaft of the door-knob. The turning of the door-knob operates the bell-crank and raises the strip from the door-sill. A strip-spring on the top of the door is connected to the bell-crank by a rod, and when the door is opened the spring is released, and holds the strip in an elevated position.

Claim.—1. The automatic weather-strip C, which is raised and lowered in the door A, in connection with the bell-crank lever D, double spindle-lever E, and top-spring F, in combination with the door-sill B, having projecting cap-piece *a*, substantially as and for the purpose described.

2. The combination, with the door and door-casing, of the spring F, cords or rods *f d*, and strip C, as shown and described.

145,821.—Curtain-Fixture.—HENRY K. WARNER and CHARLES E. SMITH, Rochester, Minn. Application filed March, 15, 1873.

The curtain-roller is suspended in a frame composed of a top and a back bar, a stationary and a pivoted bracket, and to the front of the top bar is pivoted or hinged a cornice to protect the curtain.

Claim.—1. The combination of the bars D E, stationary bracket H, and pivoted bracket I with each other, to adapt them to receive the shade-roller C, substantially as herein shown and described.

2. The combination of the hinged cornice L with the bars D E, stationary bracket H, and pivoted bracket I, substantially as herein shown and described, and for the purpose set forth.

145,822.—Machine for Removing Snow and Ice from Roadways.—CHARLES G. WATERBURY, New York, N. Y. Application filed March 22, 1873.

A blast of air entering near the top of the furnace drives the flames down through the bars against the surface of the roadway. The heat is confined by the sides of the furnace, which extend downward on three sides nearly to the ground.

Claim.—1. The combination, with sides D E, of cover M, having the depressions P, as and for the purpose set forth.

2. The inner and outer shells, A and K, of the furnace, forming the water-space J, extending down the sides D E, and closing the heat-channel in the rear of box Q, as and for the purpose specified.

3. The combination, with the sides D and E, forming the channel for confining the heat, of the hood G, substantially as and for the purpose specified.

145,823.—Sewing-Machine.—THEODORE A. WEBER, Philadelphia, Pa., assignor to ALBERT LATHROP RUNYON. Application filed August 30, 1873.

Improvement on patent No. 139,067. By arranging the parts to operate so that the looper first enters the loop of needle-thread, a very short rigid needle may be used, which is not the case when the hook first operates. The hook spreads the loop for the passage of the spool. The bulged plate of the looper holds the slack given up by the hook, and it with the take-up draws the stitches taut.

Claim.—1. The arrangement of the rotating looper, needle, and the vibrating spreader, substantially as described, so that the rotating looper takes the loop first and near the plate K, and then the spreader takes said loop from the looper, substantially as specified.

2. The upper take-up *b*, arranged in connection with the needle-arm W, and in combination with the lower bulged rotating take-up E F, substantially as specified.

145,824.—Till-Alarm.—EGBERT O. WOOD, Nashua, N. H. Application filed November 1, 1873.

The tumblers and keys of an alarm-till lock are strung in pairs, separated by the partitions of a slotted frame, upon a single bolt or wire. The contiguous parts of each pair are fitted to one another by shoulders and recesses, so as to admit of their proper working.

Claim.—The tumblers J and keys I, constructed substantially as herein shown and described, in combination with the bed F, bolt G, and lock-plate K, as and for the purposes set forth.

145,825.—Adjustable Hanger for Mirrors, &c.—JAMES WRIGHT, New York, N. Y. Application filed November 15, 1873.

Two tongued and grooved strips are combined together, the upper or front one having a hole in its upper end to receive the nail, and the lower one is provided with a shelf, on which the lower part of the mirror-frame rests. The two strips are held together by a screw-clamp, and are provided with a hand-hook to receive the suspending-cord.

Claim.—The combination of grooved and tongued strips A B, the former sliding upon the latter, and the latter having a shelf, G, with the clamp C D and hand-hook E F, as and for the purpose specified.

145,826.—Whiffletree.—HENRY AGAR, Batavia, N. Y. Application filed August 19, 1873.

Claim.—The hooks C, passed through the bar B, and secured to the springs D, so that their hooked ends will be held against the bar B and prevent the disengagement of the traces when the draft is slackened, as set forth.

145,827.—Apparatus for Bending Coffin-Sides.—JOSEPH P. ALBIN, Cincinnati, Ohio. Application filed November 6, 1873.

Inclined grooves *c* are provided on the inner face of the side lugs E, in which the locking-bar F is made to clamp the board.

Claim.—In a machine for bending coffin-sides, the lugs E, having inclined grooves *c*, in combination with the bar F, cleat C, groove *c*, and frame A A^1 A'', B and B', all constructed and arranged substantially as set forth.

145,828.—Molding Apparatus.—WILLIAM C. AMISH, Hainesport, N. J. Application filed November 24, 1873.

A reciprocating frame arranged in a box carries at either side a half-pattern, which projects through an aperture in the box. A flask is placed upon the box and rammed up. The pattern is then withdrawn and the flask removed. The box being reversed, the other part of the mold is formed in the same manner.

Claim.—1. A reversible molding apparatus in which the two halves of the pattern are arranged at opposite sides of a box, D, and admit of being advanced and retracted thereon, for the purpose specified.

2. The combination of the box D, the sections A and A^1 of the pattern, and the sliding frame B, whereby one of the said sections may be advanced through an opening in the box simultaneously with the retracting of the other section, for the purpose specified.

3. The combination of the bolt *i* and notched disk *j* with the cam-shaft G, for the purpose set forth.

145,829.—Child's Chair.—ROBERT ARDREY, Philadelphia, Pa. Application filed September 22, 1873.

The stool is provided with a pivoted foot-rest having a curved arm, which rests against the lower side of the seat when the rest is lowered for use. A padded ring is used in connection with the leaf having the circular opening therein.

Claim.—1. The combination, with the stool A, of the swiveled foot-rest E, provided with the curved arm or rest *e*, the end of which rests against the seat when the rest is lowered to retain the latter in a horizontal position, substantially as shown and described.

2. In combination with the leaf D, having the opening d^1, the padded ring d^2, for the purpose set forth.

145,830.—Tool.—JAMES H. BAKER, ASA DONEY, and FREDERICK N. OWEN, Saratoga Springs, N. Y. Application filed September 25, 1873.

A hammer, tack-puller, and spike-extractor are combined in one tool.

Claim.—As a new article of manufacture, the within-described tool or instrument, consisting of the handles A E, jaws B B, head C, lever D, claw F, and spring G, all of said parts being constructed and arranged to operate substantially as and for the purposes herein set forth.

145,831.—Loom-Shuttle.—EDWIN P. BALL, Chicopee, Mass. Application filed May 16, 1873.

The invention is intended to avoid the injurious effects of threading the eye of the shuttle by suction, the parts being so constructed that the thread can be driven through the eye by blowing through the tube arranged for this purpose.

Claim.—The combination and arrangement of the blowing-tube C with the shuttle-eye B, when the latter is made of larger diameter than the blowing-tube C, substantially as and for the purpose described.

145,832.—Ship's Hull.—EUGENE C. BÉLÉGUIC, Paris, France. Application filed August 4, 1873.

Claim.—A ship's hull, constructed with an extension-bow forward of the deck, and provided with narrow upward projections *s* on such extension, substantially as described.

145,833.—Rigging-Stopper.—THOMAS G. BELL, Brooklyn, N. Y., assignor to JOSEPH J. WALTON, New York city. Application filed April 22, 1873.

Short chains are provided at one end with a small bent ring-link, and at the other end with shackles. The ring is just large enough to allow the chain to pass freely through it, thus securing a bight on the shroud. The shackles are then attached and the tackle applied to obtain the requisite tension, when the chains are secured by a lanyard or other suitable lashing.

Claim.—The chains A, provided with the small ring-links B, bent to conform to the shape of the rope, the shackles affording means for attaching the ordinary tackle, and for securing the parts by the use of lanyard D, all constructed and arranged as and for the purpose specified.

145,834.—Car-Axle Lubricator.—JAMES E. BERING, Newburg, N. Y. Application filed August 13, 1873.

Claim.—1. The curved tube C, attached to the end of journal *a*, combined as and for the purpose described.

2. The bearing E, having one or more slopes, $e\ e^1\ e^2$, in combination with the disk D, in the manner and for the purpose described.

145,835.—Berth-Lock for Sleeping-Cars.—THOMAS A. BISSELL, Detroit, Mich. Application filed October 4, 1873.

Claim.—1. In a sleeping-car, a spring-latch attached to the partition to engage with the end of a hinged berth, in combination with releasing mechanism secured upon or within said berth, substantially as and for the purpose specified.

2. The means employed for releasing the spring-latch E from engagement with the end of the berth, consisting of the pivoted lever H, pin I, handle L *l*, and the wires A, constructed and combined to operate substantially as and for the purpose set forth.

3. The locking and releasing devices, consisting of the spring-latch E, attached to the partition, the pivoted lever H, bolt I, handle L *l*, and connecting-wires A and A, secured upon the berth, all constructed substantially as and for the purpose specified.

145,836.—Burglar-Alarm.—FRANCIS W. BLAKEMORE, Philadelphia, Pa. Application filed October 18, 1873.

A right-angled lever, pivoted to a door near its top, engages, when the door is opened, with an oblique flange projecting from a disk pivoted to the wall above and carrying the hammer of a bell. When the door is opened an alarm is sounded; when it is closed the parts resume their normal position, ready for another alarm.

Claim.—The drum D, provided with the gravity-hammer C and oblique plate E, in combination with the plate B, secured to the door-jamb, and holding the gong A and stud *b'*, and the bell-crank G, having the weighted arm *g* resting upon the stud g^1, said crank being attached to the door, all constructed and arranged as shown, and for the purpose specified.

145,837.—Tack-Puller.—CHARLES W. BLAKESLEE, Plantsville, Conn. Application filed September 16, 1873.

The fulcrum-bar is curved toward the handle. The handle is placed outside of the plane of the puller.

Claim.—As an article of manufacture, the herein-described tack-puller, consisting of the lever or handle A provided with a jaw, *a*, combined with a second jaw, *d*, pivoted to the first, and extended to form the fulcrum *c* and handle B, substantially as specified.

145,838.—Ice-Machine.—WILSON BRAY, Lambertville, N. J. Application filed October 22, 1873.

At one end of the apparatus is an ice-box, through which the air-pump can draw the supply of air to be condensed, and the drip-water from the ice-box is conducted into the outer box surrounding the expansion-coil to be utilized.

Claim.—1. An ice-producing apparatus in which are combined an air-pump, V, and two series of submerged pipes, K and E, each communicating directly with the said pump and with each other through a casing or passage in which is arranged a loaded valve, R, all substantially as and for the purpose specified.

2. The combination of the air-pump V and two connected series of submerged pipes, E and K, the former communicating with the pump, and the latter terminating in an outlet provided with a loaded valve, X, all substantially as and for the purposes specified.

3. The arrangement, substantially as described, within the outer tank or freezing-chamber A, and in respect to the central tank B, of the vessels F and G, and the coils E.

4. The combination, substantially as described, within the tank B, of the water-pans H, I, and J, and their connected coils K, K^1, and K^2.

5. The combination of the vessels L, M, N, and P with the coils K, K^1, and K^2, substantially as and for the purpose specified.

6. The combination, with the coils K^2 and E, of the vessels P and F, the valve R and its casing, and the pipe S, all substantially as specified.

7. The combination of the air-pump V, ice-box T, vessel G, and the pipes *s* and *q*, with their cocks, whereby communication may be established between the said pumps and either the ice box or vessel, all substantially as and for the purpose specified.

145,839.—Operating Car-Doors.—JOHN G. BRILL and GEORGE M. BRILL, Philadelphia, Pa. Application filed June 21, 1873.

Claim.—1. The series of crossed bars B B constituting lazy-tongs, in combination with the car-door A, to operate together in right-lined movements, the bars being jointed at one end to the door and connected at the other end to mechanism operated by the driver, as and for the purpose set forth.

2. The bar C, jointed to the door A and to the crossed bars B, substantially as and for the purpose set forth.

3. The foot-levers L L' and rods F H, in combination with the series of crossed bars B B and the door A, substantially as and for the purpose set forth.

145,840.—Process for Purifying and Bleaching Tallow, Lard, &c.—JOSEPH R. BROWN, New Haven, Conn., assignor of one-half his right to HENRY A. STEARNS, Lincoln, R. I. Application filed December 18, 1873.

Claim.—1. Purifying and bleaching tallow, lard, and other fatty matter, by subjecting the same in succession to the action of sulphuric acid, alum, and atmospheric air, substantially as and for the purpose herein set forth.

2. Bleaching and purifying tallow or lard by forcing atmospheric air through the same when heated, above 200°, but not above 230° Fahrenheit, as specified.

3. Bleaching and purifying tallow or lard by forcing through the same, when heated, air charged with the vapor of salt, as described.

145,841.—Quilting-Guide for Sewing-Machines.—FRANK G. BUSCHMEIER, Philadelphia, Pa. Application filed September 16, 1873.

The weighted lever-arm keeps the guiding-arm against the material being quilted, and when the presser is lifted the cam-piece strikes against the lower portion of the head or face plate and turns the guide arm up from the material.

Claim.—1. The arm C, rod D, and weighted lever F, combined and operating substantially as and for the purpose set forth.

2. The cam G, attached to the arm C, and operating to raise the latter when the presser-foot bar is elevated, substantially as set forth.

145,842.—Window-Blind-Slat Operator.—EBER C. BYAM, Fort Dodge, Iowa. Application filed September 30, 1873.

A link connects the rod at the sides of the slats with a pitman-crank which is operated by a pinion-wheel, and serves to hold the slats open at any required angle.

Claim.—The crank-pin *b* on the toothed wheel *a*, when combined and operated with the movable rod D by means of a link or pitman connection, *f*, and the adjustable fastening *g*, substantially as described, and for the purposes specified.

145,843.—Manufacture of Iron and Steel.—CALVIN CARPENTER, Jr., Seekonk, Mass. Application filed July 2, 1873.

The blast passes down through the molten metal in the smaller chamber, and thence up through the mass in the larger chamber, whereby the refining and converting processes are both carried on at the same time and by the same blast.

Claim.—1. A furnace having the chamber A for melting the metal, and the chamber B, connected thereto, as shown, with the blast-inlets arranged at the top of the latter, the whole being constructed substantially as described, whereby the metal can be both melted and treated in the molten condition by the compound blast, in the manner set forth.

2. The chemical hot-blast, consisting of the vapor of hydrocarbon oil, in which potash has been dissolved, combined with steam, and then superheated, for the purpose of acting as a fuel, and also acting chemically on the metal, as herein set forth.

3. The compound blast, consisting of the combined vapors of steam and hydrocarbon oil, and a blast of air reduced below the ordinary temperature, applied to molten metal, as described, for the purpose of rendering the product more magnetic, as set forth.

4. The flux consisting of lime, silica, clay, and potash, when prepared for use in a furnace, substantially as herein described.

145,844.—Fire-Escape.—LUCIEN M. CHIPLEY, St. Louis, Mo. Application filed November 25, 1873.

A fire-proof window-shutter jointed and folded so as to form, when extended, a fire-escape ladder. Each shutter when unfolded connects with the shutter below, so as to form a continuous ladder reaching to the ground. The lower folds are held in place by steps attached to the walls and catches upon the shutter. A fire-proof cord is connected with the catches, which hold the folds in place, so that they may be released from below and the ladder unfolded.

Claim.—1. The combination of a series of folding or sliding ladders attached to window-shutters placed one above the other, substantially as shown.

2. The combination of the fold D, staple G, and catch *g*, substantially as shown and described.

3. The combination of the folds D and D' and steps I, substantially as shown and described.

4. The combination of the cord H, rod E, and *c* of catch F, and fold D, substantially as shown and described.

5. The combination of the cord H, rod E, catch F with the staple G and fold D', substantially as shown and described.

6. The combination of the cord H, rod E, point *g* of the catch F, and staple G, substantially as shown and described.

7. The steps I, for the uses and purposes substantially as shown and described.

8. The steps L, for the uses and purposes substantially as shown and described.

145,845.—Hoop-Skirt.—WARD COE, New Haven, Conn. Application filed November 22, 1873.

The wires or hoops are run through the openings where the warp-threads of the tape are left unfilled.

Claim.—As a new article of manufacture, the herein-described hoop-skirt tape consisting of a single fabric having several of the warp-threads at certain points upon each edge unfilled, substantially as specified.

145,846.—Process of Preparing Grain for Manufacture into Flour.—OREN F. COOK, Grand Island, Cal. Application filed September 18, 1873.

The grain, after being softened by water or steam, passes into a hulling-machine so constructed that the bran will form as intervening substance between the metallic surfaces and the grain, the hulling process being the result of attrition of the grain itself between the partially-elastic surfaces formed from the bran, and, aided by the detached bran, incorporated with the grain.

Claim.—The process of removing from grain its outer husk or bran, as herein described, to wit, first subjecting the grain, after the ordinary cleaning, to the action of water or steam, to soften the husk, then passing it between two vertical bran-covered metallic surfaces, one revolving within the other, substantially as set forth.

145,847.—Bale-Tie.—FREDERIC COOK, New Orleans, La. Application filed October 25, 1873.

Claim.—A bale tie or fastening, composed of a hook or band piece, H, having a long solid riveting-strip, G, rolled upon it, by which it is riveted to a single or double thickness of the band, and a recess, K, to receive and retain the bent end of the band, which is slipped laterally over it, as described and represented.

145,848.—Cultivator.—ANDREW COOPER, Macomb, Ill., assignor of one-half his right to MARTHA E. UPDEGRAFF, same place. Application filed October 6, 1873.

Claim.—1. In a parallel cultivator, the frames A A carrying the wheel-spindles *n*, the draft attachment J, and the plow-beams C, all constructed and combined as shown, for the purpose set forth.

2. The combination of the frames A A; draft attachment J, and center-bar D, having arched arms, and connecting the frames by means of hinged joints *i*, substantially as shown and described, and for the purpose specified.

145,849.—Cotton-Chopper.—JOHN COSTON, Bowdon, Ga. Application filed July 17, 1873.

The pinion-wheel carries a crank-shaft to which is attached the hinged frame of the choppers, and by which their movement after each stroke is made to describe an ellipse, passing over the top of the plants.

Claim.—1. The combination of the wheel C, cog-wheel D, pinion *d*, crank-shaft E, slotted bar A, and set-screw *i* with the main frame A, all substantially as set forth.

2. The combination of the hoe H, or its equivalent, springs L L', jointed handles G G', crank-shaft E, and bar I, all substantially as and for the purposes herein set forth.

145,850.—Medical Compound.—GILBERT DÉCLAT, Paris, France. Application filed December 2, 1873.

Claim.—The preparations and the applications before described of the phenic acid incorporated with the ammonia and with the sulphydric acid in order to constitute, first, a previous compound, which I name "ammoniacal phenic acid," and, secondly, a completed compound, which I name "ammoniacal sulpho-phenic acid," substantially as before described, and for the purposes set forth.

145,851.—Lightning-Rod.—JOSEPH DREW, Wenona, Ill. Application filed July 23, 1873.

Claim.—The tubular lightning-rod, as herein described, that is composed of connected tubular sections, each having a side seam fastened at one end, and open and compressible at the other end, said sections having, respectively, the corrugations *s* and shoulders *s'*, arranged as and for the purpose specified.

145,852.—Horse-Rake.—CHARLES EDGAR, Dayton, Ohio. Application filed November 3, 1873.

Claim.—1. The combination of the retaining-catch *u*, arranged as described, the slide *t*, and the treadle-lever *q*, for projecting the latter to release the axle-tree.

2. The treadle-lever *q*, slide *t*, link *s*, and connecting rod or wire *r*, in combination with the retaining-catch *u* and clutch-belt *w* for simultaneously operating the same, the clutch-belt being constructed of L shape to engage with a fixed retracting-cam, *v*.

3. The combination of the elastic plates *j* and bolts *k* with the rake-teeth E and the axle-tree C, provided with grooves *n* and vertical sockets *m l*.

145,853.—Padlock.—FREDRICK EGGE, Bridgeport, Conn., assignor of one-half his right to FRIEND W. SMITH, same place. Application filed November 13, 1873.

Claim.—The padlock-case A, having a key-hole opening in its bottom, in combination with the slotted pivoted tumblers D, with shoulders on their outer ends, the spring *f*, and the hasp B, with L-shaped arm C, and projection E, all constructed and arranged substantially as and for the purposes herein set forth.

145,854.—Pessary.—CHARLES E. FLACK, Jacksonville, Ill. Application filed July 2, 1873.

The cup and its supporting-branches are of soft rubber, and the stem of hard rubber covered with soft.

Claim.—1. As a new article of manufacture, a uterine supporter having the annular cushion and supporting-branches made of flexible india-rubber, the annular cushion and branches being solid, and the latter made tapering from their bases to their upper ends, as shown and described.

2. A stem of hard rubber or other equivalent material capable of being bent and caused to remain of any required form, in combination with a soft-rubber casing and supporter, substantially as described and shown.

145,855.—Refrigerator.—ANDREW J. FINK and JOHN FINK, Reading, Pa. Application filed November 3, 1873.

The wood lining is to prevent equalization of temperature at upper and lower sides of drip-catcher.

Claim.—1. The double-inclined drip-catcher A, entirely closed at its central and highest portion or peak, having gutters *a* at its opposite lower edges, and arranged within a refrigerator directly beneath the ice-box, all substantially as and for the purpose specified.

2. The drip-catcher A, lined with wood or other non conducting material on its under side, and having an outlet-opening, *b*, for heated or foul air directly beneath its highest portion or peak, as set forth.

145,856.—Car-Wheel.—ADDISON C. FLETCHER, New York, N. Y. Application filed December 18, 1873.

Claim.—1. In a sectional car-wheel, the combined disk and screw-hub E D, in combination with the disk F, screw-nut G, and web A, substantially as and for the purpose specified.

2. A series of ball-cushions, I, interposed and seated between the clamping disks or flanges E F of a car-wheel, for relieving jars or concussions, substantially as set forth.

3. The disks or flanges E F, provided with a series of recesses or seats, H, in combination with the web B, having a series of openings, K, to receive and hold in position ball-cushions I, substantially as set forth.

4. The spheroidal-shaped rollers I, provided with a yielding or elastic integument, and combined with recesses or seats H and K, formed in the flanges E F and web B of a car-wheel, for imparting elasticity to the wheel, substantially as set forth.

5. The binding-disks E F, provided with seats or recesses H, having cavities or depressions *b* to receive the gudgeons or projections *a* of the ball-cushions I, substantially as set forth.

145,857.—Paddle-Wheel.—ADDISON C. FLETCHER, New York, N. Y. Application filed July 12, 1873.

Concave or curved paddles arranged at such an angle with the radial arms as to press downward and prevent the free escape or flow of the water over the upper edges, while readily shedding the water upon emerging therefrom.

Claim.—The paddle-bucket herein described, of parabolic or angular form, when connected to the arms or spokes of the wheel, with its upper edge arranged in advance of its lower edge, substantially as shown and described.

145,858.—Sewing-Stand.—LEANDER J. FLING, Hudson, and ABEL LAND, Hillsdale, Mich.; said FLING assignor to HORACE BLACKMAR, Hillsdale, Mich. Application filed November 29, 1873.

The legs are hinged, so as to be capable of folding underneath the table, and are held in their upright position by braces in connection with stop-springs underneath the table-top.

Claim.—1. The combination, with a table-top, A, of the cross-bars E, having offsets *a* and pins *b*, the legs D, with shoulders *c*, and the strap-hinges *d*, all substantially as and for the purposes herein set forth.

2. The combination of the hinged legs D D, connected by the stretcher G, the brace H, strap-hinge d^1, pin *i*, and grooved guides *f f*, all constructed substantially as and for the purposes herein set forth.

3. The combination of the spring-stops *h*, guides *f f*, and brace H, substantially as and for the purpose herein specified.

4. The combination of the table-top A with cushion C, the cross-bars E, with pins *b*, legs D, stretcher G, strap-hinges *d* d^1, brace H, pins *i*, guides *f*, and spring-stops *h*, all constructed and arranged substantially as and for the purposes herein set forth.

145,859.—Coloring and Preserving Wood to Imitate Slate.—JOHN O. FROSHAUG, Albert Lea, Minn. Application filed October 27, 1873.

Claim.—The herein-described process of treating shingles, or other things made of wood, to impart to them a slate color and to preserve them, by boiling them in a solution prepared by dissolving in water sulphate of iron, alum, chloride of sodium, and extract of logwood, in substantially the proportions specified.

145,860.—Fermentation-Guard for Barrels, &c.—ANTHONY P. GARDNER, Moscow, Pa. Application filed June 6, 1873.

An eccentrically-hung roller-clasp, under which a rubber strap, fastened at one end to the bung, passes, admits of said strap being adjusted to resist the pressure from the interior of the barrel.

Claim.—The rubber strap *b*, fastened at one end to the bung or barrel, and passing over an opening through said bung, and its free end held by a clasp, *d*, by which said strap may be strained to any desired tension, and so held by said clasp, as and for the purpose described and represented.

145,861.—Refuse-Burner.—WILLIAM GLUE, Muskegon, Mich. Application filed October 14, 1873.

The counterbalanced door is hinged at its lower end. It has rails continuous with the rails of the main track, upon which the car runs into the furnace, the door being opened and depressed by it. The rails are curved upward to form a stop for the car, and the door is provided with a stop to prevent its falling too far. When the load is dumped the counterbalancing weight closes the door. The drip-receiver is designed to protect the main body of the furnace from rain and snow.

Claim.—1. In combination with the furnace herein described, the conical part C, provided with projecting drip-receiver *b*, placed over the cylinder B', substantially as and for the purpose set forth.

2. The balanced door H, provided with the rail-tracks, having one end curved, as and for the purpose set forth.

145,862.—Plow.—JOHN LINDSEY GRAHAM, Carthage, Ill. Application filed January 27, 1873.

Claim.—1. The teeth R R^1 R^2, constructed in the form shown, and attached to the frame by bolts S S', arranged as and for the purpose specified.

2. The beam E, provided with the teeth L L', and the frame O, provided with the teeth R R^1 R^2, all constructed and arranged for operation as and for the purpose set forth.

145,863.—Sash-Cord Guide.—WILLIAM M. GRISCOM, Reading, Pa., assignor to READING HARDWARE MANUFACTURING COMPANY, same place. Application filed August 23, 1873.

The end pieces through which the securing-screws pass are cast separately from the rest of the case, and retained in position by the pin which secures the two cheeks together.

Claim.—A window-pulley in which are combined two cheek-pieces, A A, and two end pieces, B B, the latter being adapted to and held in place partly by the said cheek-pieces and partly by the connecting-rods *a a*, as set forth.

145,864.—Combination-Padlock.—WILLIAM N. HALL, Mexia, Tex. Application filed May 23, 1873.

Claim.—In a padlock, the separate permutation device, constructed with sockets to slide upon the ends of the separate hasp, and to be secured thereto by a notched locking-bolt, which, passing through the locking-rings, crosses both ends of the hasp and secures the lock, essentially as described.

145,865.—Key-Hole Guard.—WILLIAM N. HALL, Mexia, Tex. Application filed June 2, 1873.

The guard is secured within the key-hole of a lock by a projection upon its inner end, which engages with the lock-plate, and is prevented from being turned by a notched pin or key, which passes through notches in the revolving disks and enters the key-hole. The notched pin is held in place by the disks, and can only be withdrawn when the disks are properly adjusted.

Claim.—1. A separate portable permutation key-hole guard, consisting of a stem, A, with locking projections F, a series of permutation-disks, *c*, on the outer end thereof, a fixed head, C, removable nut D, and a removable notched pin, E, arranged for use with the disks *c* and the key-hole B, essentially as described.

2. The key-hole guard, having the permutation-disks *c*, for use with the removable notched pin E and the locking projection F, arranged and fixed upon the same stem A, as described, so that by removing the notched pin E the permutation-disk and fixed head may also serve as a handle to operate the stem-projection F to lock and unlock the bolt H, as described.

145,866.—Windlass.—WILLIAM HORATIO HARFIELD, London, England. Application filed October 23, 1873.

A self-acting clutch is interposed between the crank-shaft of the engine and the windlass-barrel, to communicate motion to the latter when worked by the engine, but allow of the barrel being rotated when worked by manual power, without imparting motion to the engine or intermediate gearing.

Claim.—1. In combination with a windlass driven by the steam-engine A B, geared with the purchase-wheels *i i*, the nipping-levers *k l m*, so applied as to pawl the purchase-wheels, and also to serve to rotate the windlass by manual power, either alone or as auxiliary to the steam-power, substantially as set forth.

2. In a combined steam and manual power windlass, a wheel, *d*, provided with a self-acting clutch, arranged between the crank-shaft of the engine and the windlass-barrel, substantially as and for the purpose set forth.

3. In combination with the windlass-barrel and the pinions *g g*, the pinions *o o*, mounted upon the lever *n*, operating substantially as shown and described, for the purpose set forth.

4. The lever *n*, pivoted directly upon the counter-shaft *b*, substantially as shown and described, for the purposes set forth.

145,867.—Fireman's Extension-Ladder.—GEORGE W. HARRIS, Lancaster, N. Y. Application filed September 10, 1873.

The extensible ladder is carried on a wheeled truck, and the base portion is elevated by swinging props hinged above and running below on hinged trackways attached to the machine, and capable of being adjusted to a proper angle of inclination. The props are drawn outward along the trackway by a rope and windlass driven by worm-gearing. The extensible portion is operated in the ordinary manner. The winding-drum is supported in a supplementary frame attached to the under side of the main frame of the truck.

Claim.—1. In combination with the swinging props *c c*, pivoted to the ladders C, and the hinged trackways D D, the gear-wheel E, longitudinal worm-rod *j*, and cords *e e*, all constructed and operating substantially as described.

2. The trackways D D, hinged on the bolster B', and in combination with the props *c c*, as and for the purpose specified.

3. The construction of the fire-escape truck, consisting of the horizontal pieces A' A'' A''', the bolsters B B, and the supplementary frames *h h'*, substantially as hereinbefore specified.

145,868.—Curtain-Fixture.—SAMUEL HENRY and MARGARETTA HENRY, Chenoa, Ill. Application filed October 20, 1873.

The head-piece is provided with end brackets having projecting hooks on their rear edges. To one of the end brackets is attached a block carrying a spring, which bears on the curtain-roller. An ornamental strip, to which lace curtains may be attached, is attached by hooks to the head-piece of the rolling curtain-fixture.

Claim.—The detachable head-piece A, provided with brackets *a a'*, block D, spring E, and roller B, in combination with the ornamental strip H, provided with hooks I I, adapted to be attached to or detached from the head-piece, the whole being arranged, constructed, and operated in the manner and for the purpose set forth.

145,869.—Stirrup.—ANDREW J. HERRING, Mauch Chunk, Pa. Application filed September 15, 1873.

Claim.—1. The wooden stirrup A, provided with the re-enforcement *a* at its center, and having its ends bent so that the half-blocks B formed thereon shall have parallel outer sides, substantially as and for the purpose specified.

2. The blocks B, having grooves G, adapted to hold the edges of the stirrup-strap S, substantially as described.

145,870.—Lamp-Extinguisher.—FERDINAND HILLE, Lyons, Iowa. Application filed November 8, 1873.

In a lamp-extinguisher actuated by a pendent weight, the hoods are operated by a serrated bar engaging cogs on the peripheries of the pivoted ends of the hoods, or by a bar and the cross-action of a spring at the pivoted end of each hood, with a wedge on each shorter side of the wick-tube.

Claim.—The combination of the pivoted flanged dampers or hoods A A, slide-bar B acting upon the hoods through cogs, spring E, lever or handle D, loop F, and pendent weighted rod G H, all constructed and arranged substantially as and for the purpose specified.

145,871.—Car-Ventilator.—MARCUS T. HITCHCOCK, Springfield, Mass. Application filed June 4, 1873.

The frame A is cast in one piece, orifices being left at the top, and cavities at the bottom, for the reception of the journals of the slats.

Claim.—The combination of the frame A, with tapering sockets *a a* in its top bar, recesses *b b* in its bottom bar, the dampers D' D D', with journals on each end, and the plates B B, riveted to the frame A, all substantially as herein set forth.

145,872.—Mowing-Machine.—EUGENE C. HOPPING, Madison, N. J. Application filed November 26, 1873.

The heel of the finger-bar is pivoted in the shoe, and the finger-bar is pivoted in the heel, allowing a two-way movement of the finger-bar.

Claim.—1. The plate or casting D, provided with ears *a a'* and hollow sleeve C with collar *c*, in combination with the shoe A, provided with a box, B, and set-screw *b*, all substantially as and for the purposes herein set forth.

2. The head H, provided with a hinged lip, A, having lug *i*, in combination with swiveled fork *m*, slotted cutter-bar G, and the button *k*, all substantially as and for the purposes herein set forth.

145,873.—Means for Checking and Securing Boats.—FRANCIS M. HOWES, Somerville, Mass. Application filed October 30, 1873.

Claim.—The lever F provided with pivoted clamp F^1 and hook-chain F^2, in combination with single chucks C, as and for the purpose described.

145,874.—Respirator.—BUSHROD W. JAMES, Philadelphia, Pa. Application filed March 8, 1873.

A valve is inserted in the central portion of a respirator, which is arranged to be held between the lips and the teeth. The perforated plates which go to make up the respirator are detachable, and inclose between themselves a strainer, preferably of fibrous material.

Claim.—1. A respirator, consisting of two detachable perforated plates, A B, and intervening strainer D, the whole being constructed as described, so as to be retained between the lips and the teeth.

2. A respirator, constructed as described, so as to be retained between the teeth and the lips, and provided with a strainer, D, and with a valve opening outward and covering an opening in the strainer, as set forth.

145,875.—Portable Fence.—RUFUS JOHNSON, Griffin, Ga. Application filed November 13, 1873.

The fence-rails are held in an inclined position, and in a continuous line, between double-front braces of triangular supports, and secured in position at top and bottom by blocks binding against the braces.

Claim.—The combination of the sills A, supporting bars B, braces C, rails D E, bars G, and blocks *a b*, all constructed and arranged substantially as and for the purposes herein set forth.

145,876.—Safety-Valve.—JOHN JORDAN and ALFRED PAUL, Liverpool, England. Application filed November 12, 1873.

In connection with the valve, a piston is arranged to be raised on access of the steam to the piston-chambers, when said steam is too abundant to pass through perforations in said chamber and piston, thereby largely increasing the exit area for the steam by increasing the lift of the valve.

Claim.—The loaded valve *a* and its piston *b*, in combination with the fixed perforated chamber *d*, adapted to the said piston and containing the seat of the valve, all as set forth.

145,877.—Windmill.—JOSIAH KEELER and CHARLES C. HARRIS, Kewanee, Ill. Application filed August 7, 1873.

The wheel is strengthened by a novel system of bands and braces. The hollow vertical cylinder is in three parts, the smallest and highest of which carries a pivotal cylinder, to which are attached the braces which form the bearings for the shaft. From one of these braces extends an arm perforated with holes to receive a catch on one of the chains carrying the compensating-weight. The other chain is attached to a casting on the tail. A shifting-rod is connected to the vane and the other of the above-mentioned braces by chain and pulleys. The rod connecting the eccentric-wheel of the shaft to the pitman of the pump is in two parts, one-half encircling the vertical cylinder.

Claim.—1. In the wheel of a windmill, the combination, with the fans or vanes a^5 and the hoops or bands a^{12}, the braces C and hoops or bands a^{10} a^{11}, arranged and constructed substantially as and for the purposes described.

2. In the connecting or driving rod *m* of a windmill, the parts m^1 m^3, composed of semicircular portions m^2 m^4, forming the strap to hold the flanges of the eccentric-wheel *r*, lugs or ears m^5 m^6, extension m^8, bearing m^7, curved extension m^9, provided at m^9 with a vertical arm having a bearing, m^{10}, at its lower end, in combination with the main vertical standard *c*, ring or band *n*, slots or grooves c^4 c^4, and the working or pumping rod *q* all arranged, constructed, and operating substantially as shown and set forth.

3. In a windmill, the wheel A, horizontal shaft *d*, in combination with the connecting-rod *m*, main vertical standard *c*, ring *n*, formed of parts n^1 n^2, axles or projections n^3 n^4, ears or flanges n^5, and the arms q^1 q^1, lugs or ears q^2 q^2 of the working or pumping rod *q*, all arranged and constructed and operating substantially as shown and described.

4. In the automatic shifting devices of a windmill, the main hollow standard *c*, cylindrical portion or pivot *g*, arms or extensions g^1 g^2, forming the bearings for the horizontal shaft *d*, arm or extension g^3, provided with holes g^4, in combination with the arms f^1 f^2, tail f^3, chains or ropes h^1 h^2, weight h, loop or ear f^4, inclined transverse bar *i*, stud or projection i^2, forming a stop to the wheel A, horizontal shaft *d*, and wheel A, all arranged, constructed, and operating substantially as set forth.

5. In the shifting mechanism of a windmill, the shifting-rod *l*, in combination with the main hollow standard *c*, chain or rope g^4, pulleys f^5 i^3, inclined transverse bar *i*, and stub or projection i^2, loop or ear g^5, horizontal shaft *d*, and wheel A, all arranged, constructed and operating substantially as shown and described.

145,878.—Bung for Beer-Barrels.—EDWARD KRAFF, Tyrone, Pa. Application filed October 6, 1873.

The bung has at the top a circular recess, terminating at the bottom in a countersunk seat for the valve, the stem of which passes through a longitudinal hole in the bung, and has on its lower end an adjustable disk to limit the distance to which the valve shall rise to permit the superfluous gas to escape.

Claim.—The bung *a*, having the recess *c*, seat *d*, and opening *b*, in combination with the stem *e*, valve *g*, and disk *i*, substantially as shown and described.

145,879.—Piano-Action.—RUDOLPH KRETER, New York, N. Y. Application filed November 22, 1873.

Instead of the jack reaching the hammer-butt through a slot in the repeating-lever, the jack and repeat-lever are both cut away upon adjacent sides to pass each other.

Claim.—1. The jack J, cut away on one side, as at *c*, in combination with the repeating-lever I, having a lateral recess, *d*, substantially as and for the purpose or purposes herein set forth.

2. The repeating tongue or check K' on the lever I, applied to check the descent of the hammer, essentially as and for the purposes specified.

3. The post or wire L, in combination with the levers K I, the spring *g*, and button k, substantially as herein described.

4. The let-off lever E and its adjusting-screw *h*, in combination with the rail D and jack J, essentially as specified.

145,880.—Coffee-Roaster.—HENRY C. LOCKWOOD, Baltimore, Md. Application filed September 13, 1873.

The outer case is lined with soap-stone. As the coffee on being discharged falls through the hopper R, it is carried by the buckets and endless belt to the chute at the upper end of the conveyer, where it falls into bags. From one side of the case of the elevator air is conducted to the rear of the roaster, and is there discharged into the space beneath the fire-grate.

Claim.—1. The roasting-drum C, provided with an endwise movable discharging-head, C^2, which is held in place against a collar, *p*, on shaft D, by springs *s* on supporting-rods *s'*, substantially as described.

2. The hinged sectional hopper R, arranged below the discharging end of the roasting-drum C, and in front of the furnace and ash-pit doors, as and for the purpose described.

3. The inclined perforated trunk E, with its endless belt of buckets i^3 and diverging tubes *k*, combined with the receiving-hopper R, substantially as specified.

4. The perforated elevator-trunk E communicating with a fan-case, F, by means of a pipe, P, and constructed with an air-box, *z*, on one side, substantially as and for the purpose described.

5. The open fan-spout k^3, communicating with the space beneath the fire-chamber, in combination with a pipe, P, leading from an elevator-trunk, E, substantially as and for the purposes described.

6. In a coffee-roasting machine, the chute *j* attached to the case A, adapted to receive the removable adjustable hopper J, and opening into the charging-spout *j'* upon the movable head C^2, substantially as and for the purpose specified.

7. The ball *f*, combined with the endwise movable discharging-head C^2 and closing springs *e*, as described.

145,881.—Draw-Head for Railroad-Cars.—HARVEY C. LOWRIE, Fort Wayne, Ind., assignor of one-half his right to W. A. ROBERTS and DANIEL GIBSON, same place. Application filed November 18, 1873.

Claim.—The lateral-jawed draw-head composed of the longitudinal bars and the jaw-brace B, substantially as described.

145,882.—Loom-Shuttle Relief Mechanism.—WILLIAM C. MACOMBER, Mystic River, Conn. Application filed December 8, 1873.

The shuttle is held firmly in the box, and also relieved before being picked, by means of a double cam on the tappet-shaft. A vertical rod, loosely pivoted to an arm projecting back from the protector-rod, connects the latter with the actuating cam-lever, which is provided with an adjustable shackle having a pin working in a slot in the lower end of the vertical rod. The weight of this rod is sufficient to hold the fingers of the protector-rod in contact with the shuttle-binders.

Claim.—1. In combination with a shuttle-binder for looms and the mechanism for operating the same, the shackle J, slotted connecting-rod K, and pin *b*, constructed and arranged substantially as and for the purposes herein set forth.

2. The combination of the cam G, lever H, with roller *a*, shackle J, connecting-rod K, and shaft L with arm *d*, and fingers *f f*, all constructed substantially as and for the purposes herein set forth.

145,883.—Combined Paper-Weight and Sponge-Holder.—DAVID R. MANNING, Brooklyn, assignor to JOSEPH J. WALTON and WILLIAM M. WALTON, New York, N. Y. Application filed December 2, 1873.

Claim.—As a new article of manufacture, a combined paper-weight and sponge-holder, consisting of a base, A, a post or standard, B, and a ring or holder, C, substantially as and for the purpose herein specified.

145,884.—Nutmeg-Grater.—THOMAS MARRIOTT, Detroit, Mich. Application filed September 27, 1873.

A grating-disk, turned by a crank, is arranged in a box in which there is a spring, with a plate attached to bear upon the nutmeg, the handle of the spring extending through a slot in the lid of the box.

Claim.—The rotary rasping-disk D, arranged inside of a box, A, which is divided by a diaphragm, C, in combination with a pressure-plate, *e*, applied to a spring-arm, E, which is extended through a cover, B, substantially in the manner and for the purpose described.

145,885.—Carriage-Pole Tip.—SAMUEL MASON, Hamden, Conn. Application filed April 16, 1873.

Claim.—As an article of manufacture, the herein-described carriage pole or tip, consisting of the tubular portion A, with the straps B C projecting therefrom, and the eye D formed on its forward end, and the downward-projecting holdback E, all formed in one and the same piece, from cast metal, substantially as set forth.

145,886.—Bird-Cage.—JOHN MAXHEIMER, New York, N. Y. Application filed September 2, 1873.

The soft-metal bead that connects the wires at their intersection is provided with a perforated metal plate, through which perforation a portion of the bead passes, the parts being secured to each other in the process of casting.

Claim.—The combination of the cage-wires A and B with the cast-metal bead C and perforated sheet-metal plate D, the plate being connected with the bead by a projecting stud, which passes from the bead through the plate, substantially as herein shown and described.

145,887.—Piano-Truck.—FRAZEE B. MCGREGOR, Pontiac, Mich. Application filed July 25, 1873.

So constructed that it can be easily handled by one man.

Claim.—The main frame A, with rollers B B, hinged or pivoted frames C C, board E, padded bars D D, cord or rope *a*, and windlass G H, all constructed, arranged, and combined substantially as and for the purposes herein set forth.

145,888.—Shutter-Fastening.—HERBERT H. MINER, Boston, Mass. Application filed November 17, 1873.

A double-armed latch-lever, having the usual form of draw-rod, is pivoted in vertical position to the lower part of the shutter or blind, the latch projecting downward through a slot or guide. There are also elbow-shaped catches inserted in the window-sill and upon the wall of the building, with which the vertical latch engages to hold the shutter open.

Claim.—The double-armed latch-lever C, pivoted to the shutter or blind, as set forth, in combination with a draw-rod, D, connected to its upper end, and extending therefrom to or near the hinge-stile, a spring, *c*, for controlling the action of said latch, and suitable catches secured to the window-sill and the wall of the building, all substantially as described.

145,889.—Seed-Drill.—DAVID N. MINOR, Charlton, Iowa. Application filed June 14, 1873.

An outer frame is supported upon a grooved covering-roller, which also supports the seed-box. The furrow-openers are hinged in a gang to the forward end of the frame, and can be raised from the ground simultaneously.

Claim.—1. The frame B, C, C′, and C″, and supporting-frame I, when mounted upon the grooved roller A, in the manner and for the purposes set forth.

2. The frame and the seeding mechanism, when the several parts are combined with each other and are mounted upon the grooved roller A, in the manner and for the purposes set forth.

145,890.—Feed-Gage for Printing-Presses.—CHARLES N. MORRIS, Cincinnati, Ohio. Application filed April 10, 1873.

The rigid gage-arm is pivoted to the vertical short arm of the rock-shaft in such a manner that the rotation of the shaft will move the gage in a horizontal direction until the long arm comes in contact with the adjustable screw, when the gage will be raised.

Claim.—The rigid gage-arm A, pivoted to a vertical arm, B, of the rock-shaft D, in combination with a horizontal arm, C, thereof, substantially as and for the purpose specified.

145,891.—Curry-Comb.—SIDNEY A. MORTON, Wadesborough, N. C. Application filed June 10, 1873.

Claim.—The curry-comb herein described, consisting of the series of plates B of gradually-decreasing width, the rods *a a*, and bar D, the rods extending through the handle, plates, and blocks, binding the parts securely together, all constructed and arranged as and for the purpose specified.

145,892.—Bridle for Horses.—JOHN MULLER, Philadelphia, Pa. Application filed September 25, 1873.

Claim.—The combination, with the driving-bit E, of the auxiliary bit F, carrying rollers G and suspended from the relief-rein H, passing from the top of the head gear, and the elevated loops H′ carrying the rollers J and directing the rein to the terret or saddle, as herein set forth, and for the purpose described.

145,893.—Machine for Forming Screw-Threads on Sheet Metal.—CHARLES F. NEUBER, New Brunswick, and FRANK W. PERRY, Camden, assignors to JOHN L. MASON, New Brunswick, N. J. Application filed November 6, 1873.

The threaded chucks are brought together by means of an eccentric constructed to cause a "dwell" while the cap is being operated upon, and also when the chucks are separated, to allow time for removing and replacing the cap. A removable pinion is arranged between the gears of the threaded chucks, for the purpose of adjusting and causing the threads to correctly mesh. A disk journaled on the rear of one chuck rotates freely and holds the shell or cap on the other chuck.

Claim.—1. The oscillating saddle G, in combination with the shaft K, forming the axis thereof, and communicating motion from the shaft which rotates the chuck T to the shaft on the saddle which rotates the chuck U, substantially as and for the purpose set forth.

2. The combination, with the rotating chucks T U, of the eccentric A, formed with the arc *a b*, and the yoke E, formed with the projecting bearings H H′ H″ H‴, constructed to impart an oscillatory motion to the chuck-carrying saddle G and a two-part dwell thereto—one when the threading is being accomplished, and the other when the threaded cap is to be removed.

3. The adjusting-pinion P, arranged intermediate of the gearing of the two threading-chucks T U, substantially as and for the purpose set forth.

4. The holding-disk V, arranged at the rear of the chuck, on a shaft common to both, substantially as and for the purpose set forth.

145,894.—Hub-Boring Machine.—WILLIAM S. OWEN, Oskaloosa, Iowa. Application filed December 3, 1873.

By an adjustable and centering frame which is clamped in position, the reamer is properly centered for boring.

Claim.—In a hub-boring machine, the center plate D, having the fixed centering and holding points H, hinged dogs G, and extensible clasp I, in combination with the cutter screw-stem B, as and for use as described.

145,895.—Lining for Pump-Cylinders.—WILLIAM S. OWEN, Oskaloosa, Iowa. Application filed December 3, 1873.

The metallic lining has a separate cast-iron section which supports the lining and forms at the upper end a seat for the fixed valve, and at the lower end a socket for connecting the induction-pipe to the pump-barrel.

Claim.—The pump-lining A having a separate section, D, for the fixed valve G and pump-pipe F, constructed and arranged for use as described.

145,896.—Device for Holding and Carrying Pipe-Fittings Chucks.—ANDREW J. PEAVEY and FRANK B. COTTON, Boston, Mass.; said PEAVEY assignor to said COTTON. Application filed April 22, 1873.

The chucks M are clamped by screws on a table, K, adjustable vertically by screw-supports *t*, rising from a rotatable table, J, that rests on a table, E, the latter located—and adjustable transversely by means of screw F—on table C, and table C is in turn adjustable longitudinally by means of a lever along the lower table B, that is located on the shears of the lathe.

Claim.—1. The bed-plate B, platen C, operated by lever D, platen E, operated by screw F, and bed-piece J having stop-pin O, each and all relatively constructed, combined, and arranged together for separate movement, substantially as and for the purpose described.

2. The bed-piece J, having the shouldered vertical screw-studs *t*, arranged as described, in combination with the disk K on said screw-studs, all constructed and arranged to operate substantially as herein described, for the purpose specified.

3. The vertical standards N N, attached to the bed-plate J, and carrying the set-screw S S, in combination with each other and with the cross-piece O and screw Q, all constructed and arranged to operate substantially as described.

145,897.—Making Bungs for Casks, &c.—RAFAEL PENTLARGE, Williamsburg, Brooklyn, N. Y. Application filed November 22, 1873.

Claim.—The process of making compressed wooden bungs by first cutting them taper, and subsequently compressing them uniformly all round throughout their whole depth or thickness, substantially as specified.

145,898.—Oil-Can Nozzle.—GEORGE H. PERKINS, Philadelphia, Pa., assignor to himself and ATLANTIC REFINING COMPANY, same place. Application filed October 28, 1873.

Claim.—A screw-nozzle composed of the threaded ring H, having the internal flange A, and the thin plate or disk B, united to the said flange, all substantially as set forth.

145,899.—Derrick.—ALMON K. RICHMOND, Boston, Mass. Application filed December 10, 1873.

Claim.—In a derrick, two sheaves, B B′, arranged and supported on opposite sides of the mast A, in combination with the crab-pintle D, extended down between and below such sheaves, and into the neck or body of the mast, all substantially as described and represented.

145,900.—Pegging-Machine.—GEORGE L. ROBERTS, Boston, Mass. Application filed December 11, 1873.

Claim.—1. In combination with a pegging mechanism, a jack suspended and counterpoised, substantially as described.

2. A jack-standard, the foot of which swings in any direction horizontally, substantially as described, to give the required inclination to the jack mounted upon it.

3. In combination with a pegging mechanism, a jack-standard having means for constantly resisting inclination upon its supports, and for returning it to its normal position, substantially as described.

4. The flanged prop encompassing the standard, and sliding thereon against the tension of a spring, in combination with the disk to which the standard is jointed.

5. The pendent arm, which forms the support of the swinging jack-standard, in combination with the counterpoised lever, from which it is suspended by a universal joint.

6. The combination of the jack and its sleeve, by which it may be swiveled and inclined, substantially as described.

145,901.—Cultivator.—ALFRED ROLEN, Mumford, Ala. Application filed November 19, 1873.

An improvement on former patent in the use of two beams pivoted to three slotted cross-bars, and held at any distance apart by a diagonal brace.

Claim.—The combination of the beams A¹ A², slotted cross-bars B C D, slotted and perforated brace E, and their bolts, all as and for the purpose set forth.

145,902.—Iron Fence.—TIMOTHY ROGERS, Kenton, Ohio, assignor to WILLIAM L. WALKER and BENJAMIN G. DEVOR, same place. Application filed October 3, 1873.

The clamp that secures the post to the horizontal rail is made in two parts, one of which rests on the upper surface of the rail, and the other on the under surface. These parts are bolted to the rail. From this clamp extend two pivoted bolts, between which the post is held so that it can be adjusted vertically.

Claim.—The combination, with a fence-post, of the plates G G, bolts *m m*, bolts I I, plate J, and nuts A A, with horizontal rails of a fence, substantially as set forth.

145,903.—Iron Fence.—TIMOTHY ROGERS and BENJAMIN G. DEVOR, Kenton, Ohio; said DEVOR assignor to TIMOTHY ROGERS and WILLIAM L. WALKER. Application filed August 13, 1873.

The pickets are held upon the T-shaped horizontal rails by means of clamps having lugs that embrace the two vertical flanges of the rails.

Claim.—The combination of metallic pickets A A, horizontal T-shaped rails B B, and clamps C C with grasping-lugs *b b* and *d d*, substantially as set forth.

145,904.—Umbrella.—LANGDON SAWYER, Springfield, Vt. Application filed May 2, 1873.

The ribs are in sections, having sliding joints. When the runner is pushed up the ribs are spread and lengthened. When the umbrella is closed the ribs are lengthened by lowering the sliding tube on the stick.

Claim.—1. The collar F, braces *k k*, sliding collar E, the braces *i i*, and the jointed arms *a a′*, when combined substantially as and for the purposes herein set forth.

2. The sliding tube H, collar F, braces *k k*, sliding collar E, and the braces *i i*, in combination with the stick A, the fixed collar G, and the jointed arms *a a′*, substantially as and for the purposes herein set forth.

145,905.—Loom-Picker.—OBREN A. SAWYER, Lowell, Mass. Application filed October 3, 1873.

The picker is held in position upon the staff by means of a metal collar, provided at its rear end with a clamping-screw. A metal strip or shield is secured to the rear face of the staff, on that portion exposed to the wearing action of the clamping-screw, and this strip is bent at the top to prevent the collar from working off the staff.

Claim.—The combination, with the picker-stick B and picker A, of the adjustable metallic collar C, having the screw *d* in one end, and the L-shaped metallic strip *a*, said strip being permanently secured to the stick, and the collar C applied to the picker, substantially as shown and described.

145,906.—Middlings-Purifier.—ISSACHAR SCHOLFIELD, Dunlap, assignor of one-half his right to BENJAMIN F. FREDRICK, Marshall county, Iowa. Application filed August 16, 1873.

Meshes of the cloth kept clear by means of hammers striking upon the devices that connect the series of sieves together. The arrangement of devices, as shown and described, for removing the bolted material and returning some of the material termed "returns" to the hopper, to be again bolted.

Claim.—1. The combination, with the sieves G and hammers K, operated as described, of the fan T, receptacle M, passage N, and chimney P, with their respective conductors O O¹ O², the elevator R, and spout P, arranged in a relative position to each other, substantially as shown and described.

2. In a middlings-purifier, sieves G, having pieces of leather *e* glued to each side of each sieve-cloth, and blocks *f* placed between said leather and sieves and firmly secured by means of bolts *d* passing through said parts, in combination with hammers K, as and for the purpose mentioned.

145,907.—Driving-Belt.—ALEXANDER SCHPAKOWSKY, St. Petersburg, Russia, assignor to BRUNO HOFFMARK, same place. Application filed November 13, 1873.

The driving-belt consists of a series of oval or flattened helices connected by intermeshing the adjacent elongated extremities and inserting a transverse rod or bolt between the intermeshed parts. Each helix is composed of a single piece of wire and extends the width of the belt.

Claim.—A driving-belt composed of a series of flattened helices, *a a′ a″*, connected by intermeshing with each other the coils of each helix, and securing them by means of the rod *c*, substantially as herein set forth.

145,908.—Belt-Tightener.—WILLIAM SELLERS, Haverhill, Mass. Application filed October 15, 1873.

The journals of the driven pulley are supported in sliding boxes, whereby the driving-pulley is moved away from the former, so as to produce the required amount of tension of the belt. The shaft of the driven pulley is adjustable vertically, so as to maintain the drum in a true running position.

Claim.—The combination, with the main or driving-drum A and the endless belt C, of the drum D, supported in sliding boxes, and provided with means, as described—viz., the cammed levers H H and their operating mechanism—whereby the latter drum may be forced outward, so as to produce any desired tension of the belt, as set forth.

145,909.—Knife-Cleaner.—CEVEDRA B. SHELDON, New York, N. Y. Application filed August 20, 1873.

Claim.—A spring-pressed holder, E, provided with the horizontally-slotted piece F on the top thereof, combined with a lever, G, fulcrumed on frame, and having the side pivot *g* working in said slot, as and for the purpose set forth.

145,910.—Clothes-Mangle.—SEMELE SHORT, Cincinnati, Ohio. Application filed December 10, 1873.

Two hollow metal rollers, which contain heaters, are placed in a frame. Below these are two rolls or rollers, with clamps for holding the articles mangled, over which two rollers fitted in arms operate to keep the goods close to the heated rollers.

Claim.—The mangle constructed, as herein described, with clamp-rolls B B′, metallic cylinders E E′, heaters N N′, springs F F′, caps H H′, idlers I J J′, and springs P, the whole mounted in a suitable frame and driven by suitable gearing, in manner substantially as and for the purpose set forth.

145,911.—Washing-Machine.—SEMELE SHORT, Cincinnati, Ohio. Application filed December 10, 1873.

Within a suitable vessel are two rollers, with slots and bars for holding the ends of the articles to be washed as they pass between two corrugated rollers, and two rollers actuated by springs. A suitable clutch throws the rollers in and out of gear with the driving-gearing.

Claim.—1. The combination of the rolls B B′, having clamps C, and the presser-rolls S T, substantially as and for the purposes set forth.

2. The combination of the reeling devices B B′ C and fluted rolls E F, as and for the purposes described.

145,912.—Drying-Frame for Lace Curtains, &c.—SEMELE SHORT, Cincinnati, Ohio. Application filed August 15, 1873.

A rectangular adjustable frame, with a valance, attached by hooks to a larger adjustable frame, with means of support in an upright position.

Claim.—The drying-frame composed of the vertical bars C D, the adjustable mortised bar *A a b*, provided with the pins E and suspension-eyes G, weighted sinking bar B *a b*, and valances F, in combination with the trestle-frame, composed of uprights J J′, horizontal cross-bars I K, coupling-hooks L, and suspension-hooks H, all as herein set forth, for the purpose specified.

145,913.—Process of Preparing Felt for Weather-Strips, Packings, &c.—FERDINAND SIEBING, New York, N. Y. Application filed July 1, 1873.

The body of the felt retains its elasticity, while the packing-surface is protected against friction.

Claim.—The within-described process of treating felt by first cutting it in strips or pieces of the required shape, then coating these pieces on one or more surfaces with starch, then grinding off these surfaces, and applying a coat of metallic paint, substantially as set forth.

145,914.—Game Apparatus.—FRIEND W. SMITH, Bridgeport, Conn. Application filed May 21, 1873.

A base set with a number of pins for use indoors with ring-quoits, the base being cushioned to avoid noise and injury by the quoits.

Claim.—1. In a pitch or toss game apparatus for parlor use, a perforated and cushioned base, for the purposes herein set forth.

2. The combination of the cushioned and perforated base A, the numbered or lettered pins C C, and the numbered or lettered rings D D, all constructed substantially as and for the purposes herein set forth.

145,915.—Fog-Signal.—WILLIAM A. STEWART, Bethel, assignor of one-half his right to TILSON H. DINSMORE, Skowhegan, Me. Application filed July 21, 1873.

A float, raised by the tide, lifts one end of a pivoted arm, which engages with and drags down a grapple, thereby winding up a weight which actuates a train of wheels, sounding an alarm.

Claim.—In combination with the float and the sounding-signals, the float-arms, the main float-lever, the auxiliary lever, the grappling-hook, drum, weight, and intermediate gearing, connected for operating the signals, substantially as described.

145,916.—Spring-Brace for Vehicles.—CORNELIUS V. N. SUYDAM, Millstone, N. J. Application filed November 22, 1873.

Claim.—In a spring-brace, the combination of the bent rod E, fixed eye *b* on reach A, cushion *d*, and adjusting-nut *c*, substantially as specified.

145,917.—Connecting-Rod.—WILLIAM L. SWITZER, Zanesville, Ohio. Application filed May 31, 1873.

Claim.—The pitman for sewing-machines having the adjustable wrist attachment, consisting of the plate B with nut *b*, the

wrist-bolt with the head and side bearing *c*, and adjustable side bearing *c'*, and nut D, as shown and described.

145,918.—Pump.—JOSEPH J. WALTON, New York, N. Y. Application filed December 4, 1873.

Two pump-cylinders placed on an iron stand have each an inlet and a discharge pipe, and two valves connecting each pipe with its cylinder. An air-chamber is placed between the two cylinders, and is cast in one piece with the discharge-pipes. The two inlet-pipes are continued through the iron stand and meet in the suction-opening.

Claim.—1. The combination of the two cylinders A A with an inlet-pipe, F, and outlet-pipe E for each cylinder, and two valves connecting each pipe with its cylinder, substantially as and for the purposes herein set forth.

2. The combination of the discharge pipes E E and the air-chamber E', all cast in one piece, for the purposes herein set forth.

3. The combination of the two cylinders A A, the side pipes E E and F F, air-chamber E', stand G, brake H, pistons B B, and connections K K, as and for the purposes herein set forth.

145,919.—Fair-Leader for Ships' Rigging.—JOSEPH J. WALTON, New York, N. Y. Application filed December 4, 1873.

Claim.—As a new article of manufacture, the within-described halyard-block, consisting of the plate A, with flanges *a a* and ears B B, and the pulley C, all constructed substantially as and for the purposes herein set forth.

145,920.—Extinguishing Fires in High Buildings.—AUGUSTUS WATSON, Washington, D. C. Application filed April 8, 1873.

A sectional metal pipe is supported on a suitable stand, and has hose-connections at its lower end. The upper end is bent to give direction to the water.

Claim.—The sectional tube A, having water-ingress openings and hose-connections B and delivery end *a'*, constructed substantially as and for the purpose described.

145,921.—Pump.—EDWARD CARLILE WHARTON, Philadelphia, Pa. Application filed November 26, 1873.

Above the check-valve is a branch pipe located at a point where freezing is not likely to occur. The interior valve in this pipe is connected to the lower valve of the working cylinder, which in turn is connected to the seat-plate above. The seat-plate and lower valve on the other side of the working cylinder have arms which act on each other. By one unusually long stroke of the lever the whole upper part of the pump may be cleared of water.

Claim.—1. The arm H', secured to the lower valve D, in combination with the arm H, projecting from the seat-plate C, and the upper valve B, when constructed and operating as set forth.

2. The auxiliary valve M of the branch L, connected to the lower valve of the cylinder A, and operating in combination with the oscillating seat-plate, as set forth.

3. The inner valve M and outer valve N of the branch L, in combination with the pipe K, valve D or D', seat-plate C, and cylinder A, as set forth.

4. The combination, with the seat-plate C, upper and lower valves, and division-plate of cylinder A, of the arms H H', connections J P, auxiliary valve M, and branch L, substantially as set forth.

145,922.—Carriage-Jack.—DANIEL R. WIGHT, Southbridge, Mass. Application filed November 20, 1873.

Claim.—The carriage-jack described, consisting of the standard A, stop J, toothed bar G, handle B, and lever D, provided with the pawl I and gravitating-guard L, all combined substantially as specified.

145,923.—Metal-Drilling Machine.—ALFRED WOODWORTH, Cambridge Village, N. Y. Application filed November 22, 1873.

On the tabular pillar E is mounted two plates or tables, F D, the former provided with a number of bearings, *f*, through which the drill-spindles *f'* pass, and the latter with bearings D^2 for the reception of the spindles of the work-tables. These spindles have rollers on the end that ride on a cam below to effect the feed of the work to the drills, both the carrying-tables being turned together for this purpose by a worm-wheel, pinion, and gear-ring on the table D. The drills are rotated by a belt passing around drums on their upper end and a driving-pulley on the shaft G.

Claim.—1. The spindle-carrying plate F and work-bed table D, applied to revolve around a hollow fixed post, E, in combination with the shaft G, wheel I, and a belt, *p*, which is applied around the spindle-pulleys h and idler-pulleys h', substantially as and for the purposes explained.

2. The worm-screw H, receiving motion from the same shaft which gives motion to the center shaft G, in combination with the wheels M M', gear-ring P, table D, and drill-carrying plate F, substantially as and for the purposes described.

145,924.—Sleeve.—GEORGE WRIGHT, St. Joseph, Mo. Application filed October 4, 1873.

A deep narrow groove is formed in the hoop from the inside, into which the edge of the wire-gauze is inserted. The ridge upon the outside is then lapped closely down against the side of the hoop and solder run into the joint on the inside.

Claim.—The grooved and lapped fold *a*, formed in the hoop A, and holding the edge of the sieve-cloth B above the lower edge of the hoop, and leaving the bread base-support C, as and for the purposes described.

REISSUE PATENTS.

5,692.—Windmill.—MONTGOMERY CROSSMAN and PRATT A. SPICER, Marshall, Mich.—Patent No. 119,971, dated October 17, 1871. Application filed June 23, 1873.

A winged and weighted governor or lever is attached to the shaft, so as to oscillate from nearly an upright to a horizontal position, and swing the wheel around from the back to the side of the mast, so as to present its edges to the wind.

Claim.—1. In a windmill, the winged and weighted governor-lever E, attached to the shaft so as to oscillate from nearly an upright to a horizontal or intermediate position, substantially as set forth.

2. In combination with the wind-wheel, the governing devices, substantially as described, arranged upon the shaft in such relation that, when acted upon by the wind, the governing devices will swing the wheel around from the back to the side of the mast, so as to present its edges to the wind.

3. The rope or stop *r*, attached to the governing-lever E and arm-stop *s*, substantially as described, all arranged and operating to control the action of the lever E in its passage from a horizontal to a vertical position.

4. The arrangement of the arm-stop *s*, attached to the turn-table or pivot to arrest the further motion of the lever E from a horizontal or inclined position, or throwing the side wing *m'* below a horizontal position with reference to the governing-lever, substantially as shown.

5. The wing *m'* to the back of the wind-wings *m* on the end of the governing-lever E, so that the downward pressure of the wind will act on the lever to prevent it from too suddenly assuming an upright position, substantially as described.

6. The winged and weighted governor-lever E, in combination with the shaft *a*, turn-table *s*, partially-revolving vane D, bent rod F, stop-rope *r*, arm-stop *s*, and wind-wings *m m'*, arranged to operate with the wind-wheel, substantially as set forth.

5,693.—Skylight.—GEORGE HAYES, New York, N. Y.—Patent No. 100,143, dated February 22, 1870. Application filed November 1, 1873.

The hollow rafters are composed of sheet metal, bent to form rabbets for the support of the glass and gutters to conduct off the water. To give the rafter a solid appearance a V-shaped sheet-metal molding is attached to the under side, and bent up over the edges of the gutters. The cross-beams are also hollow, and are provided with gutters, which connect at their ends with the gutters of the main rafters. The panes abut against each other, with a metal clip between them which laps under and over the adjacent edges of the glass, so that the water that finds its way between the ends of the glass is conducted to the gutters. A foot-strip projects upward from the plate of the roof, against which the lowermost glasses rest.

Claim.—1. The metallic bar or rafter A, formed of a hollow sheet-metal body, *a*, constructed and arranged to form rabbets *b b* for the glasses and gutters *c c*, substantially as specified.

2. The stay-plate *f*, in combination with the hollow sheet-metal bar or rafter A, composed of a main body, *a*, rabbets *b b* for the glasses, and gutters *c c*, essentially as described.

3. The hollow molding *d*, in combination with the hollow sheet-metal bar or rafter A, having a main body, *a*, rabbets *b b* for the glasses, and gutters *c c*, substantially as specified.

4. The metallic bar or rafter A, formed of a hollow sheet-metal body, *a*, stay-plate *f*, and hollow molding *d*, fitted together and arranged to form rabbets *b b* for the glasses, and gutters *c c*, essentially as specified.

5. The combination of the cap-plates D with the hollow metal bars or rafters A, essentially as shown and described.

6. The combination of the cross-gutters *h* with the glasses C, arranged to form a butted joint, substantially as described.

7. The clips *I*, in combination with the cross-gutters *h* and main gutters *c c*, essentially as specified.

8. The foot-strip F, arranged to project upward from the frame G for the lowermost glasses to rest against, in combination with the main gutter *c*, cross gutters *h*, and outlets *i*, substantially as specified.

5,694.—Process of Preparing Wood for the Manufacture of Buttons.—ROBERT H. ISSELL, New Milford, Conn.—Patent No. 134,296, dated December 24, 1872. Application filed November 5, 1873.

Claim.—1. The method of preparing wood for the manufacture of buttons by first removing the albuminous matter by means of a solvent, and subsequently causing the material to absorb gum-lac or japan, substantially as and for the purpose set forth.

2. The blanks for the manufacture of buttons, prepared as described, and treated with steam in a steam-box, substantially as and for the purpose set forth.

3. As a finishing process in the manufacture of buttons from wood, vegetable ivory, &c., the facing of such buttons by means of a rotating punch or mandrel acting under pressure, substantially as set forth.

5,695.—Paint.—D. R. AVERILL, New Centreville, N. Y., assignor to THE AVERILL CHEMICAL PAINT COMPANY, New York city.—Patent No. 66,773, dated July 16, 1867; reissue No. 3,051, dated duly 28, 1868; reissue Nos. 3,597, 3,598, 3,599, 3,600, and 3,601, dated August 17, 1869. Application filed December 16, 1873.

Solution of acetate of lead, zinc, silicate of soda, lime, and linseed-oil, combined and compounded with zinc and oil.

Claim.—An oleaginous metallic paint, mixed ready for use, put up in suitable packages for storage or transportation, as a new article of manufacture and commerce.

5,696.—Nailing-Machine for Boots and Shoes.—LYMAN R. BLAKE, Boston, and ASA S. LIBBY, Lawrence, assignors to GORDON MCKAY, trustee of THE MCKAY SEWING-MACHINE ASSOCIATION, Boston, Mass.—Patent No. 76,150, dated March 31, 1868. Application filed December 15, 1873.

Claim.—1. A work-supporting horn, substantially as described, in combination with a mechanism which operates to drive nails or pins by pressures or percussion.

2. In combination with a nailing mechanism, a rotating work-supporting horn.

3. In combination with a nailing mechanism, a horn that yields and moves in a vertical direction, substantially as described.

4. The combination, with the presser foot, of mechanism which operates, by reason of any change in height at which the presser-foot rests on the stock, to automatically cut nails or pins from material supplied for that purpose, to a length proportioned to the thickness of the work at the place where the presser-foot operates.

5. In combination with mechanism by which nails are supplied to the action of a nail or pin driving mechanism, means for automatically driving the nails in a direction which is inclined in the general direction of the row of driven nails.

6. Means for automatically driving each nail in an inclined direction opposite to the inclination of the driven nail preceding, substantially as described.

7. In combination with the presser-foot or other device resting on the surface of the stock, and with the nail-driver, means for automatically changing the position of the operative end of the driver, so that the point to which said end will descend at each stroke will depend upon the thickness of the stock at the point where operated upon, and will have a definite relation to the surface of the stock at each descent of the driver.

8. The process or method of uniting the soles and uppers of boots and shoes by successively cutting nails from a continuous wire, the lengths of which are varied as the thickness of the material to be united changes, and driving each in succession into the solid or imperforate leather held against the nail-tube foot.

9. For uniting the soles to the uppers of boots and shoes by means of nails cut from continuous wire, the combination of the following instrumentalities: First, a wire-feeding mechanism, so constructed that the lengths of the nails cut from the wire can be altered without arresting the action of the nailing-machine; second, a wire-nail-driving mechanism; and third, nails cut from a continuous piece of wire of sufficient stiffness to penetrate the soles and uppers of boots and shoes without the previous action of an awl or piercing-instrument.

10. For uniting the soles of boots and shoes to their uppers by metallic nails or fastenings cut from continuous wire, the combination of a wire-feeding mechanism, so arranged that the length of the nails may be altered to suit the varying thickness of the stock without arresting the action of the machine, with nails or metallic fastenings, so formed that their points or ends which first enter the stock shall clinch on the inner sole or inside of the shoe against a horn or similar resisting surface, causing the fastening to clinch.

5,697.—Machine for Removing Snow and Ice from Roadways.—MATTHEW C. BOGIA, Philadelphia, Pa.—Patent No. 37,897, dated March 17, 1863. Application filed November 15, 1873.

Claim.—1. The method of clearing roadways from snow and ice by a portable furnace adapted to move along the roadway and to discharge the heat upon the snow and ice, thereby melting them and causing them to flow away as water, substantially as set forth.

2. The combination of a truck, a heat-generator, and a blower, as and for the purpose specified.

5,698.—Device for Clamping Whip-Sockets to Vehicles.—EDWIN CHAMBERLIN, Lansingburg, assignor, by mesne assignments, to himself and JOHN O. MERRIAM, Troy, N. Y.—Patent No. 43,896, dated August 23, 1864; reissue No. 2,387, dated November 6, 1866; reissue No. 4,787, dated March 5, 1872.—Division A. Application filed May 22, 1873.

The clamping-jaws are forced together by a bolt and nut.

Claim.—A fastening device, formed in two parts, and constructed to embrace both the socket and the dash-rail, or other part of the vehicle, and secured by a bolt and nut or screw, as and for the purpose set forth.

5,699.—Device for Clamping Whip-Sockets to Vehicles.—EDWIN CHAMBERLIN, Lansingburg, assignor, by mesne assignments, to himself and JOHN O. MERRIAM, Troy, N. Y.—Patent No. 43,896, dated August 23, 1864; reissue No. 2,387, dated November 6, 1866; reissue No. 4,787, dated March 5, 1872.—Division B. Application filed October 15, 1873.

The clamping-jaws are operated by inserting the barrel of the socket between them and pressing it into its proper position.

Claim.—In combination with a whip-socket, a clamp for securing the socket to the vehicle, said clamp being constructed to grasp the dash-rail and socket, in the manner and for the purpose specified.

5,700.—Device for Coupling Whip-Sockets to Vehicles.—EDWIN CHAMBERLIN, Lansingburg, assignor, by mesne assignments, to himself and JOHN O. MERRIAM, Troy, N. Y.—Patent No. 43,896, dated August 23, 1864; reissue No. 2,387, dated November 6, 1866; reissue No. 4,787, dated March 5, 1872.—Division C. Application filed October 15, 1873.

The clamping device is formed in a single piece of elastic metal and secured to the socket and the dash-rail by a bolt and thumb-screw.

Claim.—The fastening device consisting of the elastic band C, having jaws *a a*, bolt and nut *b c*, in combination with the socket A, as and for the purpose specified.

5,701.—Device for Shearing Sheep.—ADONIRAM J. FULLAM, Springfield, Vt., assignor to WILLIAM EARL, Jr., JOHN G. BLUNT, ROSWELL T. SMITH, and JOSEPH K. FRISBY.—Patent No. 42,572, dated May 3, 1864. Application filed June 24, 1873.

Claim.—The shearing implement consisting of the handle and comb-plate extending from its end, the engine supported by said handle, and a moving shearing-cutter, arranged to operate with the comb-plate, and operated by said engine through power supplied from a reservoir situated at any desired point, substantially as described.

5,702.—Spinning-Ring.—WELCOME JENCKES, Manchester, N. H., assignor to GEORGE DRAPER & SON, Hopedale, Mass.—Patent No. 39,657, dated August 25, 1863. Application filed September 6, 1873.

Claim.—1. The combination of a ring-rail, provided with a passage through it for the spindle, with a ring projecting partially within such passage, and with means or mechanism, substantially as described, by which such ring, on becoming eccentric to the spindle, may be moved or adjusted in such passage, and fixed into concentricity with the spindle.

2. A ring-rail having each of the sockets for the rings made larger in diameter than the neck or portion of the ring to enter it, and provided with adjusting-screws, arranged substantially in the manner specified.

5,703.—Process and Apparatus for Deodorizing and Destroying the Gases from Offal-Treating Establishments.—JACOB J. STORER, Boston, Mass.—Patent No. 131,131, dated September 3, 1872. Application filed December 11, 1873.

Claim.—1. The modification or improvement of the Whelpley and Storer furnace and apparatus for the application of pulverized fuel, by addition of an auxiliary fire-place, in the manner and for the purpose substantially as described.

2. A furnace with two fire-places, with a connecting-flue or conductor, one fire-place serving for the burning, drying, or distillation of the material, and the other for the deodorizing of the gases arising therefrom.

3. Deodorizing the offensive gases generated in heating refuse animal matter by passing them through an independently-heated furnace, fire-place, flue, or other heat-radiating chamber, wherein they may be sufficiently deodorized before escaping into the air, substantially in the manner and for the purpose described.

4. The process of deodorizing the gases from offal rendering and drying establishments, by bringing them in contact or mixture with coke, charcoal, or coal, as herein described.

5. In combination with the receptacle in which refuse animal matter is heated, evolving offensive gases or steam, an auxiliary independently-heated radiating-chamber, the whole operating substantially in the manner described, for the purpose described.

5,704.—Horse Hay-Rake.—BURTON J. DOWNING, Mitchell, Iowa.—Patent No. 142,276, dated September 30, 1873. Application filed November 22, 1873.

A spring-clutch on the inner end of a stub axle, by means of a chain, locks therewith the rake-head, and automatically dumps the accumulated hay by the advance of the propelling power.

Claim.—1. The short axle D, on which wheel C is keyed, applied in bearings in front of the main axle B, in combination with clutch U, treadle-lever V, chain S, and lever O for lifting the rake-teeth, substantially as described.

2. The arm T and gravitating-weight Z, applied to one of the collars of clutch U, in combination with the connecting-chain S, the pawl P on elevating-lever, and the rack Q, substantially as and for the purposes described.

3. The beveled lug or tooth Y on one of the clutch-collars on axle D, in combination with the chain S and elevating-lever O, as and for the purposes described.

4. The gravitating-pawl P, pivoted to the lifting-lever O, in combination with the fixed rack Q and elevating and tripping devices, substantially as and for the purposes described.

5. In a horse hay-rake, the rigid T-shaped holder M, attached to the bar J, and having extended arms, as shown, to support the coils of the continuous coiled spring N, constructed and arranged substantially as specified.

5,705.—Skate.—JOHN FORBES, Halifax, Nova Scotia.—Patent No. 40,743, dated December 1, 1863. Application filed June 23, 1873.

Claim.—1. A central lever, J, substantially as described, connecting the sole and heel clamps, and through which both are operated simultaneously.

2. A central lever, arranged to operate substantially as above described, when combined with a lever which actuates it in connecting and disconnecting the skate.

3. A plate arranged to operate said lugs, when made adjustable to the central lever, substantially as described, so that the lugs may be adjusted to receive a movement in accordance with the width of the sole they are required to grasp.

4. The foot-plate, pivoted or hinged at one end to the runner, and secured and released at the other end by a catch, K, or other suitable fastening mechanism, substantially as described.

5,706.—Take-Up for Looms.—CHARLES GARNER, New York, N. Y., assignor to MORITZ COHN, same place.—Patent No. 133,845, dated December 10, 1872. Application filed October 21, 1873.

In a loom for weaving corsets and other irregular fabrics the cloth is held by clamps or jaws to prevent any back movement, these jaws being placed on the breast-beam between the lay and take-up, and released from their hold before the lay begins to move back, and in turn to allow of any slack that may be caused by the beat of the lay to be taken up by the rolls. The jaws are covered with a yielding substance in order to retain the fabric more securely.

Claim.—1. In combination with the batten, the clamping-jaws and a take-up mechanism, the whole arranged to operate together in substantially the manner described, for the purpose set forth.

2. The jaws of the clamp for holding the woven fabric, when provided with an impressible or yielding facing or facings, substantially as and for the purposes described.

5,707.—Roller-Skate.—WASHINGTON PARKER GREGG, Boston, Mass.—Patent No. 45,929, dated July 25, 1865. Application filed November 12, 1873.

Claim.—1. A skate-stock or foot-rest having a driving-wheel, constructed as described, disposed on an outer axle, at either side of the stock, as or near the middle, the upper parts of the peripheries of said driving-wheels extending above the level of the stock, as described and shown.

2. A roller-skate, constructed with a stock or foot-rest, having a small supporting-roller under each end, and a larger driving-wheel disposed on an outer axle at each side of the stock, the upper portions of the peripheries of the driving-wheels extending above the level of the stock or foot-rest, as described.

3. In a roller-skate provided with a stock, having a supporting-roller under each end and a larger driving-roller on each side thereof, the arrangement of the driving-rollers, so that their peripheries or bearing-surfaces shall be in a plane lower than the heel and the toe-rollers, as specified.

INDEX OF INVENTIONS PATENTED DEC. 23, 1873.

	Class No.	Whole No.
Alarm, burglar, F. W. Blakemore	24	145,836
Alarm, till, J. F. Baldwin	24	145,777
Alarm, till, E. O. Wood	24	145,824
Bale tie, F. Cook	7	145,847
Barrels, bung for beer, E. Kraft	40	145,878
Barrels, &c., fermentation guard for, A. P. Gardner	40	145,860
Bedstead, sofa, E. Lord	6z	145,741
Belt, driving, A. Schpakowsky	81	145,907
Belt tightener, W. Sellers	87	145,908
Billiard table, H. W. Collender	143	145,787
Blower, fan, T. T. Prosser	12	145,753
Boats, means for checking and securing, F. M. Howes	13	145,873
Boats, mechanism for towing, G. S. Olin	13	145,813
Boiler, wash, J. C. Tilton	91	145,767
Boot, gaiter, C. Hersome	16	145,801
Boot and shoe nailing machine, Blake and Libby, (reissue)	16	5,696
Boot and shoe pegging machine, T. T. Prosser	16	145,754
Bracelet fastening, S. Cottle	86	145,788
Bridle for horses, J. Muller	72	145,892
Bung bush inserter, L. Littlejohn	40	145,807
Burner, refuse, W. Glue	149	145,861
Buttons, preparing wood for the manufacture of, R. H. Isbell, (reissue)	175	5,694
Cage, bird, J. Maxheimer	170	145,886
Can nozzle, oil, G. H. Perkins	136	145,898
Car axle lubricator, J. E. Bering	122	145,834
Car coupling, G. R. Moore	122	145,746
Car doors, operating, J. G. and G. M. Brill	121	145,839
Car unloader, grain, M. W. Bosworth	79	145,780
Car ventilator, M. T. Hitchcock	166	145,871
Car ventilator, J. D. Simmons	166	145,760
Car wheel, A. C. Fletcher	121	145,856
Car windows, ventilating, C. B. Knevals	166	145,805
Cars, drawhead for railroad, H. C. Lowrie	122	145,881
Cars, berth lock for sleeping, T. A. Bissell	121	145,835
Carpet, G. Ishiyan	95	145,803
Carriage jack, D. R. Wight	79	145,922
Carriage pole tip, S. Mason	31	145,885
Carriage top, D. B. Dorsey	31	145,730
Casks, &c., making bungs for, R. Pentlarge	40	145,897
Caster, G. W. Waitt	24	145,769
Chair, child's, R. Audrey	62	145,829
Cigar boxes from redwood, manufacture of, C. A. Hooper	160	145,735
Cisterns, construction of, L. Howe	51	145,802
Clothes mangle, S. Short	91	145,910
Cocoa nut for use in pies, &c., preparing, N. A. Classen	58	145,732
Coffee roaster, H. C. Lockwood	154	143,860
Coffin sides, apparatus for bending, J. P. Albin	176	145,827
Cooler, milk, Graves, Powers, and Graves	46	145,732
Cord, machine for making, E. Otis	127	145,747
Cores, device for forming, H. Parker	33	145,748
Cotton, bleaching damaged, J. B. Rickards	11	145,816
Cotton chopper, J. Coston	41	145,849
Cultivator, A. Cooper	43	145,848
Cultivator, A. Roden	43	145,901
Curry comb, S. A. Morton	144	145,891
Curtain fixture, H. H. Burritt	62	145,785
Curtain fixture, S. and M. Henry	62	145,868
Curtain fixture, Warner and Smith	62	145,821
Deodorising and destroying the gases from offal-treating establishments, J. J. Storer, (reissue)	96	5,703
Derrick, A. K. Richmond	79	145,899
Ditching machine, J. W. Humphreys	82	145,736
Door and window guard, J. W. White	99	145,772
Dredging machine, W. A. Collins	88	145,793
Drill, grain, J. P. Fulghum	133	145,795
Drill, seed, D. N. Minor	133	145,889
Drills, hydraulic feed for revolving rock, R. Allison	134	145,775
Drilling machine, metal, A. Woodworth	100	145,923
Drying frame for lace curtains, &c., S. Short	91	145,912
Earth closet, I. S. and H. R. Russell	8	145,756
Engine, triple cylinder, F. Brotherhood	150	145,719
Engines, balanced valve for steam, N. P. Stevens	152	145,764
Feather renovator, J. E. Schooler	68	145,759
Felt for weather strips, &c., preparing, F. Siering	151	145 913
Fence, iron, T. Rogers	52	145,902
Fence, iron, Rogers and Devoe	52	145,903
Fence, portable, R. Johnson	52	145,875
Fire arms, forming receivers for breech blocks of, E. G. W. Bartlett	18	145,717
Fire escape, L. M. Chipley	79	145,844
Fires in high buildings, extinguishing, A. Watson	118	145,930
Fog signal, W. A. Stewart	138	145,915
Furnace for heating soldering irons, J. Burgess	154	145,784
Furnace, locomotive, A. J. Stevens	143	145,819
Gage, pressure, G. H. Crosby	148	145,736
Game apparatus, J. N. Sawkins	143	145,757
Game apparatus, F. W. Smith	143	145,914
Gas, apparatus for the manufacture of illuminating, J. G. and W. Muller	66	145,810
Generator, carbonic acid gas, O. Zwietusch	1	145,774
Generator, sectional steam, J. D. Lynde	148	145,743
Grain for manufacture into flour, preparing, O. F. Cook	57	145 846
Grater, nutmeg, T. Marriott	68	145,884
Hinge, blind, O. S. Garretson	24	145,797
Hoisting machine, J. Darling	79	145,727
Hoop skirt, W. Coe	80	145,845
Hose coupling, J. Edson	81	145,731
Hub boring machine, W. S. Owen	31	145,894
Hull, ship's, E. C. Béléquic	139	145 832
Hydrant, Van Kannel and Eisenhoofer	167	145,768
Ice machine, W. Bray	83	145,838
Inhaling apparatus, E. Schofield	156	145,758
Iron and steel, manufacture of, C. Carpenter, Jr.	85	145,843
Key hole guard, W. N. Hall	93	145,865
Knife cleaner, C. B. Sheldon	70	145,909
Ladder, fireman's extension, G. W. Harris	79	145,867
Ladder and ironing board, combined step, H. H. Kendrick	91	145,738
Ladder, bench, and clothes frame, combined step, H. H. Barker	91	145,716
Lamp extinguisher, F. Hille	90	145,870
Lead, drier for, A. D. Armstrong	107	145,713
Letter clip and paper binder combined, G. W. McGill	146	145,809
Lightning rod, J. Drew	50	145,851
Lock or catch for trunks, A. V. Romadka	93	145,817
Locomotive window, J. H. Dinsmore	94	145,790
Loom picker, O. A. Sawyer	95	145,905
Loom shuttle, E. P. Ball	95	145,813
Loom shuttle guard, E. M. Stevens	95	145,763
Loom shuttle relief mechanism, W. C. Macomber	95	145,822
Loom take up, C. Gabrens, (reissue)	95	5,706
Lubricating compound, J. B. Norris	87	145,812
Mats for pitchers, &c., rubber, C. A. Price	62	145,815
Medical compound, G. Déclat	98	145,850
Medical compound, Pawlewski and Schuls	98	145,749
Mill, grinding, D. A. Caldwell	57	145,786
Mirror, hand, J. F. Dohan	161	145,729
Mirrors, adjustable hanger for, J. Wright	62	145,825
Miter machine, T. Pooley	29	145,751
Molding apparatus, W. C. Amiah	33	145,824
Molding machine, N. Jenkins	173	145,804
Mowing machine, E. C. Hopping	74	145,872
Nail delivering machine, S. S. Putnam	103	145,755
Nail driving machine, A. Smith	29	145,818
Nail separating device, H. B. Chess	103	145,730
Nipper for twisting wire, J. W. Fry	170	145,794
Paddle wheel, A. C. Fletcher	139	145,857
Padlock, F. Eggs	93	145,853
Padlock, combination, W. N. Hall	93	145,864
Paint, D. R. Averill, (reissue)	107	5,695
Pan, dust, O. C. Forsyth, Jr.	62	145,792
Paper weight and sponge holder combined, D. R. Manning	146	145,883
Peg cutter, C. H. Becco	16	145,714
Pegging machine, G. L. Roberts	16	145,900
Pen wiper, H. S. Ball	146	145,778
Pessary, C. E. Flack	156	145,854
Piano action, R. Kreter	112	145,879
Piano truck, F. B. McGregor	31	145,887
Piano and organ attachment, L. J. Fremaux	113	145,793
Pickets, machine for shaping, A. J. Sutherland	58	145,766
Pie marker, T. S. Macomber	88	145,808
Pipe fitting chucks, device for holding and carrying, Peavey and Colton	173	145,806
Planter, corn, J. S. Davis	133	145,726
Plow, J. L. Graham	114	145,862
Power, apparatus for transferring, E. B. Clark	67	145,721
Printer's furniture, H. A. Hemple	117	145,809
Printing presses, feed gage for, C. N. Morris	117	145,890
Pump, J. J. Walton	118	145,918
Pump, E. C. Wharton	118	145,921
Pump cylinders, lining for, W. S. Owen	118	145,895
Pump, quicksilver, M. P. Boss	118	145,718
Pump, steam, B. S. Lawson	118	145,806
Purifier, middlings, I. Schofield	57	145,906
Railway crossing, J. Brahn	120	145,781
Rake, horse, C. Edgar	77	145,852
Rake, horse hay, B. J. Downing, (reissue)	77	5,704
Razor strop, J. B. Lucas	44	145,742
Refrigerator, A. J. and J. Fink	58	145,855
Respirator, B. W. James	156	145,874
Rigging, fair leader for ship's, J. J. Walton	138	145,919
Rigging stopper, T. G. Bell	138	145,833
Roadways, machine for removing snow and ice from, M. C. Rogers, (reissue)	122	5,697
Roadways, machine for removing snow and ice from, C. G. Waterbury	122	145,822
Rod, connecting, T. T. Prosser	67	145,752
Rod, connecting, W. L. Switzer	67	145,917
Safe, fire-proof, Sontag and Lotz	128	145,716
Sash cord guide, W. M. Griscom	24	145,863
Saw set, E. F. Cook	131	145,724
Screw threads on sheet metal, machine for forming, Neuber and Perry	136	145,893
Scrubbing machine, W. J. Gard	91	145,796
Sewing machine, C. H. Palmer	134	145,814
Sewing machine, T. A. Weber	134	145,898
Sewing machine quilting guide, F. G. Buschmeier	134	145,841
Sewing stand, Fling and Land	62	145,858
Shearing sheep, device for, A. J. Fullam, (reissue)	144	5,701
Shoe fastening, S. Babbitt	16	145,776
Shutter fastening, H. H. Miner	24	145,888
Sieve, G. Wright	170	145,924
Skate, J. Forbes, (reissue)	143	5,705
Skate, roller, W. P. Gregg, (reissue)	143	5,707
Skylight, G. Hayes, (reissue)	8	5,693
Snow and ice from roadways, machine for removing, M. C. Bogis, (reissue)	122	5,697
Snow and ice from roadways, machine for removing, C. G. Waterbury	122	145,822
Sofa, chair, &c., A. S. Newhouse	62	145,811
Spading machine, J. G. Jones	114	145,737
Spinning ring, W. Jenckes, (reissue)	142	5,702
Spring brace for vehicles, C. V. M. Suydam	31	145,916
Square, try, L. Bailey	29	145,715
Stalks, apparatus for binding, S. Kuh	75	145,739
Stirrup, A. J. Herring	72	145,869
Stove, heating, I. G. Macfarlane	154	145,744
Tack puller, C. W. Blakeslee	29	145,837
Tallow, lard, &c., purifying and bleaching, J. R. Brown	47	145,840
Tank and liquid measure, combined, J. H. Corliss	132	145,725
Tool, Baker, Doney, and Owen	29	145,830
Toy gun, Mills and Wolfe	143	145,745
Toy money box, J. Hall	143	145,734
Toy pistol or gun, G. S. Hastings	143	145,796
Trap, fly, G. W. Eichholtz	143	145,791
Umbrella, G. G. Griswold	165	145,737
Umbrella, L. Sawyer	165	145,904
Valve, G. R. Crane	152	145,789
Valve, safety, Jordan and Paul	148	145,876
Vehicle wheel, D. Brown	31	145,783
Ventilating car windows, C. B. Knevals	166	145,805
Ventilator, car, M. T. Hitchcock	166	145,871
Ventilator, railroad car, J. D. Simmons	166	145,760
Wagons, apparatus for unloading corn from, T. Barron	31	145,779
Washer, ore, S. Wheeler	3	145,771
Washing machine, M. L. Hawks	91	145,779
Washing machine, S. Short	91	145,911
Water meters, manufacturing rubber diaphragms for, D. B. Spooner	167	145,762
Water wheel, J. Kunkle	168	145,740
Weather guard, J. Pease	30	145,750
Weather strip, O. A. Vorce	30	145,890
Whalebone splitting machine, D. Warner	169	145,770
Whiffletree, H. Agar	31	145,826
Whip sockets to vehicles, device for clamping, E. Chamberlin, (Div. A,) (reissue)	72	5,698
Whip sockets to vehicles, device for clamping, E. Chamberlin, (Div. B,) (reissue)	72	5,699
Whip sockets to vehicles, device for clamping, E. Chamberlin, (Div. C,) (reissue)	72	5,700
Windlass, W. H. Harfield	79	145,866
Windmill, Crossman and Spicer, (reissue)	116	5,692
Windmill, Keeler and Harris	116	145,877
Windmill regulator, D. C. Stover	116	145,765
Window blind slat operator, E. C. Byam	24	145,842
Window guard, J. W. White	99	145,773
Wind wheel, Brand, Barrows, and Armstrong	118	145,782
Wire, nippers for twisting, J. W. Fry	170	145,794
Wood to imitate slate, coloring and preserving, J. O. Froehaug	35	145,859

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED DECEMBER 23, 1873.

Agar, H., Whiffletree	145,826
Albin, J. P., Apparatus for bending coffin sides	145,827
Allison, R., Hydraulic feed for revolving rock drills	145,775
Amiah, W. C., Molding apparatus	145,824
Andrae, M., assignee	145,781
Ardrey, R., Child's chair	145,829
Armstrong, A. D., Drier for lead	145,713
Armstrong, Brand, and Barrows	145,782
Armstrong, Fawcett, and McKelvy, assignees	145,713
Atlantic Refining Company, assignee	145,893
Averill Chemical Paint Company, assignee, (reissue)	5,695
Averill, D. R., Paint, (reissue)	5,695
Babbitt, S., Shoe fastening	145,776
Bacon, C. H., Peg cutter	145,714
Baker, J. H., A. Doney, and F. N. Owen, Tool	145,830
Bailey, L., Try square	145,715
Ball, E. P., Loom shuttle	145,831
Ball, H. S., Pen wiper	145,778
Baldwin, J. F., Till alarm	145,777
Barker, H. H., Combined step ladder, bench, and clothes frame	145,716
Barron, T., Apparatus for unloading corn from wagons	145,779
Barrows, Armstrong, and Brand	145,782
Bartlett, E. G. W., Forming receivers for breech blocks of fire arms	145,717
Béléquic, E. C., Ship's hull	145,832
Bell, T. G., Rigging stopper	145,833
Bell, W. O., assignee	145,739
Bering, J. E., Car axle lubricator	145,834
Bissell, T. A., Berth lock for sleeping cars	145,835
Blackman, H., assignee	145,838
Blake, L. R., and A. S. Libby, Boot and shoe nailing machine, (reissue)	5,696
Blakemore, F. W., Burglar alarm	145,836
Blakeslee, C. W., Tack puller	145,837
Blunt, J. G., assignee, (reissue)	5,701
Bogis, M. C., Machine for removing snow and ice from roadways, (reissue)	5,697
Boss, M. P., Quicksilver pump	145,718
Bosworth, M. W., Grain car unloader	145,780
Brahn, J., Railway crossing	145,781
Brand, P., J. Barrows, and A. Armstrong, Wind wheel	145,782

COMMISSIONER'S DECISIONS.

CHARLES A. SEAMAN.—*Appeal.*

[*Appeal from the decision of the Primary Examiner in the matter of the application of Charles A. Seaman for patent for a design for* LAMP-CHIMNEY CLEANER.—*Decided January* 5, 1874.]

The form of the body or swab of a lamp-chimney cleaner held not to be subject-matter for a design-patent, because the form was adopted for practical use and not for ornament, and, in the body of a lamp-chimney cleaner, was without utility as an ornament.

The words "useful" shape in the statute relating to designs refer to the utility of ornamental form and appearance rather than to that of operative mechanical function.

By design for "an article of manufacture" as the subject of patent is to be understood ornamental forms of articles employed merely for decoration.

When "an article of manufacture" is presented for patent in order to determine to which statutory class of patents it should be referred for protection, it should be asked, Is its form, without reference to the function of the article, intended to be ornamental? and is the article itself a thing which may, for any practical purpose, have a merely ornamental configuration, and, therefore, have, in that sense, sufficient utility to warrant the grant of a patent?

The law is based upon the universal truth that the influence of the beautiful is beneficial to mankind, and there is no reason for excluding "the decorative arts" from recognition under the statute wherever there is room for real decoration.

LEGGETT, *Commissioner:*

The applicant makes a lamp-chimney cleaner with a "pear-shaped" body, and seeks a design-patent covering this form of the article. The Examiner holds that this is not proper subject-matter for a design-patent.

Under the old law, which provided that he who invented "any new and original shape or configuration of any article of manufacture" should have a design-patent therefor, Commissioner Foote held—

It (the statute) does not say "*ornamental*" design, or "artistic" shape, or configuration, and I am unable to perceive any good reasons why designs for utility are not fairly and properly embraced within the statute, as well as those relating to ornamentation merely. The line of distinction between what is useful and what is merely ornamental is, in some cases, very indefinite. (Commissioner's Decisions for 1869, p. 7.)

Commissioner Fisher expressly concurred in this opinion, and added—

I am of opinion that the class of cases named in the act as arising from "new shape or configuration" includes within it all those new changes of form which involve increase of utility." (Ib., p. 105.)

The act of July 8, 1870, adds the word "useful," and provides that "any new, *useful*, and original shape or configuration of any article of manufacture" may be patented as a design. Under this act Acting Commissioner Duncan held (Commissioner's Decisions for 1871, p. 53)—

There is here no limitation as to the use to which the article, wrought into the particular shape designed for it, is to be subjected; and no suggestion that mere beauty of form or ornamental configuration are the ends sought. In fact, the language quoted expressly implies that utility may be the sole object had in view in the invention or selection of the particular form to be impressed upon the manufacture; and I am of the opinion that, under the present statute, if a new and, at the same time, useful shape be devised for a particular article of the manufacture, even though no ornamental effect be produced thereby, the inventor of the same is entitled to protection for it under the design section of the patent law.

Upon mature deliberation, and in view of the different statutes and the decisions under them, I came to a different conclusion as to the purpose and scope of the law authorizing the grant of patents for designs, and as to the meaning of the language of the statute, construed with reference to what I conceived to be the object of the law and the ground it covered as a supplement to the statutes authorizing the grant of patents for mechanical inventions. This conclusion I announced in the case of P. C. Parkinson, (Commissioner's Decisions for 1871, p. 251.) It was to the effect that the law authorizing design-patents was intended to provide for a distinct class of inventions, "inventions in the field of æsthetics—taste, beauty, ornament;" that the words "useful" shape, in the statute relating to designs, refer to the utility of ornamental form and appearance rather than to that of operative mechanical function; and that by a design for an "article of manu-

facture" as the subject of a patent is to be understood ornamental forms of articles employed merely for decoration, the articles themselves, irrespective of mere ornamental form, frequently having mechanical utility. At last, in 1872, a case reached the Supreme Court of the United States, under the present statute, and the object of the law, at least, was definitely and authoritatively settled. The subject before the court was a certain ornamentation on the handles of table forks and spoons. The court said—

> The acts of Congress, which authorize the grant of patents for designs were plainly intended to give encouragement to the *decorative arts*. They contemplate not so much *utility as appearance*, and that not an abstract impression or picture, but an aspect given to those objects mentioned in the acts.
>
> * * * * The thing invented or produced for which a patent is given is that which gives a peculiar or distinctive *appearance* to the manufacture or article to which it may be applied or to which it gives form. The law manifestly contemplates that giving certain new and original appearances to a manufactured article may enhance its salable value, may enlarge the demand for it, and may be a meritorious service to the public. It therefore proposes to secure, for a limited time, to the ingenious producer of those appearances the advantages flowing from them. Manifestly, the mode in which those appearances are produced has very little, if anything, to do with giving increased salableness to the article. It is the appearance itself which attracts the attention and calls out favor or dislike. It is the appearance itself, therefore, no matter by what agency caused, that constitutes mainly, if not entirely, the contribution to the public which the law deems worthy of recompense. The appearance may be the result of peculiarity of configuration, or of ornament alone, or of both conjointly; but, in whatever way produced, it is the new thing or product which the patent law regards. To speak of the invention as a combination or process, or to treat it as such, is to overlook its peculiarities. * * * *
>
> Identity of appearance, or, as expressed in *McCrea* vs. *Holdsworth*, sameness of effect upon the eye is the main test of substantial identity of design. *(The Gorham Manufacturing Company vs. White*, OFFICIAL GAZETTE, vol. 2, p. 592.)

If the object of the law is to encourage "the *decorative arts*," and if "the appearance" is the new thing or product which the patent law regards," then it must of necessity be exclusively *ornamental* appearance or conformation that is the subject-matter of design patents. The active *useful* mechanical features or functions of devices, whether due to form or combination, are amply secured to inventors by the law authorizing what, for want of a better designation, have been termed mechanical patents. The only questions, then, when an "article of manufacture" is presented for patent, and there is a doubt as to which statutory class of patents it should be referred for protection, are: Is its form, without reference to the function of the article, intended to be ornamental, and is the article itself a thing which may, for any practical purpose, have a merely ornamental configuration, and therefore have, in that sense, sufficient utility to warrant the grant of a patent?

The body of a lamp-chimney cleaner is a mere swab, not intended for display, but for a very dirty use; and when not in use, it is usually kept as far out of sight as possible. It is bought by the public, not for its beauty of contour, but because its form is adapted to fit and clean the interior of lamp-chimneys. This appears to have been the view of the applicant originally, when, as the Examiner reports, he applied for a mechanical patent for this identical device. His application having been rejected upon references, he apparently sought his remedy in an application for a design. The law is based upon the universal truth that the influence of the beautiful is beneficial to mankind, and there is no reason for excluding "the decorative arts" from recognition under the statute wherever there is room for real decoration. But the province of ornamentation is a high one, and the law should not be so applied as to degrade it. "The beauty of an ornament is one great test of its utility." (Magic Ruffle Co. *vs.* Douglas, 2 Fish., p. 336.) There can hardly be sufficient utility in the way of ornamentation in the form of a swab for cleaning lamp-chimneys to justify the grant of a design-patent.

I concur with the examiner that the merit of the form of this device relates wholly to its mechanical function, and not to ornamentation, and that the application does not embody proper subject-matter for a design-patent.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, SOUTHERN DISTRICT OF NEW YORK.

CYRENUS WHEELER, JR. *vs.* CYRUS H. McCORMICK.

[In equity.—Before Woodruff, Judge.]

A patentee may maintain a suit at law upon his patent in his own name, although he is under a contract to assign it to others if it has not been executed.

But equity regards that as already done which the patentee has agreed to do, and requires that the proposed assignees be made parties to a bill in chancery brought against infringers.

If the other parties to such a contract release to the patentee all their interest in the patent, he may maintain a bill in his own name for all subsequent infringements, but not for those committed previous to the release.

Neither can he recover damages for any infringements committed after he has sold and assigned the patent.

The pendency of a suit upon a patent in one district is no bar to the prosecution of a suit upon it in another, whatever may be the effect of a recovery in such foreign suit.

A patent covers only the devices which are claimed, although others are described by way of explaining them or illustrating the way in which they operate.

When a patent is reissued in several divisions, no one of them is void, because they every one describe all the mechanism shown in the original, provided the claim in each is for a different device, which is clearly described, and there is no conflict between them.

An inventor may claim in one patent a combination of devices when they are so connected as to operate in a certain way; and in another he may claim in combination with some of those devices another one especially by means of which the operation so described is produced.

An inventor may have distinct patents for several distinct devices, although he might have included them all in one, making a separate claim for each device.

Although a patent has expired and the device covered by it can be used only in connection with other devices embraced in a patent still in life, the latter devices cannot be used without the consent of the patentee, though in connection with the first.

[*George Harding*, of counsel for the complainant.
Henry Baldwin, Jr., and *Charles F. Blake*, of counsel for the defendant.]

WOODRUFF, *Circuit J:*

On the 5th of December, 1854, the complainant, Cyrenus Wheeler, jr., received from the United States a patent for an improvement in grass and grain harvesters, for which he had made application March 16, 1854. On the 7th of November, 1859, he surrendered his patent for the purpose of obtaining reissues thereof in divisions, and on the 3d of January, 1860, the patent was reissued in seven divisions, numbered 875, 876, 877, 878, 879, 880, and 881. Of these the reissue numbered 876 was surrendered on the 6th of April, 1867, and on the 14th of May thereafter was again reissued, numbered 2,610.

On the 6th of February, 1855, another patent was granted to the complainant for an improvement in grain and grass harvesters, which was also afterward surrendered and reissued June 5, 1860, and again surrendered, and on the 28th of May, 1867, was again reissued, numbered 2,632.

For the alleged infringement of the reissued patents numbered 875, 877, 878, 879, 2,610, and 2,632, this suit is brought.

The answer sets up probably as many grounds of defense as the ingenuity of counsel could suggest. It denies that the complainant invented the devices originally patented, and denies that a machine constructed in accordance with his patents is a practicable machine, or has any useful or patentable quality. It denies the validity of the several reissues on various grounds; avers that other parties were at the time interested in the patents, and that the complainant surrendered them, and obtained reissues without their authority, consent, or concurrence; and alleges that the reissues were obtained without any legal or justifiable grounds therefor; that they embrace devices not shown in the original patent, specifications, drawings, or models, and which were not of the complainant's invention; that some of the reissues are for the same devices patented in others; that one of the reissues has expired, without extension, which included all the distinctive peculiarities shown in the original patent. It objects that other persons are jointly interested with the complainant in the patents, and that the suit is defective for want of the presence of such persons as parties. It denies the validity of the extension of the patents beyond the term for which they were originally granted. It avers the commencement of a suit in Illinois by the complainant against the defendant and another, for infringing the same patents on the 8th of May, 1869, which is still pending. It denies infringement by the defendant at any time since January 2, 1860, or that he has made or sold within the southern district of New York any infringing machines.

The defendant has moreover interposed a supplemental answer setting up, as a partial defense, that since this suit was commenced—to wit, on the third day of July, 1872—the complainant, Wheeler, sold, assigned, transferred, and set over to Cornelius Aultman, all the right, title, and interest, he, the said Wheeler, then had in the several Letters Patent and patent interests in the bill of complaint herein mentioned and therein set forth as the property of the said Wheeler. This assignment and transfer the defendant relies upon as a partial defense—that is to say, as a bar to any decree for an accounting to or with the complainant for any profits arising from infringements committed after the date of the said assignment, and as a bar to the granting of any injunction herein upon the prayer of this complainant.

Possibly in the defendant's anwer some other grounds of defense were suggested, but not all of the supposed defenses were insisted upon on the hearing.

1. The objection founded upon want of necessary parties rests upon two agreements, one of which goes, as is claimed, to the right of the complainant to maintain this suit without joining other parties. That agreement was entered into by the complainant Wheeler and others of the first part, and Cornelius Aultman and others of the second part, on the 27th of December, 1860, to continue in force for ten years. It is the same agreement that was urged as a defense as against Aultman in the suit of *Aultman* vs. *Holley et al.* It is called in that suit and in this the "consolidation contract." In deciding the case of *Aultman* vs. *Holley*, at this present term, I have considered the same objection which is now urged here, and held that that agreement did not disable Aultman to maintain a suit in his own name, upon his patents included within the scope of that agreement. The same reasons apply to the present complainant, and my opinion in that case on this point must be taken as my opinion in this, and may, if either party so desires, be inserted in this place, *mutatis mutandis*, as part of this opinion.

The other agreement was entered into by and between Wheeler, the complainant, and Henry Morgan, Allen, Mosher, and others, on the 25th of October, 1859. It recites that he had theretofore entered into certain agreements with the others, relating to his patents for harvesters, and in it he agrees to obtain a reissue of his patents, and that upon obtaining such reissue he will execute to such several other parties assignments to convey to them undivided shares or interests in all said patents now held by him, and all reissues and renewals and extensions of the same: to the said Morgan, one-fourth; to other of the persons named, one-fifth; to others, eighteen one-hundredths; and to another, seventeen one-hundredths; so that the said several parties shall become joint owners thereof, (certain specified States excepted;) that the income derived from the excepted States shall be divided in like proportions. Among other numerous detailed provisions showing the considerations moving between the parties, is one that Wheeler and Morgan, when the reissues have been obtained and the deeds of assignment are executed, are authorized to make sales of territorial rights, give licenses, to prosecute for infringements, compromise and settle claims for infringements, &c., they to render accounts, &c., to the others, and pay to the several others their proportionate share.

By a supplement another firm was admitted to share, with one of the firms who were included in the agreement, certain of the advantages secured thereby.

The defendant, in his allegation of defect of parties, names a part only of the persons with whom his agreement was made, and on recurring to the consolidation contract it appears that he has only named those who were parties to that contract also. This makes it quite apparent that the objection in the answer refers only to the consolidation contract, and has no reference to the agreement of October, 1859; nevertheless, I cannot say that an objection in the answer that Morgan and Mosher and some others specified are necessary parties does not warrant the production of this agreement of October, 1859, and any claim in respect to the specified persons which that agreement will sustain. It cannot be denied that that agreement made them equitable joint owners of the patents now in question with the complainant Wheeler. When the reissues were obtained it was the plain duty of Wheeler to make and deliver to the others such assignments as the agreement provided for, and such as would have invested them with the legal title jointly with himself; until then Wheeler might have sued at law upon his legal title for the joint benefit. In equity, their title was (in the absence of any proof of a release, reassignment, or of a rescission of the agree-

ment) as clear as his was at law. To this extent equity would regard that as done which ought to be done, and in equity their equitable title and immediate right to share the proceeds of a recovery made them necessary parties to a suit to recover for and to restrain infringements, if that objection is raised.

True, the complainant testifies that this agreement, "as far as the transfer of interest in the patents, as called for in that writing, was never acted upon." This is not sufficient to avoid the effect of the agreement; it does not show that any change was made in the relations of the parties to the reissued patents.

Their equitable titles in the shares, severally stipulated to each, became vested upon the procurement of the reissues, subject only to an accounting with certain of the parties mentioned. To vest the legal title it was necessary that the agreement should be "acted upon," but the parties, without action, could suffer Wheeler to retain the legal title and rest on their equitable rights. Proof that the agreement, in so far as it called for a transfer of the legal title, was not acted upon, does not show that it was in any manner defeated, or that it was rescinded, or that anything occurred to interfere with or interrupt its full force and effect in equity; while, on the other hand, the express admission by the complainant, in his testimony, that other writings were executed, not followed by showing what those writings were, leaves the defendant at liberty to insist upon the full force of his objection, and to presume that, had the complainant produced those writings, the equitable title of those absent parties would not be less clear.

It is, however, proved that on the 8th and 9th of July, 1868, releases were executed to the complainant by Morgan, Mosher, and certain other persons, who, by express stipulation herein, are admitted to have then been the owners of all the interest of the parties to the said agreement in question, excepting, of course, Wheeler himself. By these so-called releases the parties sell and relinquish to the complainant, his heirs and assigns, any and all the right, title, and interest, which the parties thereto can or may have, or claim either in law or in equity, in or to said patents, and any reissue or extension of the same by reason of any agreement, contract, or understanding previously had with them or those whom they represent; to be had and held by the said Wheeler and his legal representatives to the full end of the term for which said Letters Patent are or may be granted.

This operated to vest in Wheeler the equitable as well as the legal title. In respect to subsequent infringements, his right to sue in equity as well as at law was unembarrassed.

This, however, leaves to the defendant a partial defence to this suit, which was commenced on or about the 30th of June, 1870. As to infringements and profits from infringements accrued prior to those last-named releases, the objection remains, and on that ground the defendant now insists that if the defendant be decreed herein to account, such accounting shall not go back to an earlier date than July 8, 1868.

The complainant urges that this release of the equitable interest in the Letters Patent carries with it their interest in then existing claims for infringement. I think not; no such intention is expressed; the words used have no such import nor implication.

These releases, in that respect, are not unlike the instrument which, pending this suit, the complainant has executed to Cornelius Aultman, and which the defendant has set up in his supplemental answer. The only difference is that the former transfer the equitable title, and the latter both the legal and equitable title. If the latter were construed to embrace all claims to antecedent profits arising from infringements, it might be claimed to defeat the suit altogether. I must, therefore, hold the objection, for want of parties, valid to this extent—viz., that the complainant, if entitled to a decree, notwithstanding other alleged defences, cannot require the defendant to account in this suit for profits arising and accruing from infringements prior to July 8, 1868.

2. Upon the merits I shall not attempt to go into all the details of the arguments most minutely and very ably addressed to this case by the respective counsel. In one form or another they have, nearly all of them, on a like question, been under consideration in other cases heard and decided in this court between other parties. (See *Wheeler* vs. *The Clipper Company*, 10 Blatch. R., 181; *Aultman* vs. *Holley et al.*, at this present term.)

The patentable nature of the invention described in and secured by the original patents granted to Wheeler, December 5, 1854, and February 6, 1855, and the practicability of the devices patented and their utility I deem unquestionable. The contrary, though set up in the defendant's answer, is not insisted upon by his counsel.

That the reissues here in question are not invalid on the ground that they include devices not shown, described, or indicated in the original patents, their specifications, drawings, or models, has also been heretofore held, and I find no reason to change my opinion on that point.

Though alleged in the answer no ground is shown for holding the extension of the patents invalid or void.

The pendency of a suit in Illinois against the defendant and Leander J. McCormick, set up in the answer, is no bar to this suit, whatever operation, if any, a recovery here may have upon a final recovery there.

3. The invalidity of the reissues in question is most strenuously urged by the counsel for the defendant on the ground that they are several patents for the same alleged invention, and not several patents for distinct and severable parts of the invention described and shown in the original patent.

This is most elaborately and ably argued. I do not understand that the counsel for the complainant contests the legal principles urged in support of this branch of the defense. The contest is rather whether there is any foundation of fact upon which it rests; whether, according to a just construction of the several reissues, they are not in fact for severable parts of the aggregate invention included in the original patent.

I think the arguments of the defendant's counsel have not sufficiently kept in view this idea; where a patentee, having patented an aggregate of several devices, is permitted to surrender his patent and receive new Letters Patent for the several devices included in it, it does not follow that his new specifications may not be identical in their description of each and all of the devices included in the original aggregate patent. It is the patentee's selecting out of these devices some or one, being separable and capable of use as a distinct device or devices, and making that or those the subject of his specific claim that determines what is covered by each reissue. The description of an entire machine may be convenient and sometimes necessary in order to show the adaptation of the separated device to a useful purpose, and illustrate, not its construction alone, but its application, in one practicable mode, to the purpose for which it was designed. Such a description may be given, but that does not make the patent cover all that is included in the description.

In this case, then, it was competent for the patentee to amend his original specification, so as fully and minutely to describe all that was shown in the original or in its drawings or model, and receive patents for each separate device shown therein, or separate and severable combinations of devices, capable of distinct use, and, while such specification might be annexed *in totidem verbis* to each reissued patent, define and claim in each such separable and distinct part of his original aggregate invention; the specification in each case showing, as it should, the construction of each separate patented device or combination of devices, so as to give the required information to the public, and illustrating the application of each device or combination to actual use in the construction of an aggregate machine.

This does not make one reissue include all that is described in the specification. All that is included in a specification is not necessarily included in the patent. What is claimed in and secured by the patent is secured not only when used in the mode illustrated by the description of other devices with which it may be used in the specification, but it is secured against its use in connection with other devices of an entirely distinct character.

For example, in reissue numbered 2,610, the patentee claims, in combination with a harvester-frame that is free to vibrate about a gear center, a laterally-projecting finger-bar, so hinged to one end or corner of said frame as to permit the finger-bar at each end to follow the undulations of the ground over which it is drawn. This claim, read in connection with the specification, refers to and is confined to a special class of harvesting and mowing machines—viz., those in which the rise and fall of the finger-bar are effected by a vibration of the frame of the machine around the gear center, and the hinging of the finger-bar to one end or corner of that frame, so that it may rise and fall with it. It is the use of a laterally-projecting finger-bar in connection with such a frame, and hinged thereto, and also hinged so as to permit the rise and fall of either end, which is the subject of this patent. In comparison with this take either of the claims, say the first in reissue numbered 875—

> In combination with the hinged bar H and the finger-bar, the intermediate shoe M hinged to said bar H, substantially in the manner and for the purpose set forth.

Here is a limited claim to the shoe confined to its connection with the oscillating bar H and the finger-bar, in the manner pointed out in the specification. It is clear that the claim in number 2,610 might be infringed without the employment of this specific combination, and it is equally clear that the claim last above recited would not be infringed by the use of the shoe M in any other manner or combination than with the oscillating bar H mentioned therein.

It is true that the devices specified in each claim may be so used as to infringe both, but one may be used, and may infringe one of the claims and not infringe the other. As already suggested, the fact that the specification in each patent described the whole is not material. That is illustrated where there is but one patent, and of course but one specification; and yet the patentee, by his several claims, separates the devices, and, as may lawfully be done, claims the whole as an aggregate, and each separately.

A like comparison, instituted in reference to the other several claims in these reissues, leads to the same conclusion. In some the several and separate character of the devices is more plainly apparent than in others; but I think they are none of them liable to the objection that the complainant has taken more than one patent for the same device or combination.

In a certain sense, it may be said that a patent for a combination of several new devices includes them all; but this does not forbid the patentee from claiming the combination, and also claiming the several devices which enter into it, if he be the inventor of each, and they are useful by themselves or in other combinations.

It is not to my mind very clear that the complainant might not have secured all to which he was entitled by reissuing his original patents and claiming separately therein each device or combination of devices which he has claimed under several reissues. But the law permits him to divide his patent, and I find no sufficient ground for pronouncing the reissues invalid.

A ground of defense depending substantially upon the point last considered arises out of the fact alleged in the answer, that reissue numbered 880, which was founded upon the original patent of December 5, 1854, has not been extended. The term of the original patent, and of course the term of this reissue, expired December 5, 1868; whereupon it is claimed that inasmuch as the invention patented by that reissue became, on the expiration of the term, public property, and the defendant therefore became entitled to use it, first, that the defendant is not liable for any infringement since that time by the use of any thing included in that patent; and, secondly, that that reissue does in fact embrace within it the devices included in the other reissues, and so the defendant is not liable at all, or, if at all, he is not liable unless it be for infringements prior to that date. In the first place, the defendant is not sued for violating any rights secured to the complainant by the reissued patent 880. In the next place, the whole proposition fails if reissue numbered 880 embraces only a distinct and separate device not included in the other reissues, so as to be free from the objection already considered. I will not inquire whether that reissue was invalid, either as not embracing a patentable invention, or because the device which was the special subject of that patent was not new, or not the invention of the patentee. Nor will it be necessary to inquire whether the complainant is at liberty to allege the invalidity of that patent on any ground in order to avoid the conclusion sought to be drawn from the expiration of its term.

I am of opinion that nothing fell into the public domain, on the expiration of that patent, except the spe-

cial device claimed in it, and that that patent did not include the devices embraced in the other reissues upon which this suit is brought.

Bearing in mind that a patent includes no more than the patentee claims therein, it will be seen that although, as in other reissues, the specification gives a full description of the device, and of other devices which illustrate its application to use, the claim thereupon is—

The use of two hinges substantially as described, whereby the finger-beam may be folded to the main frame, in the manner substantially as set forth.

Waiving, as before, the question of the validity of this patent, it is manifest that the devices claimed in the other reissues do not necessarily permit such folding of the finger-beam to the frame. They, or some of them, provide for the rise and fall of the finger-beam at either or both ends, and for its oscillation, so as to elevate or depress the points of the fingers, but neither of them describe a construction or use adapted to this folding of the finger-bar sidewise against the frame. That is only described and provided for in the specification of this reissue 880, and it is doubtful, at least, whether the machine, as described and shown in the original patent, had any such capacity. Be that as it may, the special feature, not included in the other reissues, and in nowise essential to the operation of the devices which are therein patented, is pointed out in the specification of reissue 880, and it is the special location of the hinge by which the shoe or socket piece is hinged to the oscillating bar. The device consists in so extending the place of that hinge sidewise toward the inner or grain side of the machine as that it may clear the frame when turned or folded. All the other functions of the oscillating bar mentioned in other reissues might be effective and the finger-bar might rise and fall at either or both ends in actual use for mowing, and, so far as desired, in reaping, without this capacity of folding to the side of the main frame. This special location sidewise of the frame admitting of such folding is the specific device covered or sought to be covered by this reissue, and, whether such mere location involved any patentable quality or not it does not in itself so include the other devices that the termination of the exclusive right to employ the specific location involves also the right to use the other devices. Such location, if patentable, might be suggested by a third person, not the inventor of the other devices. If he had the right to use such other devices he might employ them in his new location. If not, his patent would be of no value, it being merely an added improvement to what was patented to another. In short, the devices included in the other reissues do not necessarily include this capacity to fold the finger-bar against the side of the frame, and the special right to extend the location of the hinge inward, so as to clear the frame, and so permit or enable the finger-bar to be thus folded, may, as an improvement, be vested in another inventor, who, nevertheless, cannot use it on a machine constructed within the other patented devices without infringing the patents therefor. Such a location of the hinges, whereby the hinged finger-bar may be folded to the side of the frame, may be applied to machines not involving the use of the other patented devices, and the right to use such a location may have become free to the public, and yet without involving the right to use such other devices. For general illustration, suppose separate patents for several devices, all of which are useful in constructing an aggregate machine—the expiration of one of the patents makes the specific device therein patented public property. But while that will warrant the use of that device in any other connection, it will not warrant a use thereof in connection with the other patented devices, unless any use thereof necessarily involved the use of such devices; nor even then, except upon the ground that there is one patentee of both or all, who, in giving the use of one to the public, necessarily gives all that is essentially necessary to make that use available. Not only so, a device may be patentable and may become public property, either by expiration of a patent or by abandonment to the public, which is useful and valuable, which, nevertheless, cannot be used except in connection or combination with other patented devices. In such cases it cannot be used save by permission of the patentee of such other devices, whether he be the former patentee of such first-named device or a third person. This exhibits the condition of the device patented in the reissue 880, even if it were conceded that it could not be used otherwise than in connection or combination with devices included in the other reissues, while, if it is susceptible of use in connection with other modes of hinging the cutter-bar, which would not include the devices claimed in such reissues, the result more conclusively follows that the expiration of that patent forms no justification for infringing the other reissued and extended patents.

5. The question of the novelty of the invention claimed by the complainant, and whether he was the first inventor, was very elaborately discussed in this court by the counsel defending the case of *Wheeler* vs. *The Clipper Company*, (10 Blatch., 181,) upon the same proofs which are presented in this hearing on those questions. The influence of the same prior patents, applications for patents, inventions, attempted inventions, experiments, and failures, upon the inventions of others, was discussed in that case, and also in the case of *Aultman* vs. *Holley*, decided at this present term, and to some extent also in *Kirby & Osborne* vs. *The Dodge and Stevenson Company*, in the northern district of New York. Those questions have again been most elaborately reviewed on some alleged new aspects of the questions considered, and I have endeavored to give to the views of counsel not only a patient but careful attention, and I am constrained to the same conclusion in this case as is stated in the former cases, and what is stated on the subject, without a discussion of each patent, invention, and experiment in detail in *Wheeler* vs. *The Clipper Company*, and *Aultman* vs. *Holley*, must be taken as my opinion in this case.

6. As to infringement by the defendant, the resistance of the charge depends very largely upon an impeachment of the complainant's title as inventor of the several devices employed by the defendant. So far as the denial of any infringement of the complainant's exclusive rights depends upon that impeachment, what has already above been said sufficiently overrules it. In relation to the specific claims infringed much that was said in the Clipper case is applicable to the defendant's machine. The infringement seems to me very clear. It includes and, in substance, uses the devices embraced in the third and fourth claims of reissue 875, and probably at least one other, but only the infringement of the third and fourth was urged by the counsel for the complainant; also, what is embraced in the claims in reissue 877, the claims in reissues 878 and 879, and 2,610, the first, fourth, fifth, sixth, and eighth claims in reissue patent numbered 2,632. The testimony of the expert, Mr. Renwick, is full and explicit, that the defendant's machine contains all these devices or combinations. My conclusion upon all the proofs is in conformity with his testimony to that effect. The witness also testifies that the defendant's machine contains also substantially the same combination described in reissue 2,632, and referred to in the third claim thereof; but as the counsel for the complainant, in his printed argument submitted, expressly states that the claims in this patent alleged to be infringed are the first, fourth, fifth, sixth, and eighth, I confine the decision to those claims.

Without further detailed discussion of the numerous points and arguments most ably presented by the counsel in this case, I must content myself with saying that, after a laborious examination of the case, I am of opinion that the complainant is entitled to a decree in conformity with the foregoing opinion, declaring the infringement and directing an account of profits; but for reasons above stated that account must begin with the date of the releases from Morgan and others, July 8, 1868, and inasmuch as the complainant has, since the filing of the bill in this case, and on the 3d of July, 1872, assigned and transferred all his right, title, and interest in these patents to Cornelius Aultman, as alleged in the defendant's supplemental answer, the account must terminate with the last-named date, after which the complainant has no interest in the profits of the defendant's infringement, and no interest to be protected by injunction. The usual reference will be made to take such account, and the amount reported must be decreed to the complainant with costs.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

27,008.—Machines for Attaching and Finishing Boot-Heels.—Granted to HERMAN SALOSHINSKY, January 31, 1860, and reissued March 26, 1867. Application filed October 28, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,020.—Variable Exhaust-Pipe for Steam-Engines.—Granted to GEORGE EDWARDS, January 31, 1860. Application filed November 1, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,023.—Calendar-Clocks.—Granted to EUGENE M. MIX and JAMES E. MIX, January 31, 1860. Application filed October 31, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,034.—Harvesters.—Granted to JOHN BUTTER, February 7, 1860; and reissued June 13, 1871. Application filed November 4, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,043.—Lock for Umbrella-Stands.—Granted to ALFRED M. FOOTE, February 7, 1860. Application filed November 8, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,065.—Coffee-Mills.—Granted to JOHN and EDMUND PARKER, February 7, 1860. Application filed October 9, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,094.—Machine for Making Cartridge-Cases.—Granted to ETHAN ALLEN, February 14, 1860, and reissued May 9, 1865, in two divisions, numbered, respectively, 1,948 and 1,949. Application filed November 11, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,135.—Sugar-Cutters.—Granted to CHARLES KIESLER and WILHELM ROSEBROCK, February 14, 1860. Application filed November 13, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,139.—Hanging Rudders.—Granted to JOSEPH P. MANTON and HENRY A. BILLINGS, February 14, 1860. Application filed November 10, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,179.—Marking-Gages for Sewing-Machines.—Granted to CALVIN D. WHEELER, February 14, 1860. Application filed November 14, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,185.—Soldering-Irons.—Granted to ABNER BURBANK, February 4, 1860. Application filed November 8, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,241.—Photographic Cameras.—Granted to AUGUST SEMMENDINGER, February 21, 1860. Application filed November 20, 1873. Testimony closes January 20, 1874. Hearing February 4, 1874.

27,291.—Seed-Planters.—Granted to JOHN S. HUGGINS, February 28, 1860. Application filed November 24, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,297.—Couches for Railroad-Cars.—Granted to EDWARD C. KNIGHT, February 28, 1860. Application filed November 29, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,303.—Fastening Saw-Handles.—Granted to JACOB NEIMEYER, February 28, 1860. Application filed November 28, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,319.—Machine for Bending Sheet Metal.—Granted to ORSON W. STOW, February 28, 1860; and reissued August 4, 1868. Application filed October 29, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,357.—Table-Cutlery.—Granted to JOSEPH W. GARDNER, March 6, 1860. Application filed December 3, 1873. Testimony closes February 3, 1874. Hearing February 18, 1874.

27,392.—Machine for Folding and Pasting Paper.—Granted to GEORGE K. SNOW, March 6, 1860. Application filed December 3, 1873. Testimony closes February 3, 1874. Hearing February 18, 1874.

27,403.—Steam and Fire Regulators.—Granted to JOSEPH WOODRUFF, March 6, 1860. Application filed December 5, 1873. Testimony closes February 3, 1874. Hearing February 18, 1874.

27,406.—Cultivators.—Granted to ROBERT CRAIG, March 6, 1860. Application filed November 22, 1873. Testimony closes February 3, 1874. Hearing February 18, 1874.

27,438.—Blackwashing-Molds for Casting.—Granted to WILLIAM FERGUSON and DAVID FERGUSON, March 13, 1860. Application filed December 10, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

27,447.—Chain for Timber-Bending Machines.—Granted to LEVI HEYWOOD, March 13, 1860. Application filed December 13, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

27,456.—Machines for Covering the Springs of Skeleton Skirts.—Granted to JOHN T. LOFT, March 13, 1860. Application filed October 6, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

27,478.—Turning-Lathes.—Granted to WILLIAM SELLERS, March 13, 1860. Application filed December 13, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

27,485.—Lanterns.—Granted to AUGUSTUS TUPPS, March 13, 1860. Application filed December 12, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

27,545.—Fitting Sinks.—Granted to JAMES INGRAM, March 20, 1860. Application filed December 15, 1873. Testimony closes February 17, 1874. Hearing March 4, 1874.

27,594.—Sewing-Machines.—Granted to L. W. LANGDON, March 20, 1860. Application filed December 13, 1873. Testimony closes February 17, 1874. Hearing March 4, 1874.

27,609.—Wringing-Machines.—Granted to SELDEN A. BAILEY, March 27, 1860. Application filed December 24, 1873. Testimony closes February 24, 1874. Hearing March 11, 1874.

27,626.—Sewing-Machine Stitch.—Granted to JAMES DAVIS, March 27, 1860. Application filed December 27, 1873. Testimony closes February 24, 1874. Hearing March 11, 1874.

27,627.—Cultivators.—Granted to CYRUS M. HALL and DAVID E. HALL, March 27, 1860, and reissued October 14, 1873. Application filed December 20, 1873. Testimony closes February 24, 1874. Hearing March 11, 1874.

27,631.—Tobacco-Screws.—Granted to NATHAN HOAG and WILLIAM H. TAPPEY, March 27, 1860. Application filed December 26, 1873. Testimony closes February 24, 1874. Hearing March 11, 1874.

27,634.—Plows.—Granted to GEORGE W. HUNT, March 27, 1860. Application filed December 26, 1873. Testimony closes February 24, 1874. Hearing March 11, 1874.

27,641.—Harvesters.—Granted to FRANK T. LOMONT and JOHN GROJEAN, March 27, 1860, and reissued June 11, 1872. Application filed December 20, 1873. Testimony closes February 24, 1874. Hearing March 11, 1874.

27,656.—Horseshoe-Nail Machines.—Granted to WILLIAM TALLMAN, March 27, 1860. Application filed December 15, 1873. Testimony closes February 24, 1874. Hearing March 11, 1874.

27,678.—Method of Fastening Artificial Teeth.—Granted to A. MERRITT ASAY and J. LAMBERT ASAY, April 3, 1860. Application filed January 3, 1874. Testimony closes March 3, 1874. Hearing March 18, 1874.

27,735.—Grinding-Mills.—Granted to EDMUND MUNSON, April 3, 1860. Application filed December 29, 1873. Testimony closes March 3, 1874. Hearing March 18, 1874.

27,736.—Ventilators for Hats.—Granted to JULIUS POLLOCK, April 3, 1860. Application filed January 3, 1874. Testimony closes March 3, 1874. Hearing March 18, 1874.

27,743.—Feed-Water Arrangement for Steam-Boilers.—Granted to THOMAS SNOWDON, April 3, 1860. Application filed December 16, 1873. Testimony closes March 3, 1874. Hearing March 18, 1874.

27,809.—Washing-Machines.—Granted to JOSEE JOHNSON, April 10, 1860. Application filed January 3, 1874. Testimony closes March 10, 1874. Hearing March 25, 1874.

28,004.—Railroad-Car Axles.—Granted to JAMES MONTGOMERY, April 24, 1860. Application filed December 17, 1873. Testimony closes March 24, 1874. Hearing March 8, 1874.

28,027.—Machines for Cutting Sheet Metal.—Granted to JOHN WAUGH, April 24, 1860. Application filed December 31, 1873. Testimony closes March 24, 1874. Hearing April 8, 1874.

28,269.—Bayonet-Scabbards.—Granted to EMERSON GAYLORD, May 15, 1860. Application filed December 19, 1873. Testimony closes April 14, 1874. Hearing April 29, 1874.

30,467.—Apparatus for Singeing Pigs.—Granted to ABRAHAM and EDWARD M. DENNY, October 23, 1860. Patented in England February 2, 1860. Application filed October 17, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

31,962.—Fare-Boxes.—Granted to JOHN B. SLAWSON, January 29, 1861. Patented in England January 16, 1860. Application filed October 7, 1873. Testimony closes December 16, 1873. Hearing December 31, 1873.

EXTENSIONS GRANTED.

26,674.—Improved Clothes-Drier, granted to B. B. HAWES, January 3, 1860.

Claim.—Two perforated hubs, H H', movable upon the shaft, in combination with the swivel-pulley P upon the shaft-head, cord C, performing the double function of expanding and elevating the frame, and the self-acting ratchet eccentric R, as applied to clothes-driers.

26,679.—Improved Double-Seaming Machines, granted to L. T. HULBERT, January 3, 1860.

Claim.—1. The rotating head, operated in the manner and by the means described, so as to produce a lateral pressure on the seam, in combination with the mode of adjusting the "direct-line" arrangement herein referred to, by means of the shank, socket, and set-screw, as described, together with the adjustable standard R, substantially as specified, and for the purposes set forth.

2. The former A', with its raised or convex border C' and tapering edge B', in combination with the rotary head D', having its edge constructed as shown, to be used in conjunction with the arrangement in first claim, for the purpose of double-seaming raised or convex work, as described and shown.

26,689.—Improvement in Pivot-Bearings, granted to FRANCIS C. LOWTHORP, January 3, 1860.

Claim.—Interposing between the plate C of a turn-table, swing bridge, or other like object, and the step or foundation plate A, a pivot, B, constructed and arranged in respect to the plates, substantially as hereinbefore described, so as to form a center on which the object connected to the plate C may roll and balance itself, and so as to present, in contact with the plate A, a self-lubricating surface.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date December 30, 1873.]

1,588.—Cigars.—GILMOR & GIBSON, Baltimore, Md. Application filed December 22, 1873.

"the figure of an owl."

1,589.—Saddle-Trees.—SAMUEL E. TOMPKINS, Sing Sing, N. Y. Application filed December 20, 1873.

"'Tompkins' New Departure Tree.'"

1,590.—Ground Coffee.—HAWLEY, BOWEN & CO., San Francisco, Cal. Application filed December 22, 1873.

"an engine and apparatus for grinding coffee, and the words 'Fresh Ground Coffee' placed thereon."

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date December 30, 1873.]

7,077.—Ruffling.—SAMUEL E. BARNEY, New Haven, Conn. Application filed December 2, 1873. Term of patent 7 years.

7,078.—Handle for Table-Cutlery.—JAMES D. FEARY, New Britain, Conn.—B. Application filed December 17, 1873. Term of patent 7 years.

7,079.—Figures.—JAMES D. SMITH, Washington, D. C. Application filed December 15, 1873. Term of patent 14 years.

7,080.—Printing-Types.—JAMES M. CONNER, Greenville, N. J. Application filed November 18, 1873. Term of patent 7 years.

7,081.—Pincushions.—ASAPH MERRIAM and CHARLES L. LITTLE, West Meriden, Conn. Application filed December 15, 1873. Term of patent 7 years.

7,082.—Label.—ALEXANDER M. THOMSON and JAMES E. TAYLOR, Chicago, Ill. Application filed November 26, 1873. Term of patent 14 years.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date December 30, 1873.]

ORIGINAL PATENTS.

145,925.—Shuttle-Guide for Looms.—JOSEPH B. BANCROFT, Hopedale, Mass., assignor to himself, GEORGE DRAPER, and WILLIAM F. DRAPER, same place. Application filed December 3, 1873.

The deflectors forming part of the columns that support the guide-rod prevent the shuttle from rising as it is about to pass the guide.

Claim.—1. The combination of the deflectors *f f* and shuttle-guard A.

2. Each of the tubular columns B B', provided with the lip *e* and deflector *f*, for application to the guard A, made substantially as shown and described.

3. The guard or guide A, constructed or bent as set forth, in combination with the columns B B', provided with the lips *e e* and deflectors *f f*, all being applied and fastened together and to the cap-bar C by means and in manner substantially as specified.

145,926.—Air-Pump.—GEORGE E. BARKER and STEPHEN F. MACK, Waverly, N. Y. Application filed May 26, 1873.

The piston is formed at the upper end with a conical chamber, to the top of which the piston-rod is connected. This chamber is perforated to admit air to the hollow center of the piston, which is closed at the bottom by a spring-valve opening downward. A cap on the bottom of the piston forms a bearing for the spring.

Claim.—In combination with the chamber E, the hollow piston F, constructed with a chamber, J, passages *j*, passage *i'*, valve I', shank I, valve-chamber *h'*, spring *i*, and cap H, all arranged, constructed, and operating substantially as shown and described.

145,927.—Hand-Rubber.—WILLIAM H. BLYE, Syracuse, N. Y. Application filed October 6, 1873.

Two rubber boards have arms at each end that are crossed and pivoted together, within one of the joints; around the pivot is a spring to throw the rubbers and arms open.

Claim.—In combination with the rubbing-pieces A and B, and arms G and H, hinged together at their centers and provided with handles E and F, the spring I, as and for the purpose specified.

145,928.—Manufacture of Imitation Medicated Wines.—VINCENT BROSSEAU, St. Sebastian, Canada. Application filed June 5, 1873.

Claim.—A compound of elderberry juice, water, ginger, and sugar, substantially as and for the purpose specified.

145,929.—Pipe-Tongs.—JAMES R. BROWN, Cambridgeport, Mass., assignor to himself and HAZEN P. HUNTOON, same place. Application filed October 31, 1873.

Claim.—In the pipe-tongs having the two crossed levers A B, and the arm C, and its adjusting-screws D E, arranged as described, the said arm C, supported by the fulcrum-pin *d*, the pin *g*, and the cross-slots *e* and *f*, arranged in the arm and the lever A, substantially in manner as shown and explained.

145,930.—Seat for School-Desks.—JAMES COOLEY, Albany, N. Y. Application filed September 23, 1871.

The seat-arm is constructed in two longitudinal sections, each provided with an ear, a recess, and a perforated flange, that together produce an arm having a recess between the ears of the hinge for the reception of a central ear cast upon the end piece of the desk-frame, and also a socket for the reception and detention of a rubber block.

Claim.—The arm B, constructed in two longitudinal sections, *d d'*, provided with ears *b' b'*, recesses *c' c'*, and perforated flanges *f f*, in combination with the end piece A, provided with ear *b* and projection *e*, substantially as and for the purposes hereinbefore set forth.

145,931.—Device for Converting Motion.—WILLIAM M. COX, Blanket Hill, Pa. Application filed August 15, 1873.

The toothed rack, to which is secured the churn-dasher, is reciprocated by means of a segmental rack; the latter is attached to a crank-shaft. A wrist-pin in the end of the crank engages with inclines on a drum revolving at right angles to the crank-shaft.

Claim.—The drum *l*, provided with inclines *m*, in combination with the pin *k*, crank *i*, section of a wheel, A, and slide *f*, furnished with arm *g*, connected to the churn-dasher D, all constructed to operate with relation to each other substantially as herein described, and for the purpose set forth.

145,932.—Stove-Leg.—WILLIAM DOYLE, Albany, N. Y. Application filed August 11, 1873.

The stove-leg shank is bifurcated, and the two forks embrace a lug near their extremity, which lug has sides inclined inwardly from top to bottom to fit the similarly inclined inner sides of the forks. This lug tends to spread the forks and bear them downwardly against external lugs near the base of the shank.

Claim.—1. In combination with a bifurcated shank of a stove-leg, receiving a key-lug between its forks to spread the same toward the side holding-lugs, the surface edges *c c*, inclining toward each other from the top surfaces of the shank to the lower surfaces of the same, substantially as and for the purpose set forth.

2. The bifurcated shank having the outer edges of its forks inclined to correspond with the inclines of the said lugs, and their inner edges inclined parallel with said outer inclines, substantially as and for the purpose set forth.

3. The key-lug made solid with the bottom plate of the stove, in combination with the side lugs or dovetails receiving the shank of the stove-leg, substantially as and for the purpose set forth.

4. The bifurcated shank made solid with the leg, and the side lugs made solid with the bottom plate and receiving the shank, in combination with the key-lug, also made solid with the bottom plate, and capable of entering the space between the said bifurcated shank, substantially as and for the purpose set forth.

145,933.—Grain-Cradle.—DANIEL DUMBLER, Coldwater, Mich. Application filed September 24, 1873.

The fingers are supported in clasps on the ends of the braces, and by means of a screw-rod and binding-nuts they may be adjusted laterally and held securely, or may be separately removed, as occasion requires.

Claim.—The combination of the clasps *b* with the adjusting-nuts *d* and screw-rod *a a*, fastened to the blade, and extending across all of the fingers of the cradle, substantially as and for the purpose described.

145,934.—Machine for Ironing Hats.—RUDOLF ECKEMEYER, Yonkers, N. Y. Application filed April 4, 1873.

Block mounted on a revolving spindle. The brim is ironed by a revolving horizontal disk-iron for the under brim, and a swinging gravitating iron resting on the upper brim. The tip and side crown are finished by irons pivoted in separate frames, (adjustable to and from each other,) swiveled in a swinging frame, moved to duty by the hand. The square is finished by the tip-iron, which is caused to traverse the square by means of segment-gear cam, moved to partially rotate the swiveled frame.

Claim.—1. The combination, substantially as before set forth, of the revolving block-holder with a revolving brim-iron having its ironing-surface arranged to revolve in the plane of the hat-brim when supported by the block-holder.

2. The combination of the revolving block-holder, the revolving disk-formed brim-iron, and the stationary brim-iron, the said two irons being arranged to operate simultaneously upon the opposite sides of the brim of the hat carried by the revolving block-holder, substantially as before set forth.

3. The combination of the stationary brim-iron and the revolving brim-iron, having their faces arranged opposite to each other, substantially as before set forth.

4. The combination, substantially as before set forth, of the revolving block-holder with a traversing iron, by mechanism, in such manner that the said iron is caused to move crosswise over the square of the hat, when the said hat is caused to revolve with the block-holder.

5. The combination of the traversing iron, the turning iron-holder, the rocking hub of said holder, and the swinging arm, substantially as before set forth.

6. The combination of the traversing iron, the turning iron-holder, the rocking hub, and the counter-weight, substantially as before set forth.

7. The combination of the traversing iron, the turning iron-holder, the swinging arm, the pressure-weight, and the counter-weight, substantially as before set forth.

8. The combination of the two traversing irons, the yokes for said irons, and the screw by means of which the said yokes are connected, substantially as before set forth.

9. The combination of the two traversing irons, the pivoted yokes thereof, the iron-holder, and the adjusting-screws which control the sway of said yokes and irons, substantially as before set forth.

10. The combination of the revolving block-holder with two traversing irons, arranged so as to operate upon the tip and side crown, and to traverse the square of the hat, substantially as before set forth.

11. The combination of the revolving block-holder with a traversing iron, the turning iron-holder, and the swinging bar, by means of which the said traversing iron can be moved from or toward the block-holder, substantially as before set forth.

12. The combination of the revolving block-holder, the traversing iron, the pivoted yoke of said iron, and the turning iron-holder, substantially as before set forth.

13. The combination of the revolving block-holder, the traversing iron, the turning iron-holder, the swinging bar, and the weight by means of which the traversing iron is pressed toward the block-holder, substantially as before set forth.

14. The combination of the revolving block-holder with the traversing iron and the turning iron-holder through the intervention of a clutch, which permits the traversing iron to be operated simultaneously with the block-holder, or not, as required, substantially as before set forth.

15. The combination of the revolving block-holder with two driving-pulleys and the clutch, so that the block-holder may be made to revolve at either of two different speeds, substantially as before set forth.

145,935.—Top-Prop for Carriages.—WILLOUGHBY P. ELAM, Petersburg, Ill., assignor of one-half his right to J. H. WILCOX, same place. Application filed November 1, 1873.

The prop is turned, by the motion of the brace in lowering the top, into a position to receive the bows.

Claim.—1. A revolving support for the bows of buggy-tops, in combination with the brace, substantially as set forth.

2. The combination of the band *a*, arm 3, sleeve 5, and support 6 with the brace 4 and bow 9, substantially as shown and described.

145,936.—Railway-Rail Chair.—SMITH FERRIS, New York, N. Y. Application filed July 13, 1872.

The rail ends are first slipped into the chair; a flat wedge, *b*, is then inserted underneath the rail ends, forcing them up against the jaws of the chair, and a locking-wedge, *c*, is lastly driven transversely through the chair, across the head of the wedge *b*, and clinched over the edge of the chair.

Claim.—The combination, with the jaws of a railway-chair, of a wedge, *b*, to be driven longitudinally under the rail, and a cross-wedge, *c*, to be driven, through an aperture in the chair, against the rear or butt end of the first-named wedge, as and for the purposes specified.

145,937.—Device for Trimming Leather.—WILLIAM F. FOLEY, Albany, N. Y., assignor to PETER R. CLUTE, same place. Application filed August 11, 1873.

Claim.—1. In a device for trimming leather while being stitched, the vibrating cutting-tool C, pivoted to the throat-piece, in combination with the slot or recess *x*, receiving the edge of said tool, substantially as set forth.

2. The slotted arm B, attached to the needle-bar, in combination with the vibrating cutting-tool C, pivoted to the throat-piece, substantially as and for the purpose set forth.

3. In combination with the arm B, the elastic foot E, substantially as shown and described, for the purpose set forth.

145,938.—Manufacture of Catches for Jewelers' Uses. GEORGE H. FULLER, Pawtucket, R. I. Application filed December 8, 1873.

Claim.—The manufacture of catches, for jewelers' and other uses, of or from a single strip of wire, by flattening and enlarging the end of said wire, and stamping or punching out the center and interior of said flattened end, and cutting the opening in the side thereof, substantially as described and shown.

145,939.—Watch-Barrel.—FREDERICK A. GILES, Jersey City, N. J. Application filed December 1, 1873.

A watch-barrel, having in one side a slot, from one end of which a tongue is bent outward to form a safety-spring, engaging with a reversible main wheel, while from the other end of said slot a short tongue is bent inward to form a hook for holding the outer end of the mainspring.

Claim.—The barrel D, having in one side the slot *a*, from which the tongue-spring B is bent outward to form the safety-spring engaging with the main wheel, while the short tongue *a* at the other end of the said slot is bent inwardly to form the fastening for the outer end of the mainspring, substantially as and for the purposes set forth.

145,940.—Machinery for Crimping the Uppers for Boots and Shoes.—CHRISTIAN GLANTZ, Baltimore, Md. Application filed July 16, 1873.

Claim.—1. In combination with the jaws C C', the toggle D and shaft *d''*, the latter provided with a right-and-left screw, *d d'*, and a wedge-nut, E, substantially as and for the purposes set forth.

2. In combination with the right-and-left screws *d d'* and wedge-nut E, the nut *f* for carrying the middle clamp J from the jaws C, as and for the purposes described.

3. In combination with the foot and leg sections A B, the hinged swivel-headed help-screw K, substantially as and for the purposes described.

4. In combination with the shaft *d''*, the collar *m*, hinged straps F F', and lateral clamps H I, substantially as and for the purposes set forth and described.

5. The crimping-tree, composed of hinged sections A B, right and-left screws *d'' d'*, wedge-nut E, lateral clamps H I, connected with hinged straps F F', center clamp J, and with or without the help-screw K, all substantially as and for the purposes set forth and shown.

145,941.—Collar and Tag Cutting Machine.—SOLOMON S. GRAY, Boston, Mass. Application filed May 28, 1872.

A series of blunt-edged knives, grouped into collar and tag forms, are arranged in adjustable segments upon the periphery of a cylinder, and cut upon the surface of a hardened-metal cylinder.

Claim.—1. The method of cutting collars, tags, cards, and other like articles from paper, paper and cloth combined, or other suitable material, by means of a series of blunt-edged knives of the proper form, arranged upon the surface of a cylinder, and to revolve, under pressure, in contact with a chilled or hardened cylindrical surface, substantially as described.

2. The die-cylinder, made up of the core C, of any suitable shape, and the segments D, D^1, D^2, D^3, D^4, and D^5, secured thereto, as they may be adjusted thereon, and having formed thereon cutting and embossing dies for shaping collars, embossing the stitching and line of fold thereon, and tag or card cutting dies, constructed and arranged to cut onto a cylinder having a hardened surface, substantially as described.

145,942.—Machine for Forcing Hoops on Barrels.—JOHN GREENWOOD, Rochester, N. Y. Application filed April 21, 1873.

The barrel is placed upon a vertically-reciprocating table which, upon rising, brings the hoop in contact with a series of adjustable stops, which force it into position.

Claim.—1. In a machine for hooping barrels, the combination of the revolving eccentrics or cams E and table or carriage F with the hook-nuts *b* on screw-rods B and B', in the manner substantially as and for the purposes described.

2. In a machine for hooping barrels, the combination of the vibrating driving-gear wheel C'', wheel D on shaft *d*, cams E, vertically-reciprocating carriage F, and hook-nuts *b* on rods B and B', constructed and operating substantially as and for the purposes described.

145,943.—Machine for Burnishing Heels, &c.—GARDNER C. HAWKINS, Boston, Mass., assignor to MORRIS & IRELAND, same place. Application filed March 3, 1873.

The cross-head to which the burnishing-tools are attached is arranged to reciprocate upon guides, in a line tangent to the curve of the heel or sole, by means of an adjustable crank, which may be adjusted for any desired length of stroke, also to conform to the rise and fall in the curved edge of the shoe-sole.

Claim.—1. The combination, in a burnishing-machine, of the cross-head H, arranged to move in a guide or guides, and carrying one or more burnishing-tools, the connecting-rod K, and movable crank-pin L', when said crank-pin is so arranged and operated that it may be adjusted to vary the stroke of the burnishing-tool without stopping the machine, substantially as described.

2. In combination with the cross-head H, carrying one or more burnishing-tools, the connecting-rod K, and the adjustable crank-pin L', the vibrating slides E, arranged and operating substantially as described.

3. In combination with the cross-head H, arranged to reciprocate upon a guide or guides, the tool-holder R, consisting of two or more arms radiating from a common center, by which it is secured to the cross-head and adjusted thereon to bring either of said arms into working position, substantially as described.

4. The burnishing-tool H^3, pivoted to its carrier, substantially as set forth, so that it may be vibrated in a direction at right angles to the reciprocating motion, and provided with a spring for controlling the free end thereof, substantially as described.

5. The lever T, controlled by the spring U, or its equivalent, in combination with the cross-head H and a burnishing-tool, substantially as described.

145,944.—Breech-Loading Fire-Arm.—ALEXANDER HENRY, Edinburgh, Scotland. Application filed July 5, 1873.

Claim.—1. The combination of the hammer and the vertically-sliding breech-piece, arranged so that its bottom will, during the descent of said piece, act on the breast of the hammer, or on curved feathers or projections on the hammer, to effect the cocking of the same, substantially as shown and described.

2. The combination, with the sliding breech-piece and the extractor, provided with an inclined plane, as described, of the hammer or tumbler, arranged so that the breech-piece, during its descent, will operate said hammer to cause its outer end to act on the said inclined plane, and so actuate the extractor, substantially as shown and described.

145,945.—Tool for Holding Glass Bottles.—THOMAS B. HEWITT, Williamstown, N. J., assignor of one-half his right to JOHN F. BODINE. Application filed September 4, 1873.

The base of the bottle is placed on the clasping-plate, and held by jaws while the mouth is being formed.

Claim.—The rod F, having on its upper end a plate, E, for seating the bottle, and on its lower end an adjustable nut, I, and bulb H, in combination with the tube D, provided at its lower end with the spring G, and having clasping jaws B B permanently connected with its upper end, substantially in the manner and for the purpose set forth.

145,946.—Washing-Machine.—LEVI HOLDERMAN, New Paris, Ind. Application filed July 11, 1873.

The tub with a curved bottom and rollers, in which a rubber with rollers operates, being pivoted to a rock-shaft and hinged arms, and having a gage-lever.

Claim.—In a washing-machine having a circular bottom and radial dasher, the combination of the hinged arms *b b* with rock-shaft *c* and gage-lever *k*, for the purpose specified.

145,947.—Pitman.—JAMES H. HOLLY and JOHN F. ROBERTSON, Warwick, N. Y. Application filed November 12, 1873.

Claim.—The combination, in a sewing-machine treadle-bar of the bar A, having elongated opening *h*, slot *f*, and recess *d*, with follower *c*, and rod *e*, having nut *g*, all constructed and operating to effect the ready adjustment of the follower *c*, substantially as shown and described.

145,948.—Shirt Button or Stud.—THOMAS J. HOLMES, Malden, Mass. Application filed September 8, 1873.

Claim.—A clamping shirt stud or button, consisting of the screw-shank *a*, the heads *b* and *c* fixed on either end of the shank, and the clamping-disk *e*, constructed, combined, and operating in the manner and for the purpose set forth.

145,949.—Insect-Destroying Attachment for Cultivators.—CHARLES T. HURD, Victoria, Tex. Application filed October 15, 1873.

Attached to the axle of a wheeled vehicle, and extending to the rear, are supports for holding a fan or blower, conjoined with a box for holding poison-powder, operated by a pulley and band running from the axle of the blower to a belt-wheel on the supporting-axle, which forces a current of air charged with powder upon the plants through a lower opening adjoining and parallel to the opening in the blower. Too great a discharge of powder is prevented by an oscillating screen.

Claim.—1. The poison-powder box A, constructed with a lower opening or exit adjoining and parallel to the like opening *r* of the blower B B', in combination with band-pulley A and band-wheel concentric with the supporting-wheels C C of a cultivator or seeder, substantially as described.

2. The combination of the blower B B', having a pulley, *h*, and orifice *r*, with the poison-box A, having an oscillating screen, *b*, and lever *d*, and supported on the braces or arms *k k*, centered upon the supporting-axles of a cultivator or similar machine, substantially as described.

3. In combination with a cultivator, seeder, or similar machine, the poison-blower A B B' *h*, connected to the axles of the machine by means of the adjusting-levers *k k*, substantially as described.

145,950.—Ferrule.—SILAS E. JERALDS, Cheshire, Conn., assignor of one-half his right to EDWIN R. LAWTON. Application filed October 9, 1873.

Claim.—1. A ferrule, in which the edges of the blank are united partly by a lap and partly by a butt weld.

2. A ferrule in which the ends of the joint are formed by lap-welding, while intermediate parts are formed by butt-welding, substantially as and for the purpose set forth.

145,951.—Shutter-Fastener.—PETER KEIFER, Reading, Pa. Application filed October 23, 1873.

A radial arm attached to one of the shutters is pivoted at the bottom, carries at its upper end a flat segmental-shaped bar which is notched or hooked for bowing purposes, and thus forms a turning shutter-bolt.

Claim.—The shutter-fastener, consisting of the radial pivoted arm *a'*, the segmental notched plate A, and the overhanging guide *b'*, operating in combination with the staple C, as herein described.

145,952.—Corn-Planter.—JOSEPH KLAR, Shelbyville, Ill. Application filed October 25, 1873.

The "check-row cord" for operating the seed-valves is prevented, by a guard, pivoted supports, and guides, from being thrown out of gear, and from being choked by corn-stalks or any obstructions in its passage round the pulleys.

Claim.—1. In corn-planters of the description referred to, the guard *a* a^1 a^2, in combination with the pulleys F, pivoted bearings G, and rope V, as specified.

2. The pivoted support G, horn G', and pulley F, in combination with the stationary guide *b*, horns *c d*, and channel b^2, as specified.

145,953.—Wrench.—JOHN LEE, St. Louis, Mo., assignor of two-thirds his right to JOHN J. RICH and JOHN GALLAGHER, same place. Application filed June 7, 1873.

Ratchet-teeth are formed upon the main bar carrying the stationary jaw, and also on an arm rigidly attached to the movable jaw. A forked lever is pivoted to the arm of the movable jaw, and provided with cog-teeth that mesh into corresponding teeth of a sliding wedge passing through and between the movable jaw and main bar, said wedge retaining the movable jaw in position.

Claim.—1. The combination of the parts C and H, having corrugations or ratchet-teeth *c* and *h*, wedge A, having guide-racks *a* on opposite sides of the stem, and forked lever B, all arranged substantially as set forth.

2. The combination of the wedge A, having racks *a* embracing the stem H, and slot E, moving jaw I, projection G carrying the guide and stop pin F, all substantially as and for the purpose set forth.

145,954.—Portable Furnace.—HENRY J. LINGENFELTER, Glen, N. Y. Application filed August 26, 1872.

Claim.—The portable furnace constructed with double walls, with an annular air-space, B, between, ports *a*, for the admission of air to the said air-space, and ports *c*, located in the exit flue D, permitting the heated air to escape in the said exit-flue without coming in contact with the fire in the fire-chamber, substantially as and for the purpose set forth.

145,955.—Cooler for Preserving Beer and Wine.—FRANK LOESCH, Buffalo, N. Y., assignor of one-half his right to GEORGE FISHER, same place. Application filed September 10, 1873.

The beer-receptacles are made with double walls, between which the beer stands. Both walls are in contact with ice.

Claim.—The refrigerator D, having the beer-chambers *f g*, in combination with the beer-barrel C, air-tank A, and force-pump B, all arranged to operate substantially as and for the purpose described.

145,956.—Hoop-Lock Cutter.—JUNIUS G. LOGGINS and PARKHURST P. WILKINS, Williston, Vt. Application filed February 20, 1873.

The hoops are clamped upon an oscillating carrier, which presents them alternately to the cutters, which cut and chamfer the lock.

Claim.—1. The cutter-heads H I, in combination with the swinging hoop, clamp, and carrier, as and for the purpose herein set forth.

2. The swinging frame R, provided with the clamping-jaws T T, plate U, and adjustable gage W, as specified.

3. The combination and arrangement of the supporting-frame with the tapering devices, the devices for chamfering and cutting the lock, and the saw for removing the superfluous material from the ends of the hoops, the different parts being constructed as and for the purposes described.

145,957.—Cuff.—ED. ELISHA MACK, Albany, N. Y. Application filed August 1, 1873.

Claim.—1. A detachable cuff or wristband in which the flap *a* is combined with the central portion A, so as to permit the cuff to be worn in three different positions, substantially as and for the purposes set forth.

2. A detachable cuff or wristband in which the flaps *a* and *a'* are combined with the central portion A, so as to permit the cuff to be worn in four different positions, substantially as and for the purposes set forth.

145,958.—Mop-Head.—DAVID W. MARSTON and JOHN S. SKINNER, Lebanon, N. H. Application filed October 31, 1873.

One jaw for the clamping of a mop is a cross-piece firmly attached to the end of the handle. Parallel to and beyond this is a portion of a wire frame, extending back in a longitudinal loop along the handle, where it is clamped by a screw-bolt passed through the handle.

Claim.—In combination with the handle A and head B, the stirrup C and clamping device E F, all constructed and operating substantially in the manner described.

145,959.—Fifth-Wheel for Vehicles.—JOSEPH R. MCGUIRK, Ansonia, Conn. Application filed June 9, 1873.

Claim.—1. The perch-plate G, having thereon clip F and lugs G, in combination with the circle consisting of sections A and B, in the manner as and for the purpose set forth.

2. The section A of the circle, having thereon a clip, F', in combination with the lower section B, as and for the purpose set forth.

3. The cross-bar J, having studs or fingers *a*, block D, and rub-iron A', provided with a steel face, B', in combination with the clip F and circle consisting of the parts A B, in the manner as and for the purpose specified.

145,960.—Apparatus for Tempering Sickle-Sections. FRANCIS MEYER, Auburn, N. Y., assignor to D. M. OSBORNE & CO., same place. Application filed November 24, 1873.

Claim.—The brick of fire-clay, or other equivalent fire-resisting material, with conical openings *a* in or through it for the direct contact of fire heat to such portions of the blank only as are needed to be tempered, and guides *s* for properly placing the blank over the fire.

145,961.—Indirect Steam-Radiator.—JOHN H. MILLS, Boston, Mass. Application filed October 1, 1873.

Each radiator may be detached from its receiving and discharging connections, and removed from the casing.

Claim.—The combination of a series of independent radiators, each receiving its own supply of steam and discharging its water of condensation independently of the others, with an inclosing air-chamber, and water and steam drums arranged outside of said chamber, and communicating through separate and distinct connections with each independent radiator, substantially as herein shown and described.

145,962.—System of Steam and Water Piping for Buildings.—JOHN H. MILLS, Boston, Mass. Application filed April 19, 1873.

Steam passes through pipe D directly to the highest part of the building, and thence is distributed through the branch pipes I to the radiators, the water of condensation being conducted through the pipes K I to the boiler. Either water or steam may be thrown from the branches *c* or from the upper end of the pipe D.

Claim.—1. The herein-described mode of steam-heating, by conducting the steam from the boiler directly and without distribution to or above the highest point of the building, and thence supplying it downward to the heating devices in the different stories of the building to be heated, substantially in the manner shown and set forth.

2. A system of steam-heating, comprising the combination of supply-piping conveying the whole of the steam without distribution to the highest point of the building to be heated with branch piping conveying downward from such highest point to the steam-supply to the different radiators or coils, said branch piping serving at one and at the same time to supply steam to and conduct the water of condensation from the radiators or coils, substantially as herein shown and described.

3. The combination, with the main supply-piping and return branch piping of a steam-heating system, organized and operating as herein described, of a water-service pipe and system of valves, whereby said main piping can, when occasion demands, be isolated completely from the boiler and branch piping and thrown into communication with the water-service pipe, substantially as and for the purposes shown and set forth.

4. The combination, with the main supply-piping and return branch piping, and radiators connected therewith, operating together, as described, of an air vent or valve, located on the return branch piping at a point between the first or lowest radiator and the water-line of the boiler, and constituting the vent for the air driven forward through the piping, and from the several radiators, by the advancing steam, as shown and set forth.

145,963.—Spring-Shank for Boots and Shoes.—WILSON J. NEILL, Lawrence, Kans., assignor of one-half his right to ROBERT D. MASON, same place. Application filed April 21, 1873.

Claim.—A spring-shank for boots and shoes, when made wide at the front point and slotted, for the purposes set forth.

145,964.—Valve.—JOHN A. NICHOLS, Pittsburg, Pa. Application filed October 25, 1873.

The body of the valve-seat is grooved to receive an elastic valve, and perforated within said groove by openings for the passage of the fluid. The rubber strip is held in position by clamps, and operates by its own elasticity.

Claim.—1. The shell *a*, having a series of openings, *d*, in the groove *b*, covered by an elastic strip, *e*, which operates to open and close them, as described.

2. The within-described valve, in combination with the cylinder *i* and receiving and discharging openings of a pump or engine.

3. The shell *a*, having longitudinal ribs, so that in grooving, as at *b*, to form the seat for the strip *c*, the shell may be cut through between them, thereby forming the openings *d*.

145,965.—Vehicle.—BENJAMIN PARMITER and WILLIAM BRADLEY, Morgan county, Ohio. Application filed April 25, 1872.

Claim.—The frame B, side springs C C, and cross-spring D, in combination with the slotted rigid bars I I and cross-bar K, as set forth.

145,966.—Stump-Extractor.—FREDERIC PLANT, Bricksburg, N. J. Application filed April 11, 1871.

To the frame is attached a hoisting apparatus, consisting of shafts, bevel-wheels, worm and worm-wheel, and pulleys, operated by a crank and windlass. Transportation is facilitated by wheel resting on the ground, attached to frame by bent lever or

arm, to which is pivoted another lever, which raises one foot of the frame from the ground and supplies its place with said wheel.

Claim.—1. The combination of the frame *a a b*, barrel *f*, chain *g*, screw *k*, wheel *m*, bevel-wheels *n o*, and shafts *p l c*, substantially as and for the purpose herein specified.

2. In combination with the stump-extractor herein described, the wheel *x*, controlled by means of the bent lever or arm *v* and lever *y*, substantially as herein specified.

145,967.—Truck.—HIRAM PRATT and THOMAS T. MUNHALL, Fairbury, Ill. Application filed July 21, 1873.

Claim.—In a double-clutch hand-truck, the two longitudinal bars *d d*, the sliding staple *g*, pivot-pin *i*, with its catch *k*, the S-shaped double-pointed hook *b c*, with its spring arm *l* hooked to the sliding ring *f* on the bars *d d*, pivoted by pin *p* to and between the double hook *a a*, all combined to operate in connection with the truck-head *m*, as described.

145,968.—Refrigerator for Slaughter-Houses.—HENRY A. ROBERTS, Boston, Mass. Application filed May 10, 1873.

The ice-chamber has a non-contact condensing-plate on one side, and cleats for preventing the ice pressing against the wall on the other side. Vanes are placed along an opening at the foot of the inclined floor to direct the current of air, part of which enters a chamber with an inclined ceiling provided with a flue, and the other part into a higher chamber also provided with a flue. Air also circulates around an auxiliary chamber for salting purposes.

Claim.—1. The ice-chamber *f*, having the floor or other support for the ice inclined downward toward a partition-wall, at the upper and lower portions of which wall are placed, respectively, an induction and eduction air-passage.

2. The arrangement, with the ice-chamber *f* of the non-contact condensing-plate *h*, said plate being constructed and arranged substantially as above described, for the purpose of allowing free circulation above, below, and on each side of the same, so that the condensed moisture may adhere to both surfaces of the said plate.

3. The arrangement, with my ice-chamber *f* and floor *g*, of the ribs or cleats *j j*, or their equivalent, for the purpose of exposing more ice-surface to the descending current of air, as above specified.

4. The arrangement of the auxiliary chamber *c* with the flue *d*, said flue being of any desired length, and leading from the apex of the inclined roof *c''* to the ice-chamber *f*, for the purposes described.

5. The arrangement of the ice-chamber *f* and flue *d*, of any desired length, with the tank or chamber *n*, having air-spaces *n' o* around and below it, as and for the purposes above set forth, and particularly for the purpose of preventing any stagnation of air in the portion of the chamber *c* which is nearest the tank *n*.

6. The drip-vanes *m' m*, the lower edge of the former projecting beyond the lower edge of the latter, and arranged so as not only to discharge the drippings into a receptacle below, but also to facilitate the passage of the descending current of cool air, as herein before specified.

7. The arrangement, with the chamber *a*, of the plate or wall *b*, as and for the purpose above described.

8. The arrangement, with the high conditioning-chamber *a*, of the lower auxiliary chamber *c*, said chamber *c* being constructed either with or without the inclined roof *c''*, to facilitate the passage of air into the flue *d*, as and for the purposes hereinbefore described.

9. The arrangement, with the chambers *a c*, or with either, of the chamber or tank *n*, said tank *n* having air-spaces *n' o* around and below it, constructed and arranged substantially as and for the purposes hereinbefore set forth.

145,969.—Injector.—SAMUEL RUE, Philadelphia, Pa. Application filed December 9, 1873.

Claim.—1. In an injector, the delivery-tube and the combining-tube, having a telescopic connection, substantially as and for the purpose set forth.

2. The combining-tube H, with the delivery-tube D' projecting therein to, and the space k between the tubes, in combination with the overflow and the water and steam supply, substantially as and for the purpose set forth.

145,970.—Windmill.—EMILIUS SANDERSON, Paris, France. Application filed March 29, 1873.

Two semicircular flat surfaces arranged at nearly right angles to each other are attached to a shaft, so as to form with said shaft angles of about forty-five degrees.

Claim.—The peculiar construction of the said apparatus, as and for the purposes hereinbefore described, it being a windmill consisting of two semicircular or semi-oval flat surfaces fastened on a horizontal shaft, so as to be about at right angles between themselves, being fastened to said shaft by the middle of the lines that are to be considered as the chords of the arcs of the semicircles, said surfaces forming angles of about forty-five degrees with said shaft, that revolves in two chairs.

145,971.—Process for Cleaning Marble, Granite, &c.—JOSHUA SAWYER, Northfield, Vt. Application filed August 8, 1873.

Claim.—The process of cleaning marble, granite, and other stones by washing the stone to be cleaned in muriatic and oxalic acids mixed in water, while the stone is wet with sal-soda, substantially as described and set forth.

145,972.—Fastening for Meeting Rails of Sashes.—JOHN D. SHEWELL, Boston, Mass. Application filed November 15, 1873.

The downwardly-projecting part of the lever is chambered and provided with a locking-bolt actuated by a spring, and having a locking-dog or projection, forming a bayonet-fastening.

Claim.—The locking-bolt G, provided with the projection or dog M, adapted to lock it in two positions, in combination with the lever C, spring H, casing I, shoulder N, and plate E, substantially as and for the purposes specified.

145,973.—Hinge for Safe-Doors, &c.—WILLIAM F. STEVENS, Melrose, Mass. Application filed July 23, 1873.

Claim.—The removable hinge-pin *g* arranged in the tubular socket *e*, projecting from the outer side of the door, and fastened in said socket by screws *h h* inserted from the inner side of the door, in combination with the pivot *a* on the door and the steps *d* and *c* in the door-frame, all arranged as shown and described.

145,974.—Shirt-Collar Fastening.—GEORGE STRASZKS, Manchester, Mo., assignor of one-half his right to HECTOR MCNEILL, same place. Application filed December 1, 1873.

Claim.—The collar-fastener, consisting of the plate A, pin B, turn stud or button D, and keeper C, having a slot, *c*, all arranged substantially as and for the purpose set forth.

145,975.—Nail-Extracter.—GEORGE C. TAFT, Worcester, Mass. Application filed April 14, 1873.

The nipper-points are socketed in the lever-arms, having shoulders to bear against.

Claim.—The shaft *a*, provided with the ram 3, in combination with the removable nippers *g g'*, provided with the shoulders *d*, substantially as and for the uses and purposes shown and described.

145,976.—Apparatus for Condensing and Collecting White Zinc.—CHARLES W. TROTTER, Brooklyn, N. Y., administrator of JONATHAN G. TROTTER, deceased. Application filed December 5, 1873.

In the front end of the building is a receiving-chamber into which the zinc vapor is discharged, through a perforated pipe, at or near the roof, and strikes a deflector. In the receiving-chamber the air-pipes discharge downward, cooling the vapor and assisting the deposit of foreign matter. In the second chamber branch pipes discharge the blast upward to assist the oxidation of the vapor.

Claim.—1. In combination with the chamber C, the atmospheric air-pipes G H I and branch pipes K, substantially as set forth.

2. In combination with the flues or passage-ways F and walls L, the series of transverse air-discharging pipe M and supply-pipe N, arranged and operating substantially as described.

145,977.—Combined Nubia and Veil.—JOHN W. TUTTLE, Watertown, Mass. Application filed October 31, 1873.

Claim.—As a new manufacture, the knit scarf or nubia A, made or provided with the veil B projecting from one edge of it, the two being lapped upon each other, and connected and gathered at their next adjacent ends, all substantially as shown and described.

145,978.—Needle-Threading Hook.—HENRY WELLS, Woburn, assignor of one-half his right to DANIEL FOBES, Cambridge, Mass. Application filed September 10, 1873.

Claim.—1. As a new article of manufacture, the needle-threading device having hook *a* at one end, with the notch *b* at the other end, substantially as described.

2. A hook for threading needles cut from a notched strip of flattened wire, for the purposes set forth, and substantially in the manner above specified.

145,979.—Cranberry-Picker.—JOSEPH WESTON, Duxbury, Mass. Application filed October 22, 1873.

A cranberry-picker having inclined curved bottom teeth, with intermediate and side guards, the sides being provided with teeth of varying length upon the under side of a cover, and to it is attached a brush which meshes with the bottom teeth in the operation of gathering berries. In rear of the box proper is attached a receptacle for holding berries, provided with a door which admits them from the picker.

Claim.—1. A device for picking cranberries, formed with a back or frame, A, hinged lid E, brush G, teeth *a*, guards C and D, and side teeth *b*, all constructed and combined substantially as specified.

2. In combination with the subject-matter of the foregoing claim, the receptacle I, having a hinged flap, B, trap J, and jointed cover L, substantially as described, for the purpose specified.

145,980.—Rotary Winnower.—JAMES H. ADAMSON, San Francisco, Cal. Application filed September 23, 1873.

A truncated cone-shaped blower-casing, with spiral wings fixed to its inner periphery, is placed concentrically within a rotating cylindrical screen, the meshes of which are increased or diminished by cams for each wire ring, placed on the frame rods or wires of the screen.

Claim.—1. The wires D, in combination with the cams *e*, for the purpose of changing the size of the meshes of the cylinder, as set forth.

2. The eccentrics or cams *e*, mounted upon the bars F, and the pinions I and gear-wheel J, for the purpose of simultaneously adjusting the rings D to make the proper mesh, substantially as herein described.

3. The cone-shaped casing I, concentrically arranged within the cylinder, in combination with the large end blades R, for the purpose of creating a diverging blast, as set forth.

4. A grain-cleaner consisting of the rotary cylinder, composed of the adjustable rings D, with their eccentrics *e*, and their operating devices, as shown, in combination with the propeller-blower, mounted within the cylinder, substantially as and for the purpose herein described.

145,981.—Steam Cooker.—JOHN BENTZ, Parkersburg, W. Va. Application filed November 15, 1873.

The steam enters through short tubes, with valves applied thereon, the valves opening to admit steam on closing the drawers, and shutting off the steam on opening the drawers.

Claim.—1. The steam cooker arranged with partitions above boiler B, and boiler-extension C along rear side, with tubes *e* and valves *f*, substantially as described.

2. Drawers D, having tubes A, and rods *g* for opening and closing valves *f*, as set forth.

145,982.—Filling for Decayed Teeth.—CHARLES E. BLAKE, San Francisco, Cal. Application filed December 6, 1873.

Claim.—The alloy of platinum and gold for the purpose of providing an improved dental gold, substantially as above specified.

145,983.—Draft-Equalizer.—ELIAS H. BLAKE, Coatsburg, Ill. Application filed October 25, 1873.

Claim.—The combination, with the tongue A and triple-tree G, of the detachable triangular frame D, having its forward side slotted, the plate F, and the clamps E E, all as shown and described.

145,984.—Stock-Feeder.—ULYSES BOREL, Sue City, Mo. Application filed September 27, 1873.

The openings in the sides of the barn have doors, which, when opened, serve as extensions to the feed-racks.

Claim.—In combination with the stock-inclosure A, provided with feed-openings, the racks B and doors E, the latter being attached by staples and links, as shown and described, whereby they are adapted to be supported upon the racks, when open, as and for the purpose specified.

145,985.—Churn-Dasher.—DAVID BOYD, Vevay, Ind. Application filed August 25, 1873.

A churn-dasher, working vertically, with reversely-beveled cross-bars and rim, with one pair of faces inclined outwardly and the other inwardly.

Claim.—The rim D, with one opposite pair of faces inclined outwardly and the other pair inwardly, combined with the cross-bars B C, each reversely beveled on its opposite ends, as and for the purpose described.

145,986.—Wagon Hay-Press.—HERMAN BROCKSMITH, St. Louis, Mo. Application filed March 25, 1873.

A coiled spring is arranged in connection with a train of gear-wheels to return the follower after the completion of the bale. A frame-work is also arranged in the bottom of the press-box, in such a manner that, when the follower is withdrawn, a hook attached thereto engages with such frame-work and raises it, thereby releasing the bale from the press-box.

Claim.—1. In combination with the follower B and toggle-joints C C' c^1 c^2 and rack-bars, the coiled spring I, arranged as shown and described, to return the follower, as and for the purpose specified.

2. The combination of the follower B, having hook *b'*, with the draw-frame L, as described, for the purpose set forth.

3. In combination with the pivoted door J, having the weight *k*, the detent-hooks *j*, springs *j'*, and lever C, as described.

145,987.—Water-Wheel.—MOSES CHANDLER, East Corinth, Me. Application filed August 20, 1873.

A supplemental bottom is secured to the under side of the bucket, converging toward the preceding one, making, when the parts are taken together, the wedge-shape reaction-bucket, thus acting either as a percussion or reaction wheel. A series of rolling gates are employed to regulate the quantity of water admitted to the wheel.

Claim.—1. A horizontal water-wheel having, in combination with percussion-buckets *a*, supplemental bottoms *b'*, forming together reaction-buckets B, as herein set forth.

2. In combination with said wheel A, as above described, the rolling gates *c c* with their links *h* and disk *i*, arranged to operate as set forth.

145,988.—Sash-Holder.—SAMUEL CHARD, Mianus, Conn. Application filed November 8, 1873.

A spring-catch having a half-circular serrated face-plate is attached to a slotted bed-plate by a movable knob-pivot, which slides back and forth in the slot therein. This catch or holder is held against the jamb by pressure of the spring, and, being free to turn on its knob-pivot, acts as an eccentric to hold the sash securely in desired position.

Claim.—The knob-pivot F, springs I, and slotted plate D, in combination with an eccentrically-acting sash-holder, arranged substantially as set forth, for the purposes described.

145,989.—Damper for Stoves.—EDWARD F. COOK, Omaha, Neb. Application filed August 30, 1873.

An elastic ring attached to the damper serves to hold it in any desired position.

Claim.—The combination, with the damper B, of an elastic band or hook having a greater radius or diameter than said damper, as shown and described, to operate as specified.

145,990.—Pin for Jewelry Ornaments.—JOHN P. COURTNEY, Brooklyn, N. Y. Application filed November 17, 1873.

Claim.—1. The screw-eye for the pin of an ornament, made of a folded piece of sheet metal, with a stop, 6, for the pin, and a screw-shank formed of the wings 5 5, as and for the purposes specified.

2. The pin *a* with a T-head and point, in combination with the screw-eye made of sheet-metal, with a mortise for the pin, and a stop, 6, substantially as set forth.

145,991.—Railway-Tie.—HENRY L. DE ZENG, Geneva, N. Y. Application filed June 3, 1873.

Claim.—The wrought-metal cross-tie, with the lips *i* for the flange of the rail, in combination with the flange-clips *o* and keys *r*, substantially as and for the purposes set forth.

145,992.—Compound Tool.—JOHN DILLON, New York, N. Y. Application filed December 1, 1873.

A hammer having a hollow handle and an extension-piece for the purpose of a wrench, and to hold a gimlet and screw-driver or brad-awl.

Claim.—An improved compound tool formed of the hammer-head A, provided with the claws B and the socket K, the handle C, provided with a square socket, D, the handle E, provided with the jaws J, the gimlet F, brad-awl G, and disk H, and the set-screw I, constructed and operating in connection with each other, substantially as herein shown and described.

145,993.—Scroll-Sawing Machine.—THOMAS W. DOWLING, Pontiac, Mich. Application filed May 14, 1873.

The tension-springs, together with the saw-guides, are secured to a peculiarly-formed metal base, which is adjustably attached to a perpendicular standard.

Claim.—The combination of the casting A, constructed as shown, the adjustable springs J J, pivoted arms I I, strap D, gage H, block E, guide G, and set-screw *a*, all constructed to operate substantially as and for the purposes set forth.

145,994.—Spring for the Seats of Vehicles.—CONRAD DUECKER, Lively Grove, Ill. Application filed October 4, 1873.

Claim.—In combination with the seat B, the circular or bow springs C, having hooks E, and applied to the ends of the seat, as and for the purposes shown and described.

145,995.—Tubular Fire-Bar and Connecting-Bearing.—ROBERT J. ELLIS, Liverpool, England. Application filed September 20, 1873.

The water enters and returns to the front, where it is led to the boiler from bearings provided for that purpose, circulation being always kept up through all the fire-bars, the temperature being the same as in the boiler, irregular contraction and expansion being obviated.

Claim.—The tubular fire-bar and connecting-bearing, constructed, respectively, as herein described, and arranged in relation to each other as set forth, for the purpose specified.

145,996.—Fence-Machine.—JOHN H. EVANS, Dallas, Ky. Application filed April 26, 1873.

Posts have the mortises cut in them, and the ends of the rails tenoned and formed to correspond with the mortises.

Claim.—1. The combination, with the vertically-moving carriage D, of the boring implements A and planing implement C, all constructed and operating substantially as specified.

2. The bifurcated tapering implement N, provided with the knives O O, hinged to the frame, and arranged and combined for operation substantially as specified.

145,997.—Telegraph-Insulator.—CHRISTIAN FOX and ELISHA G. HESTON, Gap, Pa. Application filed August 20, 1873.

An annular glass insulator, slotted in its upper face for the wire, fits over a stud and rests upon a shoulder on the supporting-bar. A shed-cap screws down upon the stud.

Claim.—The combination of the nut-like cap C with its sheltering base to cover, clamp, and protect the annular slotted insulator G B, when the latter rests upon the shoulder *a*, and the former receives the screw end D of a vertical shaft or support, A, the whole arranged in the manner shown, for the purpose set forth.

145,998.—Breech-Loading Fire-Arm.—GUNDER GUNDERSEN, Chicago, Ill. Application filed August 5, 1873.

Devices for locking the barrels in place, and for relieving the joint or hinge of sudden and undue strains.

Claim.—1. In a breech-loading gun, the catch C, pivoted to the projecting end of the upper rib, arranged between the tilting barrels, substantially as and for the purpose specified.

2. The lever O, arranged below a tilting barrel in a breech-loading gun, and provided with the spring O', in combination with the breech-piece D, provided with the spur *o*, arranged to support the said spring, substantially as and for the purpose specified.

145,999.—Oil-Can.—WILLIAM R. HALLOCK, Westfield, N. J., assignor to himself and PIERSON & MOREHOUSE, same place.

Application filed November 15, 1873.

When oil is to be drawn from the can, the flexible tube is pulled off the vent-tube and the unconnected end placed in the vessel to be filled. When the can is filled for transport, a plug is put into the opening in the movable cap of the can and a screw-plug in the vent-tube.

Claim.—The flexible tube, connected at one end to the oil-can, in combination with the vent or air-tube of the can, that is closed by the movable end of such flexible tube, substantially as set forth.

146,000.—Sewing-Machine Attachment for Making Button-Holes.—JOHN F. HASKINS, Fitchburg, Mass. Application filed September 11, 1873.

Improvement on patent No. 103,745. The looper that brings the shuttle-thread over the edge is rotated partially to place the loop of thread carried by it, so that the vibrating finger, which carries such loop under the needle, can catch but one portion of it. By jointing the frame the attachment may at all times form part of the machine, and be turned into or out of working position.

Claim.—1. The improved looper, having an eye in which it receives the needle and retains the thread, and having a motion on its axis in addition to its reciprocating motion, as specified.

2. The finger E, in combination with the pin *y* and cam, substantially as described.

3. The compound bed-plate, made in two parts, C and D, combined together substantially as described.

4. The compound thread-catcher and its actuating mechanism, the finger E and its actuating mechanism, and the compound bed-plate C D, all combined together substantially as described.

146,001.—Manufacture of Gold-Leaf for Book-Binders' Use.—ROBERT EDGAR HASTINGS, Philadelphia, Pa. Application filed November 25, 1873.

Claim.—The manufacture of gold-leaf for book-binders' use from ribbons composed of an interior metal of silver or its alloys with copper, and an exterior metal of gold or its alloys with silver or copper, the whole united together by welding or solder.

146,002.—Portable Elevator and Dumper.—WILLIAM H. HERRIOTT, Brimfield, Ill. Application filed December 3, 1873.

The platform has an inclined approach for wagons at either end, with a "trap"-covered box for shooting a load into from a wagon whose trap is on a level with the platform. The box is hoisted by pulleys and double ropes running through pulleys at the top of the frame, and thence down to a windlass or roller beneath the platform operated by a drum or capstan and rope, and having a lever to which horse or other power is attached. The side of the elevating-box opens, on attaining a sufficient height, by a spring-lever on said side, which strikes a pin in the frame and withdraws the catch of said side or door, and discharges the contents into a "two-way" spout, which dumps the grain on either side of the platform, as desired. The door is closed by the striking of segmental cleats thereon against the edge of the spout during the descent of the box.

Claim.—1. A portable elevator and dumper, composed of platform F, wagon-approaches G G, an elevating-box, J, hoisting-ropes o o passing over pulleys in the frame B C D E above, windlass K, and spout F F, substantially as and for the purposes described.

2. In combination with platform G, the hoister H, with its guides *p p*, lever *n*, and connected lever I, substantially as described.

3. The box J, constructed with side guides *u u*, pulleys *t t*, inclined bottom *f*, falling flap *w* with curved cleats or ribs *g*, spring detent *h s k*, the lever *k* for contact with the pin *l* of post D to loose the detent, as described.

4. The construction and arrangement of the frame A A B B C C D D E E, &c., platform G G, hoisting-frame H, lever *n*, and its auxiliary lever I, box J, with flap *w*, detent *h s k*, pin *l* on post C, ropes *o o*, windlass K, and spout F F, as described.

146,003.—Mole-Trap.—ROBERT I. HUGGINS, Bethel, Ohio. Application filed November 1, 1873.

To a platform, to be raised by the animal over whose path it is set, is attached an upright rod, cut off bias at the top. This bias portion bears against one side of a pivoted button whose other end holds up the weighted fall.

Claim.—1. A mole-trap constructed substantially as shown and described—that is, having sill or foundation pieces A A, uprights C C, notched falling rod and cross-head E F, cross-piece J, tripping rod K, and button-lever L, all arranged to operate substantially as shown and described.

2. The notch M, button-lever L, and rod K, in combination, as and for the purposes described.

146,004.—Combination-Plane.—ANDREW JOHNSON, San Francisco, Cal. Application filed November 15, 1873.

The guide-bars and plates are made flexible to conform to curved surfaces.

Claim.—1. The plates B, having elastic adjustable curving strip *c*, combined with the block A and adjusting-standards I, substantially as and for the purpose described.

2. The combination of the elastic gage-plate F, bar H, and slotted links V with their set-screws.

3. In combination with the elastic adjustable gage-plate F, the vertically-sliding post J with its holding-screw, and the bar L with its horizontally-adjusting screws M, and the nuts N, substantially as and for the purpose herein described.

4. The adjustable curved plates *e e'*, in combination with plate B and intermediate blocks Q, substantially as and for the purpose set forth.

146,005.—Gathering and Ruffling Attachment for Sewing-Machines.—ALLEN JOHNSTON, Ottumwa, Iowa. Application filed December 18, 1873.

The gathering-blade drops on the cloth, moves it forward, rises from it, and retreats; it is provided on its upper side with a shoulder, and an adjustable strip between, which moves a pusher-bar operated by a bell-crank lever.

Claim.—1. The gathering-bar supported in guides in the frame between an elevating-spring below, and a reciprocating pusher-bar above, said pusher-bar being constructed and operating at the times and in the manner stated, to depress and to permit the elevation of the gathering-blade, and to reciprocate it longitudinally, substantially as and for the purposes shown and described.

2. In combination with the gathering-bar, the pusher-bar resting on said gathering-bar between shoulders thereon, connected with the vibratory angle lever, so as to be reciprocated by the same, and formed with a reduced part and an incline to operate in connection with a pin on the main frame of the attachment, substantially as and for the purposes shown and set forth.

3. The combination, with the reciprocating pusher-bar, the elevating-spring, and the gathering-bar, arranged and operating together as described, of friction-springs or pads on the sides of the gathering-bar, adapted to bear against the guides between which the gathering-bar moves, as and for the purposes shown and set forth.

4. In combination, the lower holding-blade, the upper gathering-blade, the pusher-bar, and elevating-spring for giving an up-and-down and back-and-forth movement to the gathering-blade, and the cam, or its specified equivalent, for regulating the length of movement of the gathering-blade, said parts being constructed and arranged together in the attachment for operation, as shown and described.

146,006.—Burglar-Alarm.—JAMES J. KANE, Brooklyn, N. Y. Application filed August 29, 1873.

Pulling or cutting a wire moves a lever which trips a spring-barrel, actuating an alarm, and the stud by which the barrel was retained revolves against and trips a trigger which snaps a cap to ignite a fuse which lights a lamp.

Claim.—The combination of the spring-drum K, catch-stud J, lever L, the swinging pawl W Z, lever *b*, hammer R, and spring V, as shown and described, to operate as specified.

146,007.—Sausage-Cutter.—JACOB KNOPF, Columbiana, Ohio. Application filed August 2, 1873.

The cutters travel in grooves in the case, and operate with three zigzag rows of abutments, by means of which the meat is made to cross the box laterally several times, which subjects it longer to the action of the cutters.

Claim.—The cutters D traveling in grooves C, in combination with the abutments *e*, *f*, and *g*, arranged and operating, with relation to the cutters, substantially as herein described, and for the purpose set forth.

146,008.—Car-Coupling.—THOMAS REAS LAND, Grass Valley, Cal. Application filed June 3, 1871.

As the arrow-head of the link is pushed through the block B it turns it until its slot is parallel with that in the draw-head, and when its head has passed beyond the block the weighted lever C returns it to position. A plunger, having a socket corresponding in shape to that of the link-head, serves at the same time as a buffer and to prevent the link from turning when it is forced into an opposing draw-head.

Claim.—The combination of the spear-headed shackle-bar A, socket-piece F, having a rectangular stem block, G, with corresponding aperture, springs H, block B, having a spiral opening and weighted lever C, as shown and described, for the purpose specified.

146,009.—Propulsion of Vessels.—CHARLES P. MACOWITZKY, Corpus Christi, Tex. Application filed August 23, 1873.

Claim.—The combination of the sleave or socket H, made smooth upon one end and threaded upon the other, and the square rod I, with the arms B F, the sliding frame or plate G, the rack-bar C, gear-wheels or segments D, and pivoted paddles E, substantially as herein shown and described, and for the purpose set forth.

146,010.—Rotary Engine.—WILLIAM R. MANLEY, New York, N. Y. Application filed April 23, 1873.

By the eccentric arrangement of the packing-rings the wear is distributed over a broad annular space, and the lubricating material is carried laterally between the wearing-surfaces. The pistons are forced outward radially by means of fluid admitted through hollow hub and shaft. If the pressure in the cylinder is greater than that in the hollow hub, the valves open and permit the fluid to enter said hub and assist in holding the pistons.

Claim.—1. The combination, substantially as before set forth, of the revolving piston, the fixed cylinder, and the heads of the cylinder revolving with the piston, and arranged to embrace the cylinder between their adjacent faces.

2. The combination, substantially as before set forth, of the revolving piston, the fixed cylinder, the cylinder-heads revolving with the piston, and the packing-rings arranged eccentrically to the centers of the cylinder-heads.

3. The combination, substantially as before set forth, of the revolving piston, the hollow piston-hub, the revolving cylinder-heads, the fixed cylinder, and the valves for supplying the hollow piston-hub with fluid from the cylinder.

4. The combination, substantially as before set forth, of the revolving piston, the hollow piston-hub, the revolving cylinder-heads, the fixed cylinder, and the passage through the gudgeon of the piston-hub, for supplying fluid thereto from the exterior of the engine.

5. The combination, substantially as before set forth, of the revolving piston, the hollow piston-hub, the revolving cylinder-heads, the fixed cylinder, and the nipple for holding the piston to the surface of the cylinder.

146,011.—Draft-Equalizer.—WILLIAM MCCLELLAND, Sr., Fowler, Ill. Application filed August 16, 1873.

Claim.—1. The combination of a pivoted bar, D, bar C, and adjustable screw-rod C', having a fixed point of connection with the hounds, whereby the bar E may be adjusted to equalize the draft, as set forth.

2. The curved and screw-threaded rod C', in combination with the lugs *f* of rear supporting-bar C, and the cross-bar B, having holes *d*, to provide for adjustment of the angle of bar D, and form a rigid connection between it and the bar B, as specified.

146,012.—Treating Animal Fats.—HIPPOLYTE MÈGE, Paris, France. Application filed November 1, 1873.

All the tissues are removed; the fat melted at a low temperature after treatment with pepsin and cow's udder. The oleomargarine is separated from the stearine.

Claim.—1. The improved material herein described produced of treating animal fats so as to remove the tissues and other portions named, with or without the addition of substances to change the flavor, consistency, or color, as set forth.

2. The process herein described of treating animal fats in the production of oleomargarine.

146,013.—Lubricating Journal-Boxes.—JEAN MORIN, New York, N. Y. Application filed November 22, 1873.

The outer surrounding case has a detachable cap-piece and bearing for the shaft. The central and side recesses connect by base channels, with the oil-chamber at both sides of the outer case, feeding the oil by the wicks to the shaft.

Claim.—1. The self-lubricating journal-box, consisting of case A, with oil-chambers B, and wick-channels *d*, bearing C, central and side wicks F, and cap piece G, and connected substantially as and for the purpose described.

2. The surrounding case A, having flat, central, and lateral base channels *b*, for establishing the connection of oil-chambers B and wick-channels *d*, and provided with a supply-tube, *a*, in the manner and for the purpose described.

3. The axle-bearing C, having side recesses *d*, for the wicks and downwardly-extending wick-tube *e*, as set forth.

146,014.—Eaves-Trough Support.—THORNTON F. MORRISON, Findley, Ohio. Application filed July 5, 1873.

An eaves-trough support in which the cross-ties are made triangular in section, with a slot in the center for the reception of the hanger C. The hanger is composed of two pieces of metal, and when passed through the slot in the cross-tie the ends are turned in opposite directions. It is attached to the roof-bracket D in a similar manner.

Claim.—An eaves-trough hanger, C, having hooks E and clamps H H, the tie B, triangular in cross section, and the bracket D, slotted at F, combined as and for the purpose described.

146,015.—Farm-Gate.—DAVID A. NEIDIG, Paris, Ohio. Application filed August 9, 1873.

A gate which may be opened for a foot-passenger or bridle-path or for a carriage-way. It glides open by a midway inclined bar moving obliquely upward on a pulley on the right-hand post. An upper pulley on the gate at the same time lifts the right end of a bar which guides the gate as it gravitates to a closed position.

Claim.—The combination of supporting-rail B and inclined rail D, each sliding on a pulley, with main post C and auxiliary posts E E' E², as and for the purpose described.

146,016.—Carpet-Sweeper.—HARTWELL A. PALMER, Hingham, and ALBERT H. SPENCER, Boston, assignors to JOHN J. HALEY, Newton, and HENRY C. MORSE, Boston, Mass. Application filed October 23, 1873.

The spindle of the brush is received in an open bearing, and held in place by a spring which presses against said spindle. A strip of rubber is placed between the case and its cover, and projects from the top edge of the case, and serves as a buffer, and also prevents the escape of dust from the case.

Claim.—1. The combination of a carpet-sweeper brush with its bearing and a spring, substantially as described.

2. The combination of a strip of rubber packing, or other similar material, with the case and cover of a carpet-sweeper, as and for the double purpose specified.

146,017.—Saw-Filing Machine.—WALTER W. PARSONS, Stanstead, Canada. Application filed July 19, 1873.

A file-stock supported by a rocking frame, operated by a cam, so as to lift the file while the saw is moving forward to bring a new tooth under the operation of the file.

Claim.—The combination, with filer-stock sliding frame B, of the cam Z, rocking lift-plate M, and pawl and ratchet V W, operated at the times, in the manner, and for the purpose specified.

146,018.—Valvular Stopper for Bottles.—CALLENDER PATTERSON, Philadelphia, Pa. Application filed October 11, 1873.

A tube, open at the two opposite sides, is fitted to slide within the neck of a bottle, and is supported by a surrounding spiral spring, and held open by an elastic catch engaging on the lip of the bottle.

Claim.—1. The combination, with the throat and mouth of a bottle, of the tube A, with its attachments *a'*, C, 2, 3, and D, when the said tube and its attachments are constructed, arranged, and applied to operate as and for the purposes hereinbefore set forth and described.

2. The spring-catch E, in combination with the upper end of the tube A, the said spring-catch being constructed and arranged to operate substantially as and for the purposes hereinbefore set forth and described.

146,019.—Wood Pavement.—EDWIN W. PERRIN, Portland, Oreg. Application filed October 31, 1873.

A pavement formed of wood blocks channeled on the top for the reception of a filling material, and united by iron rods passing through the blocks horizontally.

Claim.—A pavement composed of the blocks A, channeled at B, and beveled, as at *d*, when united by the rods C extending through them, the whole being constructed substantially as and for the purpose herein described.

146,020.—Can for Transporting Oil, &c.—JAMES E. PIDLEY, Newark, N. J. Application filed November 15, 1873.

The cap is secured to the nozzle by cement introduced into a groove in the cap, and the can is held in the case by a metal strip across its top.

Claim.—1. The cover of the packing-case constructed to rest on two sides of the part A, and project down along and overlap the other sides, to be fastened detachably by nails or screws, in the manner described.

2. The tapered nozzle H and cap I, in combination, when arranged to be sealed by cement, in the manner described.

3. The vent surrounded with a funnel, K, for sealing it with cement, as described.

146,021.—Sewing-Machine.—DAVID R. PRATT, Greenfield, Ohio. Application filed June 17, 1873.

A vertically adjustable and oscillating saw-guide is placed between upright standards in such a position as to guide one end of the saw while the other is directed by the hand of the operator.

Claim.—The combination of the saw, sleeve, pivot-bar, and standards, substantially as shown and described.

146,022.—Wash-Roller.—HUGH ROSS, Plattsburg, N. Y. Application filed July 5, 1873.

A false bottom, consisting of two sections hinged together, and flanged and partitioned on the under side, make separate water-chambers below. Hinged to this bottom, at its ends, are vertical fountain-chambers. Valves, caged below and protected above by perforated coverings, give downward water-passage. Vertical partitions in the fountain-chambers narrow the upward water-passages and give force to the jet. A small perforated vessel to hold washing-chemicals connects with the false bottom by a short tube. Within it a ball-valve lets water in from below and forbids its return.

Claim.—1. In combination with a common boiler, the separate steam washer, consisting of hinged bottom A, with valves D, perforated coverings C, cages E, and hinged side chambers B, substantially as and for the purpose described.

2. The hinged bottom A, having central partition *d* and apertures *f m*, and slides *m'*, as set forth.

3. The side chamber B, consisting of hot-water passages F, with partitions *h*, and air-chamber G, as described.

4. The receptacle H, for acids or other chemical ingredients, having tube *n*, with ball-valve *p*, and perforated sides and bottom *q*, constructed substantially as specified.

146,023.—Wood-Screw.—ISAAC S. RUSSELL, New Market, Md., assignor of one-half his right to HENRY R. RUSSELL, Woodbury, N. J. Application filed August 7, 1873.

Claim.—A wood-screw, with a thread of varying pitch, gradually decreasing from the point throughout the whole of its length, as shown and described.

146,024.—Feed-Water Heater.—WILLIAM SAMBROOK, Liverpool, England. Application filed July 7, 1873.

The chamber is divided into two compartments by a perforated diaphragm. Into one compartment the steam is admitted from the boiler, passes through the diaphragm, and mingles with the feed-water admitted through a perforated pipe, and is heated by the steam. Suitable valves are arranged in the pipes.

Claim.—The feed-water heater herein described, consisting of the chamber a^1 a^2, combined with a perforated diaphragm-plate and a perforated pipe, and fitted with suitable cocks and valves, the whole constructed and arranged, with reference to each other, substantially as set forth, for the purpose specified.

146,025.—Malt-Drier.—JOHN G. SCHIFFER, San Francisco, Cal. Application filed May 3, 1873.

The horizontal stirrer revolves on its axis, and is at the same time carried around in a circular kiln by a revolving vertical

shaft, to which it is connected at right angles. The scoops of the revolving stirrer lift up and invert the malt, and the brushes attached to the back of the scoops brush forward the scatterings left by them. A cover over the stirrer prevents any malt from being thrown out of the kiln. Scrapers attached to the cover level the surface of the malt and prevent its accumulation at the outer circumference of the kiln. The stirrer can be lifted from working position by a lever, which may be held in a ratchet.

Claim.—1. The stationary central tube D, with its inverted crown-wheel E, and the upright revolving shaft F, with its arm J, in combination with the shaft K, with its pinion *m* and spur-wheel *n*, hangers *o*, and revolving stirrer, all combined and arranged substantially as and for the purpose above described.

2. The shaft *s*, with its scoops *r r* and brushes *t t*, in combination with the shield or cover V, substantially as and for the purpose above described.

3. The plow-shaped levelers or scrapers W W, in combination with the rotary scoops and brushes, substantially as and for the purpose described.

4. The hangers *o*, with their arms *z*, in combination with the shaft *b*, with its arms *d*, links R, pawl-lever *f*, and rack *g*, all combined and arranged substantially as and for the purpose above described.

146,026.—Blade for Agricultural Implements.—WINFIELD SCOTT, Floyd Court-House, Va. Application filed July 19, 1873.

A blade for hoes, mattocks, &c., made concave and thin at the middle, with thickened edges.

Claim.—In an agricultural implement, the blade A, having its inner surface and cutting-edge concave, and the thickened sides or points B, all as shown and described.

146,027.—Bevel-Rest.—JOHN E. SEAVEY, Kennebunkport, Me., assignor to himself, RAWSWELL P. TIBBETTS, and GEORGE F. SEAVEY, same place. Application filed October 22, 1873.

Three bars are so arranged that any angle may be obtained whereby a board can be beveled.

Claim.—As an article of manufacture, the bevel-rest, constructed substantially as and for the purpose described.

146,028.—Shutter-Fastening.—HENRY A. SKINNER, Worcester, Mass. Application filed November 1, 1873.

The rod or spindle is arranged to make a full half-turn within the barrel containing it, and the beveled face of the catch striking against a pin on the window-sill is tipped downward, admitting the pin between the catch and its corresponding lip, until the handle falls downward, bringing the catch back to its horizontal position and fastening the shutter.

Claim.—1. The rotating blind-fastener consisting of the rotating rod or spindle A, with its catches B C, handle D, and case or barrel E, with its lips F F, made and used as and for the purpose specified.

146,029.—Ladder.—ANTHONY PRESTON SMITH, Sacramento, Cal. Application filed October 28, 1873.

The ladder is strengthened by rods let into the edge and sides of the side rails. One end of each rod is riveted to a plate at the end of the ladder, while the other end is provided with a thread and nut for tightening the rods. The rods are held in the grooves by staples and by eye-rods which pass through the rounds.

Claim.—The rods *c c*, with or without the rods *i i*, screw-bolts *d*, plates *e*, and screw-nuts *f*, in combination with the rails A and rounds B of a ladder, when constructed and operating substantially as and for the purpose set forth.

146,030.—Wheel-Cultivator.—WILLIAM H. STRONG, Clinton township, Seneca county, Ohio. Application filed May 19, 1873.

Crank-levers for raising the plows are connected by a removable bar. When this cross-bar is removed the foot-levers may be operated independently of each other.

Claim.—In a wheel-cultivator, the lugs A A, cranked levers D E, bar F, chain G, and hooks I I, arranged and attached in the manner described, and for the purpose hereinbefore set forth.

146,031.—Process for the Reduction of Copper and other Ores.—HENRY STULL, Ione City, Cal. Application filed October 13, 1873.

The ores, which generally contain sulphur, are burned, in the presence of air and steam, in the lower of two chambers, whereby sulphites are formed. These sulphites are transferred to an upper chamber, sprinkled with sulphuric acid, and subjected to the sulphurous fumes from a new charge in the lower chamber, whereby sulphates are produced. The copper is then reduced by the usual iron process.

Claim.—The process herein described of reducing ore by the use of two chambers, situated one above the other successively, substantially as herein described.

146,032.—Broom-Corn-Seed Flour for the Manufacture of Paste.—JAMES W. TALLMADGE, Boston, Mass. Application filed October 22, 1873.

Claim.—The broom-corn-seed flour, composed of broom-corn seed and potatoes, prepared and made as herein described.

146,033.—Plate for Tramways.—SAMUEL D. TILLMAN, Jersey City, N. J. Application filed August 4, 1870.

A flat metal plate or rail for street tramways, adapted for ordinary vehicles only, and having a series of longitudinal strengthening-ribs on its under side.

Claim.—The wide plate C for tramways, provided with a series of webs, *c*, running longitudinally underneath, and arranged, as specified, relatively to the plate and each other, so that a uniform bearing-strength will be obtained.

146,034.—Bridge.—JAMES VALLELEY, Canton, Ohio. Application filed August 4, 1873.

A bridge-arch consisting of a hollow trunk of four or six sides, and formed of flat plates or of flat plates and lattice-bars, united by angle-bars, the cross-section of the trunk being trapezoidal in form. Also, a shoe for the arch of two metal pieces, one of which receives the end of the arch, and is supported by trunnions in bearings on the top of the other piece, which is embedded in the foundation, so that the piece supporting the end of the arch can adjust itself to the expansion and contraction of the arch.

Claim.—1. A bridge-arch consisting of a tube made trapezoidal in cross-section, and formed of four plates, *a a b c*, as and for the purpose described.

2. The shoe, composed of the two pieces *h* and *i*, and connected by the shaft *k*, and arranged with the chord and the foundation, substantially as specified.

146,035.—Lid-Lifter.—WASHINGTON VAN GAASBEEK, Hudson, N. Y. Application filed April 5, 1873.

A pivoted button is attached to one horn of the forked jaw, and adjusts itself to different forms. By reversing the implement the button forms a lifter for stove-covers.

Claim.—The self-adjusting lever A, in combination with the projection C, substantially as described, and for the purposes set forth.

146,036.—Sole-Edge Trimmer.—WILBUR WEBSTER, East Jaffrey, N. H. Application filed December 3, 1873.

Claim.—The guard B and its beveled edge-carrier C, and the knife-blade A, constructed and arranged together and within the handle D, and supported therein by a set-screw screwed into it, all as shown and described.

146,037.—Cotton-Bale Tie.—LEOPOLD WEIL, New York, N. Y. Application filed November 8, 1873.

Rectangular slots are formed in the ends of the bands, and the ends secured by a flat metallic key.

Claim.—The ends B C of the bale-band, having a series of rectangular slots, A, with their lips D, in combination with the key E, substantially as shown and described.

146,038.—Egg-Carrier.—WENDELIN WEIS, St. Paul, Minn. Application filed August 4, 1873.

Two strips are employed, one of which is slitted a short distance on each edge. The other has a slit in the center, with an extension horizontally, so that the other strip can be inserted in it and secured in the edge slits.

Claim.—The combination of the strips B, having open edge slots *a*, with the strips C, having the closed slots *b*, with extensions *b'* arranged at an angle thereto, all as shown and described.

146,039.—Steam-Boiler.—OSCAR W. ALLISON, Buffalo, N. Y., assignor of one-half his right to ROBERT DEMPSTER, same place. Application filed November 24, 1873.

The products of combustion passing out of the rear of the furnace, thence in opposite directions between sections of vertical tubes connected by means of space-blocks, for preventing the products of combustion from passing through them and around solid sections to the up take.

Claim.—1. The combination, in a steam-boiler, with the water-chamber A, steam-chamber B, and furnace E, of the series of water-tubes N and connecting space-blocks, substantially as and for the purpose hereinbefore set forth.

2. The arrangement, in a steam-boiler having a water-chamber, A, steam-chamber B, and furnace E, of the outer series of water-tubes N and two inner series, N' N', and connecting space-blocks, substantially as set forth.

3. The combination, in a vertical steam-boiler, and with the water-tubes thereof, of the connecting space-blocks *c*, made concave at the sides to fit between said tubes, substantially as and for the purpose hereinbefore set forth.

146,040.—Sugar Manufacture.—HERMAN M. ASCHENBRENNER, Havana, Cuba, assignor to himself and THEOPHILUS MASAC, same place. Application filed November 1, 1873.

Claim.—1. The combination, in the manufacture of sugar, of the following processes: First, precipitation of the juice by lime and magnesia, and steam-heat; second, evaporation of the juice in conductors by steam-heat; and, third, evaporation of the juice in conductors by steam-heat and an air-blast, substantially as specified.

2. The combination of conducting-tank 1, filters *a b*, flannel filter 3, receiver 2, and double-bottomed steam-heating kettles 4, the tank 1 being arranged to receive the juice from the sugar-mill, substantially as specified.

3. The combination of the kettles 4, siphons 5, filter 6, sulphur-chamber 8, and the evaporating conductors 10, substantially as specified.

4. The combination of the scraper 14 with the evaporating conductor 12, substantially as specified.

5. The combination of the conducting-tank 1, filters *a b*, flannel filters 3, tank 2, kettles 4, filter 6, pump 7, sulphur-chamber 8, evaporating conductors 10 12 15, fans 13 and 16, and the endless scraper 14, substantially as specified.

146,041.—Clamp for Splicing Broom-Handles, &c.—CHARLES L. W. BAKER, Camden, assignor to JOHN L. MASON, New Brunswick, N. J. Application filed December 3, 1873.

A socket, formed of a plate bent around the handle, with its longitudinal ends turned out to lie face to face. These are clamped by nuts on screw-threaded bent ends of a rod lying along the back of such faces.

Claim.—The splice for handles of brushes, &c., consisting of the flanged tube A, in combination with the longitudinally-arranged rod D, having its ends bent and passing through the flanges of the tube A, and with the nuts G, substantially as and for the purpose set forth.

146,042.—Holdback for Vehicles.—HIRAM M. BURDICK and MOSES R. FLANDERS, Ilion, N. Y. Application filed October 8, 1873.

Claim.—A holdback for carriages consisting of the plate A, provided with the recess *i* and grooved projections C, in combination with the loop B, provided with the lugs *a*, all constructed and combined to operate substantially as described.

146,043.—Machinery for Lasting Boots and Shoes.—AUGUSTUS C. CAREY, Malden, assignor of two-thirds his right to GEORGE F. BEKED and DEAN PEABODY, Lynn, Mass. Application filed December 17, 1873.

Claim.—1. An organized machine for lasting boots and shoes, or uniting the upper and soles, by sewing, comprising the combination of a hollow last or work-support, provided in or around its tread or sole with a continuous needle passage or channel, and movable under the needle for the purpose of feeding the work along during the operation of sewing, and a sewing mechanism, consisting of a reciprocating needle, exterior to the last and a thread-carrier or its equivalent within the last for presenting the thread to the needle, said parts of the sewing mechanism being adapted to operate together, through the needle slot or passage around the sole or tread of the last, to sew through the insole and upper, or the insole, upper, and outsole, as the last is fed along under the needle, substantially as set forth.

2. The movable hollow last, provided in or around its tread or sole with a needle passage or channel, and carrying within it a thread-carrier, held and adapted to move in a groove on the under side of the sole parallel with the needle-passage, in combination with a reciprocating barbed needle, entering the needle-channel in the last, and operating, in connection with the said thread-carrier, as herein shown and set forth.

3. In a machine substantially such as described, a hollow last, containing within it the thread-carrier or equivalent device, to operate, in connection with the needle, to form the stitch, and the spool or bobbin from which the supply of thread to form the stitch is drawn, substantially as shown and set forth.

4. The hollow last, provided with a removable tread or sole proportioned in size and shape to the opening in the bottom of the last, so that, when in place, it will leave between its outer edge and the surrounding edges of the body of the last a continuous channel or passage, through which the needle may penetrate to the interior of the last, substantially as shown and set forth.

5. In combination with the last, the mechanism, constructed and arranged as herein shown and described, for supporting said last, and allowing the necessary freedom of movement to permit it to be fed along, and to present properly the successive portions of the work to the needle during sewing operation.

6. The combination, with the hollow last and the sewing mechanism, operating together as described, of the last-supporting mechanism and the top and edge gages and pattern, whereby the last may be accurately guided and maintained in proper position as it is fed along, substantially as shown and set forth.

7. The combination, in a machine substantially such as described, with the hollow channeled last or work-support, of the reciprocating needle, needle-slide, and slide-supporting frame, adjustable to vary the angle of obliquity or inclination of the needle with respect to the last, substantially as shown and set forth.

8. The reciprocating crimper, supported by and moving on the top gage, in combination with the last and sewing mechanism, substantially as shown and set forth.

9. The last-holder or matrix, divided longitudinally into two parts, hinged together as described, and provided with a pattern-flange, adapted to operate, in connection with the top and edge gages on the machine, substantially as shown and described.

146,044.—Treating Oils for Paints, &c.—DONALD D. CATTANACH, Providence, R. I. Application filed August 11, 1873.

Consists in agitating together raw linseed-oil and water, and then subjects the oil to lime, or carbonate of lime, for removing acids. The oil is then treated with a solution of vinegar of lead; then is exposed to the sun, and agitated night and day until the oil assumes a whitish or pale-amber color. The oil is still subjected to further agitation, and exposed to the air and daylight. Here the oil by degrees assumes the consistency of thick dough; if carried far enough becomes more solid; as the solidity or density increases it becomes tough, stringy, and elastic.

Claim.—1. The process of treating linseed-oil, and kindred oils, for the purposes stated, by subjecting the oil to agitation in the presence of air, or light and air, or the specified equivalent oxidizing agent, in the manner described, with or without the preliminary purification of said oils, as set forth.

2. The gum or gum-like substance made from linseed-oil or kindred oils, substantially in the manner and by the process described.

146,045.—Apparatus or Cock with Safety-Plug.—PIERRE A. CHAMBREAUX, Paris, France. Application filed February 28, 1873.

To the end of the plug is permanently attached, by brazing or riveting, a chain and ring, of sufficient size to prevent the entire withdrawal of said plug, but to allow of sufficient movement to admit of cleaning and adjusting the plug to the entrance and exit pipes of the gas-meter; the object being to prevent fraud.

Claim.—The combination, with the plug D, of the ring G, chain H, and knob I, substantially as described, and for the purposes set forth.

146,046.—Wire-Stretcher.—ISAAC H. CONGDON and JACOB E. HOUSE, Omaha, Neb. Application filed November 1, 1873.

An iron frame detachably secured to posts supports two cylinders on opposite sides thereof, which are revolved by hand-crank for tightening the wires from both sides, and holding-pins inserted through the sides of the frame, and into perforated end flanges on the cylinders, prevent the cylinders from turning back.

Claim.—A wire-tightening attachment for fences, comprising the frame B B', rollers C C, perforated end disks *d*, arbors *g*, lock-pins *f*, and detachable hand-crank D, when the various parts are constructed and relatively arranged to operate in the manner set forth.

146,047.—Safe and Vault.—JOHN CRUMP, Philadelphia, Pa. Case B. Application filed April 8, 1873.

The safe or vault body or door is constructed of an outside plate having its inner face provided with transverse ribs of an irregular cross-section, and of a backing or filling of franklinite, chilled iron, or like material, applied and held by the ribs, substantially as shown and described.

Claim.—1. A vault or safe body or door consisting of an outside plate, having its inner face provided with transverse ribs of an irregular cross-section, and of a backing or filling of franklinite, chilled iron, or like material, applied and held by the ribs, substantially as shown and described.

2. The cast-iron body-plates A, having the ribs formed solidly on their inner faces, in combination with the backing of franklinite, chilled iron, or like material, held in place solely by the ribs, the latter being made of such form in cross-section as to interlock with said material.

3. In combination with the cast-iron plates or sections A, provided with the drill-proof backing, and united at their edges, as set forth, the wrought-iron facing C, screwed or riveted to the cast-iron, for the purpose of concealing and protecting the joints therein.

4. The safe or vault body consisting of the plates A, having the ribs *a*, filling or backing B, of franklinite or like material, hard-metal plate D, non-conducting material E, and inside plate F, all united and arranged as shown and set forth.

146,048.—Safe and Vault.—JOHN CRUMP, Philadelphia, Pa. Case A. Application filed April 8, 1873.

The ribbed body-plates are constructed of cast-iron, and the spaces between the ribs are filled with chilled iron, drill-proof backing, and a layer of non-conducting material, all secured in place by a cast-metal plate. Hardened steel bars and rubber strips are arranged in the joints between the body-plates.

Claim.—1. The hardened steel bars *b*, inserted between the body-plates A of an iron safe or vault, substantially as and for the purpose set forth.

2. The cast-iron body-plates or sections A, having their abutting edges provided with grooves *c*, in combination with the rubber strips G inserted therein, as shown and described.

3. The safe or vault body consisting of the ribbed body-plates A, provided with the drill-proof backing, arranged as described, and with the concrete lining or backing I of non-conducting material, applied between and held by the ribs, all combined and arranged as shown.

4. In combination with the cells having shoulders *d*, a hardened plate or layer and a layer of non-conducting material, K, arranged therein, and a plate of metal cast therein, substantially as shown and described.

5. The combination of the chilled plate B, backing H, non-conducting material K, and cast-metal plate J, when arranged in the cells of an iron vault or safe wall, substantially as described.

146,049.—Windmill.—EDWARD CRUMP, Waterloo, Wis. Application filed June 24, 1873.

A series of fans are placed beyond the ends of the blades or sails of the wheel, their edges parallel with the axis of the wheel, and so arranged that their resistance to the motion of the wheel regulates the speed, and prevents its being increased beyond a certain degree.

Claim.—A series of fans, E, in combination with the wheel A, constructed and operating substantially as described, for the purpose herein before set forth.

146,050.—Sharpening-Machine.—JAMES H. CURRAN, Rochester, assignor of one-half his right to TRUMAN B. JOHNSON, Seneca Falls, N. Y. Application filed September 19, 1873.

The table and grinder are attached to a frame capable of angular adjustment, the table having an independent vertical adjustment. The gage is connected to the table by parallel arms, and slotted on its under side to receive the cutter-bar of a harvester.

Claim.—1. In combination with the adjustable frame C, the grinding-wheel D and the independent vertically-slotted table E, when said parts are made attachments of the frame, substantially as described, for the purpose specified.

2. In combination with the vertically-adjustable table E and grinding-wheel D, the swinging guide K and parallel arms *p p*, when arranged to operate in the manner and for the purpose specified.

146,051.—Stone-Tool.—IRA CURTNER, Dayton, Ohio, assignor to CHAS. A. GUMP and EDWIN S. FORGY, same place. Application filed September 20, 1873.

A ferrule having a screw, the end of which enters a recess formed in the lower side of the pick-blade, which is inserted in the blade-socket band.

Claim.—The combination, with the T-coupling, having the blade-socket *b* and shank-socket *h*, of the screw-ferrule C, provided with the boss *k* to enter a central recess in the blade, substantially as specified.

146,052.—Photographic Monocular Glasses.—AUGUSTE J. DALLEMAGNE and LOUIS TRIBOULET, Paris, France. Application filed July 16, 1873.

A metallic case with an opening from front to back, and provided with a magnifying-lens, through which is seen a revolving transparent picture-disk.

Claim.—The case B, provided with an opening from front to back for the reception of a magnifying-lens, the revolving glass plate or picture-disk A, toothed wheel A', with its operating-shaft, spring-pawl B', and thumb-screw D, all constructed, combined, and arranged substantially as and for the purpose set forth.

146,053.—Railway-Car Window-Screen.—JOHN E. EARLE, New Haven, Conn. Application filed September 14, 1873.

A screen for car-windows formed of perforated, netted, or woven vertical slats set diagonally in the frame, and parallel to each other, so as to leave a space between the slats. The screen is so arranged that the motion will create a strong outward draft between the slats, carrying off dust and smoke.

Claim.—A window-screen formed from perforated, netted, or woven vertical slats set diagonally in the frame, and parallel, or nearly so, to each other, so as to leave a space between the slats, substantially as set forth.

146,054.—Cane.—FRANK ECKSTEIN, New York, N. Y. Application filed December 3, 1873.

The handle has a sword or dirk fixed to it, which is incased in the stick. The stick is bored throughout, and has a barrel on its end for an air or spring gun. An umbrella-frame may be detachably attached to the stick.

Claim.—The cane A, provided with the barrel B, bore D, handle E, and sword E', with or without the detachable umbrella, constructed, arranged, and combined substantially as and for the purpose described.

146,055.—Air-Compressing Apparatus.—JOHN ERICSSON, New York, N. Y., assignor to CORNELIUS H. DELAMATER and GEORGE H. ROMINSON, same place. Application filed September 12, 1873.

A constant circulation of cold water is maintained through the piston-cylinders above the pistons. The throttle-valve of the engine is connected with a governor consisting of a small piston-cylinder opening into the discharge-passage of the compressor. The motive power is so applied to the piston-rods of the pump-cylinders that the greatest power is exerted upon the pistons when they meet the greatest resistance—*i. e.*, as they approach the ends of their compressing-strokes.

Claim.—1. The combination of the water-pedestal B, the cylinders H H of the single-acting air-pump, the pistons I I, a duct for conveying cold water to the interior of the pump-cylinders on top of the pistons, and one or more upper overflows or outlets from said cylinders to the pedestal, substantially as and for the purposes specified.

2. The combination, with the engine and one or more air-pumps operated thereby, of a compressed-air governor, S, organized substantially as herein described, to control the steam-supply to the engine, and whereby the motion of the engine is regulated by the draft made upon the air as compressed by the pump or pumps, essentially as herein set forth.

3. The combination, substantially as herein described, of the air-compressing cylinders H H and their single-acting pistons I I, the engine-piston A, the beam M, the cranks D G, the engine-shaft E, and the connection Q, whereby the power of the engine throughout its stroke is approximately equalized to meet the varying resistance encountered by the pistons of the pumps, as specified.

146,056.—Bit-Stock.—LAURENCE FEELY, Rochester, N. Y. Application filed November 7, 1873.

Two shanks are pivoted to the brace, either of which can be thrown into position, central springs acting upon them.

Claim.—A brace or bit-stock having two sockets or bit-holders, C C, pivoted to the holder A, and adapted to receive different tools, in combination with the flat springs E E, arranged in the holder A, between it and the sockets C, substantially as described, for the purpose described.

146,057.—Valve.—BENAIAH FITTS, Worcester, Mass., assignor to UNION WATER-METER COMPANY, same place. Application filed November 13, 1873.

Back strain upon the supply-pipe is averted by the employment of a channel or groove in the valve-seat and in the lower edge of the valve.

Claim.—The slide-valve *b* and its operating screw-rod *d*, in combination with the outlet-opening *a* of a hydrant, provided with an opening, *c*, formed in the manner and for the purpose set forth.

146,058.—Mortising-Tool.—HARRISON K. FORBIS, Danville, Ky., assignor to himself and JOHN W. PROCTOR, same place. Application filed November 15, 1873.

The sides of the shank are recessed, forming cutting-edges, and a notch is formed in the end for cutting-bits.

Claim.—As an article of manufacture, the tool A, having opposite rabbets, notch F, boring-bits G G', and side cutters E H, the whole constructed substantially as and for the purpose described.

146,059.—Spindle-Whirl for Spinning-Machines.—MERRILL A. FURBUSH, Philadelphia, Pa., assignor to himself and CHARLES A. FURBUSH, same place. Application filed November 8, 1872.

For catching the drip from the bolster and preventing its being thrown centrifugally upon the driving-band while the spindle is in rotation, and allowing it to pass below the whirl and band when the spindle is stopped.

Claim.—The combination, with a spinning-machine spindle, of a pulley having an undercut recess and channel, as set forth.

146,060.—Corn-Planter.—E. CHAPMAN GAGE, Witoka, Minn. Application filed December 31, 1872.

Claim.—The combination of a spout, K, pivoted plow I, and a scraper, J, arranged as described.

146,061.—Cotton-Chopper.—JOSEPH M. GARRETT, Brenham, Tex. Application filed August 16, 1873.

The chopper-knives are geared by belts to the traction-wheels. A tilting frame carries the plows, which are pivoted to hangers depending from the main frame and operated by a compound lever.

Claim.—In combination with the frame A, carrying a cotton-chopper operated by belted gearing from the traction-wheel D D, the swinging frame L, plow-standard M, lever N, and connecting-bar A, substantially as specified.

146,062.—Annular Leather Washer.—PIERRE L. GIBBS, Chicago, Ill. Application filed October 17, 1873.

Claim.—1. The annular washer *B*, made from a leather strap which is rolled or bent into form and joined at the ends, substantially as described.

2. An annular washer constructed of a single piece, in one or more thicknesses of leather, by bending or rolling a strap of the requisite length, substantially as specified.

146,063.—Mill-Spindle.—JOHN A. HAFNER, Pittsburg, Pa. Application filed August 27, 1873.

A spring within a casing, which consists of two plates through which the spindle passes, connects the casing with the shaft, one end of the spring being secured to a central hub which is keyed to the spindle, the other to the bottom plate, which is secured to the upper one. A gear-wheel is secured to the upper plate. The device acts as an equaliser.

Claim.—1. The combination of the hub *c*, having the lug 9, and the plate *d*, provided with the grooves, as specified, for causing the casing to revolve with the pinion, substantially as set forth.

2. The grooved plate *d*, having the projections 5, in combination with the plate *f*, spring *e*, hub *c*, and spindle *a*, substantially as shown.

146,064.—Work-Holding Device.—FRANCIS E. HAHN, Philadelphia, Pa., assignor to OSCAR C. FERRIS and FREDERICK B. MILES, same place. Application filed August 4, 1873.

Claim.—1. The combination, in a drilling, milling, or other metal-working machine, of a vertically-adjustable bracket, E, its pin B, and the block A, which admits of being adjusted longitudinally and turned laterally on the said pin, and which has two or more supporting or retaining appliances, all substantially as and for the purpose set forth.

2. The combination of the block A, having different appliances for receiving and retaining objects, the pin B, having as many grooves as there are different appliances on the block, and the set-screw *x*, or a key adapted to the block and grooves, all as set forth, for the purpose specified.

146,065.—Chair.—HENRY S. HALE, Philadelphia, Pa. Application filed November 21, 1873.

The bottom or back is composed of wooden stripe united to a canvas backing.

Claim.—A chair with the frame of which is combined a seat or back, or both, consisting of wooden stripe united to a canvas backing, all as set forth.

146,066.—Car-Window Shield.—HENRY S. HALE, Philadelphia, Pa. Application filed August 15, 1873.

To the bar which is placed under the raised sash of the window are secured a number of slats attached to a suitable backing. When the shield is unfolded for use it is kept in position either by a cross-bar or an elastic cord.

Claim.—A window-shield for railroad-cars, consisting of the bar A, adapted to the window-slats B, and elastic backing *a*, all combined substantially in the manner described.

146,067.—Wooden Mat for Picture-Frames.—HENRY S. HALE, Philadelphia, Pa., assignor to HALE, KILBURN & Co., same place. Application filed August 15, 1873.

Claim.—The within-described wooden mat, composed of an intermediate frame made of four pieces, united as shown, and having veneers glued to the said frame in respect to the grain of its wood, as specified.

146,068.—Water-Wheel.—JOHN B. HAMILTON, Loudon, Tenn. Application filed February 8, 1873.

The disk is constructed with a beveled surface flaring upwardly and outwardly, for the purpose of having the spaces between the buckets larger at their entrance than at their delivery, thereby increasing the impact of the water on the wheel. The buckets are tapered and spurred.

Claim.—The tapered and spurred buckets B, combined with the beveled surface on the disk D, as and for the purposes described.

146,069.—Portable Cradle.—WILLIAM S. HARRIS, Trenton, N. J. Application filed November 8, 1873.

A rectangular frame, adapted to fold into small compass, is hung on the apex of a A-shaped stand at each end, the legs of which are hinged together at such point for folding purposes. When erected a fabric bottom is suspended from the frame, and an ornamental cloth hung around it.

Claim.—1. The combination, with a portable cradle, having the side rails hinged at their middle parts to fold vertically, and at their ends to fold laterally, as described and shown, of the hinges b^3, having their pintles located sufficiently forward of the corner-posts of the cradle, and of the pintles of hinges b^1, to allow the side rails to overlap parallel to each other, as specified.

2. The A-shaped legs C, hinged or jointed at their apexes, and affording pivotal bearings for the frame B, substantially as shown and described.

3. In combination with the rocking frame B and hammock A, the cords E, substantially as shown and described.

146,070.—Spoon.—JAMES HART, Philadelphia, Pa., assignor to SAMUEL H. JENKINS, NATHANIEL B. BROWN, and JOHN C. BELDEN, same place. Application filed July 21, 1873.

Claim.—A sheet-metal spoon, the handle of which is arched transversely at B and flattened at C, the latter part being bounded by a bead, *c*, the downwardly-projecting outer edge of which forms a continuation and unites the edges of part B, into which it also merges with its converging ends, all substantially as and for the purposes specified.

146,071.—Washing-Machine.—PIERRE HIRES, Knobnoster, Mo. Application filed November 22, 1873.

Claim.—1. The combination of the removable board C D and box A B, shaft E, lever G, and yielding bands *b'*, all constructed and arranged for operation as and for the purpose specified.

2. The box A, slotted at *a*, and board C D, arranged on shaft E, bands *b'*, pins *b''*, and lever G, in combination with the rubber I J and arms H, all constructed and arranged for operation as and for the purpose specified.

146,072.—Spring Bed-Bottom.—HENRY A. HIGBY, Sr., Fort Wayne, Ind. Application filed December 3, 1873.

The slat-frame is supported by a lateral bar at each end and in the middle. Beneath each slat is a pair of spring-bars, one end of each bar fixed to opposite sides of the bedstead, crossing each other diagonally upward, where a strap, rigid on one is loose on the other. Their other ends support the slat-frame at its sides with a slotted movement.

Claim.—1. The equalizing spring-bars D D, rigidly fastened at one end to a support, their other ends sliding on the part supported by them, and the bar connected by a coupling, G, which is rigidly secured to one and moving loosely upon the other bar, all arranged to operate substantially as and for the purposes herein set forth.

2. The equalizing spring-bars D D, in combination with the coupling G and bed-bottom A B, all arranged substantially as and for the purposes herein set forth.

3. A spring bed-bottom composed of the bottom A B, spiral springs C C, spring-bars D D, and links or couplings G G, all constructed substantially as and for the purposes herein set forth.

146,073.—Valve for Steam-Pipes.—JAMES W. HODGES, New York, assignor to himself and JOHN W. HARWAY, Bay Side, N. Y. Application filed June 7, 1873.

Above the valve-seat is constructed a diagonal partition upon a seat in which a second smaller valve operates, for the purpose of affording exit to water of condensation and air in the main pipe.

Claim.—The partition h and valve-seat *i*, introduced near one end of the barrel *a*, to regulate by the valve *k* the opening to the pipe *m*, in combination with the main valve *c* and connections *b* and *e* for the pipes, substantially as and for the purposes set forth.

146,074.—Illuminating Vault-Cover.—JOSHUA K. INGALLS, Starkey, N. Y. Application filed September 20, 1871.

Knobs or protuberances are located between the illuminating-lenses of a vault-light in the narrowest portion of the frame, for the purpose of strengthening it at the weakest points.

Claim.—In combination with a vault-cover, the ribs or protuberances *e e* arranged to surround, or partially surround, the lenses B B, for strengthening the iron plate and forming a better surface for walking upon, substantially as set forth.

146,075.—Joiner's Gage.—SIMEON H. JENNINGS, Deep River and WILBUR F. ARNOLD, Winthrop, Conn. Application filed October 1, 1873.

The perforation in the head is first made circular, then one side flattened by a metallic plate. The head is fastened by a cam-lever.

Claim.—As an article of manufacture, the gage constructed as described.

146,076.—Candy-Cutter.—JULIUS W. KASKEL, Paducah, Ky. Application filed December 16, 1873.

The revolution of the cylinder causes the forward movement of the piston, forcing out the candy in stick form, which falls upon the endless apron, to which it adheres, the continued revolution of the cylinder twisting the stick at the point of extension.

Claim.—1. The revolving batch-cylinder C, in combination with the reciprocating head or follower E', when operating in the manner substantially as described.

2. The revolving batch-cylinder C, having the removable head C'' and follower E, in combination with a bearing hinged at *c'*, in the manner and for the purpose described.

3. The combination of the revolving batch-cylinder C, having the follower E' and nozzle D, with an endless carrier, *b'''*, in the manner and for the purposes described.

4. The combination of the revolving batch-cylinder C, having the reciprocating follower E', with the heater I, substantially as and for the purposes described.

146,077.—Combined Tatting-Shuttle and Crochet-Needle.—EUGENE P. KELLOGG, New York, N. Y. Application filed December 2, 1873.

Claim.—The crochet-needle *b b'*, with the spring *c* integral therewith, in combination with the notched holding-slot *e* and the thumb-knob *f* of a combined tatting-shuttle and crochet-needle, substantially as described.

146,078.—Beer-Mug.—WILLIAM C. KING, Pittsburg, Pa. Application filed September 5, 1873.

Claim.—The new article of manufacture, of glass or other analogous ware, to wit, a beer-mug which is of oval or elliptical form in its horizontal section, and has its handle on one of its narrowest sides, or at right angles to its smallest diameter, as herein set forth.

146,079.—Lantern.—JOSEPH KINTZ, West Meriden, Conn., assignor to himself and P. J. CLARK, same place. Application filed November 1, 1873.

To facilitate the placement or removal of a lantern-globe, the upper ends of the guard-wires, being fixed to the lantern-cap, the lower wires are made to hook into and travel in vertical slots in the base-ring. Once so inserted, they are clamped downwardly by a rotating ring encircling the base, and having inclines on its under edge. The vertical guards are also clamped inwardly by horizontal guard-wires, connected by hoods, which slide vertically on the side guard-wires.

Claim.—1. In combination with the base C, provided with vertical slots I, the removable top B, and globe A, the vertical guard-wires D, horizontal guards F, and grooved plates G, to operate as shown and described.

2. The movable band or ring K, having inclines, in combination with the guard-wires D, base C, and top B of the lantern, as and for the purpose specified.

146,080.—Composition for Preserving Leather.—JACOB LAMPLUGH, Philadelphia, Pa. Application filed July 5, 1873.

Claim.—A leather-preserving composition consisting of burnt tallow, caoutchouc, and bees-wax, with or without other ingredients.

146,081.—Nut-Lock.—LODOWICK LEEDS, New London, Conn., assignor of one-half his right to ELISHA W. SHOLES and ALONZO W. SHOLES, same place. Application filed June 23, 1873.

Claim.—The outer nut *a*, having an eccentric circular recess or slot, *b*, to receive the eccentric inner nut *c*, in combination with the bolt, when constructed and arranged in the manner and for the purposes as herein shown and set forth.

146,082.—Carburetor.—J. BALDWIN LYMAN, Rockford, Ill. Application filed September 15, 1873.

The air-forcing reservoirs receive air through chambers having pipes provided with stop-cocks, which open externally. The stop-cocks are opened to admit the air to the reservoirs, and are then closed as the air is forced through the first chamber into the second or storing chamber, which communicates with the air-distributer in the gasoline-tank.

Claim.—1. The perforated air-chamber C, arranged within the tank A, as described, in combination with the air-chamber D, intermediate between the receiver G and chamber C, substantially as and for the purpose described.

2. The secondary or supply chamber E, provided with the supply and outlet pipes, as described, in combination with the holder G G' for the supply of the air to said holder, and for the transmission of the same to the storing-chamber D, as set forth.

3. The combination of the holders G G', supply and storing chambers D and E, tank A, and terminal chambers C, all arranged and operating substantially as and for the purpose set forth.

4. The air-chamber D in combination with the receivers G G', tank A, and connecting and supply pipes and their respective stop-cocks *c c'*, *d d'*, *e e'*, and F, arranged and operating substantially as and for the purpose described.

146,083.—Garden Implement.—JOHN M. LUNGUEAT, Atlanta, Ga. Application filed July 16, 1873.

Claim.—The combination of handle B, ferrule A, bar C, bolts *a a*, nuts *b b*, hoe D, and rake E, all arranged as described, and for the purpose set forth.

146,084.—Milk-Cooler.—ROSWELL P. MAIN, Canton, N. Y. Application filed June 24, 1873.

Water is introduced into a trough, from whence it passes through tapering tubes into flat tubes, and after traversing the length of the vat it returns and passes through a siphon into a trough, and then runs off through an elbow-pipe.

Claim.—The combination, with a milk-pan, A, of the flat tubes B B and B' B', with connections *b d*, trough C, with spouts *a a*, inlet-tubes D D, outlet-tube E, and trough G with adjustable elbow-pipe I, substantially as and for the purposes herein set forth.

146,085.—Apparatus for Delivering Sheets from Printing-Presses.—THOMAS J. MAYALL, Boston, Mass. Application filed July 21, 1873.

The sheets are delivered to the packing-cylinder and accumulated between it and endless tapes *c'*, two of whose supporting-shafts are mounted in arms of the cylinder-heads and sustained in position against the pressure of internal spring by a detent, *g*. The guard-fingers *h* direct the sheets around the cylinder. Spring-seated pulleys d^2 compensate for the increasing mass. The sheets are counted by a disk, rotated by a wiper, *w'*. This disk carries a pin, *l*, set for a given number, which, engaging with a lever, *k'*, releases the detent *g*, and allows the tape-frame to be carried down, as in Fig. 7, and a guide-frame, *r*, projected from the cylinder, when the tapes deliver the sheets.

Claim.—1. The combination, with the delivery-cylinder, of a dropping or delivery apron, formed by the tapes which run in contact with the cylinder, and automatically operated alternately to rise and embrace the cylinder and cause the sheets to accumulate thereon in layers, and to drop and permit the discharge of the said sheets, substantially as and for the purposes set forth.

2. The delivery-cylinder and independent cylinder-heads, mounted on the axis of said cylinder, in combination with the endless tapes, and the movable or dropping frame or arms carrying one or more of the pulley-shafts for the tapes, and hinged or jointed to the cylinder-heads, the whole operating as set forth.

3. The combination, with the cylinder-heads and dropping-frame, of the coiled springs for producing the rotation of the heads needed to effect the dropping of the frame, and the retaining hooks for holding the said heads in position against the pressure of the springs, as and for the purposes set forth.

4. In combination with the revolving cylinder, the cylinder-heads and their actuating springs, the lugs and dogs carried by said cylinder and cylinder-heads respectively, and adapted to engage with and disengage from one another at the time and in the manner set forth, and the retaining-hooks adapted to catch and hold the cylinder-heads upon disengagement of said lugs and dogs, the whole operating together, as and for the purposes set forth.

5. The combination, with the cylinder-heads and their retaining-hooks, of the tripping-lever and register-wheel, and pin carried by said register-wheel, substantially as shown and set forth.

6. In combination with the dropping-apron and delivery-cylinder, the hinged dropper or guide carried by said cylinder, and operating, in connection with the same and the dropping-apron, substantially as set forth.

7. The dropper, hinged to and carried by the delivery-cylinder, in combination with the lifting-pin in the cylinder-head, adapted to engage a finger on said dropper at the time and in the manner set forth, said parts being combined for joint operation, substantially as shown and described.

8. In combination with the dropping-apron or frame and the delivery-cylinder, the bent guide-fingers carried by said dropping-apron, and operating in connection with the delivery-cylinder, substantially in the manner shown and set forth.

146,086.—Water-Elevator.—DRURY J. MCMILLEN, Chillicothe, Mo. Application filed October 4, 1873.

A pair of gear-wheels of similar diameter, engaging each other and a driving-wheel, are secured upon horizontal rods carrying flanged rollers, about which pass ropes extending over sliding friction-rollers placed upon a rod below. The wheel-rods are operated by a lateral lever, whereby either wheel is raised and its operation reversed.

Claim.—The gear-wheels E E', arranged to engage each other in the manner specified, and secured to the rods D D', operating vertically by the action of the lever H, and provided with the flanged capstans I I', in combination with the sliding friction-rollers *e*, substantially as shown and described.

146,087.—Clothes-Frame.—JOHN C. MILLER, Rockport, Ind. Application filed August 2, 1873.

Two frames crossed and pivoted, and joined by rods. At the upper ends of the bars are cords extending from the upper rod on one side to a windlass having a ratchet and pawl.

Claim.—The clothes-frame described, having bars A A, connected at the knees *a* by the bar B, the top rounds E, provided with the cords G, ratchet-wheel *b*, and pawl *d*, substantially as shown and described.

146,088.—Plow.—JOHN J. MITCHELL, Hopkinsville, Ky. Application filed July 12, 1873.

The standard is formed with a narrow strip or breast upon it, which is the cutting-edge above the share. Behind this is a broad flange or seat, and to this is fastened the mold-board of wood, the outer front edge of which has a shoulder, upon which the breast-piece is fastened, making a flush surface.

Claim.—1. The foot-piece A, having along the front curved edge the breast *a* and parallel flange *d*, and at the lower end the flange *b*, substantially as shown in Fig. 3, and for the purpose specified.

2. The combination of the cast-iron foot-piece A, having breast *a* and flanges *b d*, the share B welded to the bar C, and the wooden mold-board D having its front part formed at, or nearly at, a right angle, all substantially as and for the purposes herein set forth.

146,089.—Hot-Air Furnace.—DAVID B. MORRIS, Pittsburg, Pa. Application filed April 1, 1873.

The dome E is of cast-iron; the outer dome is of sections of terra-cotta tile, connected by tongue-and-groove joints.

Claim.—1. In a heating-furnace for buildings, the sections *a* and the crown I of the outer dome G, joined and united together by tongue-and-groove joints *b*, in the manner and to obtain the advantages stated.

2. The outer dome G, the inner iron dome E, and the reservoir M, located and arranged directly upon the top of the grate-bed A, and in the relation therewith and with the hot-air chamber H, as shown and specified, and to obtain the advantages stated.

146,090.—Hoisting Apparatus.—CHARLES R. OTIS, Yonkers, N. Y. Application filed November 4, 1873.

On the side of the car are two air-tight cylinders, whose ends are closed by elastic diaphragms, and which communicate, by properly supported flexible pipes, with two fixed cylinders, whose diaphragms have weighted spindles, which pass through guides and are attached to levers, by which they operate the valves of an auxiliary cylinder, whose piston-rod in turn operates the engine-valves. The attendant is thus enabled to control the engine-valves by pressing upon the diaphragms in the car.

Claim.—1. The combination, substantially as herein described, of a stationary diaphragm, by means of a hose with a moving diaphragm, attached to and capable of moving with the car, or cage, or platform of a hoist, whereby the stationary diaphragm may be caused to lift a weight, as described.

2. The combination of two sets of diaphragms and two hose-pipes with an auxiliary cylinder, substantially in the manner and for the purposes described.

3. The combination of two sets of diaphragms and two hose-pipes with a stop and reversing valve, substantially in the manner and for the purpose described.

4. The combination of the springs with the lever of a stop and reversing valve, substantially as hereinbefore set forth.

5. Two diaphragms, one stationary and the other moving, combined by means of a hose, in combination with a lever and a stop and reversing valve, the combination being substantially such as herein set forth.

6. A stop and reversing valve, in combination with two sets of diaphragms, and two hose-pipes, and an auxiliary cylinder, substantially in the manner and for the purposes set forth.

7. A stop and reversing valve and a lever acting upon it, in combination with two sets of diaphragms and two hose-pipes, substantially as described.

8. The combination of springs with the piston of an auxiliary cylinder, and a stop and reversing valve, the combination being and acting substantially as hereinbefore set forth.

146,091.—Washing-Machine.—SAMUEL N. PAGE, Lamar Mills, Pa. Application filed October 2, 1873,

A corrugated driving-roller, in fixed bearings in suitable uprights, has three corrugated rollers hung on curved bars and hangers to a cross-bar, and adjusted by screws and springs.

Claim.—The uprights A A, having slots *d d b*, in combination with the rollers C D D, the latter being suspended from the bars E and hangers F, embraced by the adjusting-screws G G which depend from the bar H, pressed upward by the springs I I, substantially as shown and described, and for the purpose set forth.

146,092.—Working Scrap Iron or other Metals into Ingots.—DUBOIS D. PARMELEE, New York, assignor to CHARLES RUNYON, Yonkers, and FRANCIS ROBINSON, New York, N. Y. Application filed December 22, 1873.

About four pounds of scrap iron is placed over the mouth of the mold and the hammer slowly forced upon it, crowding it down a few inches into the mold. The hammer is elevated and the force of the blows gradually increased until the scrap is consolidated.

Claim.—1. The method herein described for consolidating iron or other scrap metal cuttings, by hammering the scrap into a mold in layers, substantially as described.

2. An ingot of iron or other metal cuttings, formed by hammering the scrap into a mold, substantially as specified.

3. The mold, provided with a conical bottom and flaring top, and attached to the base by means of dovetails or equivalent devices, as and for the purpose set forth.

146,093.—Carriage-Iron.—HENRY K. PORTER, Boston, Mass. Application filed February 3, 1873.

Claim.—1. The combination of the wrought-metal rod *l* and the cast-metal stud *m*, having the right-angle semicircular-grooved flange *e*, constructed and combined substantially as described and shown.

2. The combination of the cast-metal angle or arm *p*, formed with the offset lip *r* and riveting-pivots *s s*, and the straight arm *t*, constructed and combined substantially as described and shown.

146,094.—Tuck-Creaser for Sewing-Machines.—EDWARD POWELL, New York, N. Y. Application filed September 5, 1873.

The tongue, provided with the upturned edge over which the material is creased, is provided with a supporting-point to elevate the tongue from the bed-plate, to give the creasing member of the upper plate a greater movement in creasing. A finger on one spring-plate first bears on and holds the material, and then the projection on the upper plate is moved down against the cloth, resting on the creasing-edge. The pin prevents lateral deflection of the blades.

Claim.—In a tuck creasing or marking attachment for sewing-machines, the spring-plates, provided with a guide-pin, *f*, to prevent lateral movement, in combination with the prolongation or tongue *e* and supporting-point *c*.

146,095.—Steam Vacuum-Pump.—WILLIAM E. PRALL and DAVID A. BURR, Washington city, D. C.—Case A. Application filed November 21, 1873.

Disks secured to the valves controlling the admission of steam to the pumps partially obstruct or confine the current of steam, so that when a sudden reduction of pressure in the pump to which it is flowing takes place, through exhaustion or condensation, the confined steam assists the movable piece placed in a channel of communication between the two pumps in moving the valves.

Claim.—1. The within-described method of automatically moving the valve or valves controlling the admission of steam to a steam and vacuum pump, by means of vanes or disks combined with said valve or valves, to obstruct or partially confine the steam-current in its passage to either chamber of the pump.

2. In combination with a valve or movable piece controlling a steam-port, a disk or vane placed exterior to said port, yet connected with said valve, and against which the steam-current passing through the port shall impinge, substantially as and for the purpose herein set forth.

3. In combination with each other, and with the valves controlling the steam-induction ports of a double-acting steam-pump, a rod connecting said valves, a piston or diaphragm secured to said rod, and placed in a channel of communication between the working-chambers of the pump, and disks or vanes attached to each valve, all substantially as and for the purpose herein set forth.

146,096.—Baling-Press.—JOHN B. ROOT, New York, N. Y. Application filed November 1, 1873.

Claim.—In a baling-press operated through the medium of a cylinder-piston and piston-rod, connecting together at their extreme ends by a single bolt, *b*, the platen-rods F, yoke-links H, and radius-arms D, as herein shown and described.

146,097.—Sectional Steam-Boiler Connection.—JOHN B. ROOT, New York, N. Y. Application filed March 15, 1873.

Each return-bend has on its face nozzle projections which fit into the opening in the head made to receive the tube. Compressible packing is inserted in a recess made in the bend and in the head, forming a tongue-and-groove joint.

Claim.—The combination of the nozzles *f* of the bends C, the grooves *d d* in the faces of the bends and heads B B, and the soft or compressible packings *e e* forming tongues within the said grooves, for the purpose of connecting parallel pipes in clusters, substantially as shown and described.

146,098.—Sharpening-Machine.—HUGH B. ROSKE, Cazenovia, N. Y. Application filed October 28, 1873.

Claim.—1. In combination with the pivoted holder 5, the socket 1, having the forked arm 2, cast with it in a single piece, and which can be adjusted back and forth, and swung around from side to side, substantially as set forth.

2. The adjustable hooks 7, in combination with a bar, 6, for holding the knife, substantially as specified.

3. The combination of the adjustable socket 1, pivot 4, dovetailed holder 5, bar 6, and hooks 7, with the grindstone *a*, substantially as shown and described.

146,099.—Water-Cooler.—WILLIAM F. RUTTER, Philadelphia, Pa. Application filed May 26, 1873.

The studs on the rack prevent the ice shifting.

Claim.—The rack B with studs C C, and the water-cooler A with ledges or rim B, combined and operating as herein set forth.

146,100.—Vehicle-Spring.—CYRUS W. SALADEE, Pittsburg, Pa. Application filed May 1, 1873.

Claim.—A compound spiral spring composed of two or more plates, rods, or bands riveted together at or near their ends and bent into form, substantially as described.

146,101.—Loom for Weaving Filed Fabrics.—HALCYON SKINNER, Yonkers, N. Y. Application filed November 12, 1873.

The wheel for operating the loom by hand is placed on a pivoted stand and controlled by the same treadle that operates the brake, so that when the latter is released the former is put in gear with the driving-pulley. The weft-stop mechanism consists of feelers on a rock-shaft between the breast-beam and the lay, and their position controls the movement of a spring bolt or pin working vertically through a pivoted horizontal elbow-lever, one arm of which engages with the shipper-lever. When the weft fails, a finger on the lay comes in contact with the upper end of the slide-bolt and stops the loom. The picking-cams and the double wire-operating cam are placed on the same shaft, and the parts so arranged in relation to the crank-shaft that a shuttle is thrown when a wire is inserted, and when one is withdrawn, thus two shots of filling being laid and beaten up for each wire. The wire-operating mechanism consists of a withdrawing-carrier and its hook, running on a straight and fixed slide-rail, and an inserting-carrier, with jaws to receive the wire-head, running on a rail placed in front of that on which the withdrawing-carrier moves, the two carriers being connected by a link, and reciprocated by the same lever. The outer rail is so curved as to give the required forward-and-back movement to the inserter, and is also elastic, that it may yield as the reed drives up the wire. A cam-piece is so arranged on the breast-beam as to hold the inserting-carrier at its innermost position, and so prevent the wire from springing back as the lay retreats.

Claim.—1. The combination, with the treadle S and arms Z, *l*, and *e* of their respective parts, by which the brake is released from the wheel E, of the sliding piece R, the pivoted stand Q, operated by the latter, and hand-wheel P, with its shaft *p* and bevel-wheels *r s*, whereby the brake is simultaneously released with the putting of the hand-wheel into gear by the action of the treadle, substantially as specified.

2. The movable pin A^1 and arm s^1, in combination with the feelers C^1 and arm i^1, for arresting the motion of the loom when the weft breaks or is expended from the bobbins, essentially as herein described.

3. The arrangement on the same shaft, H, of the picker-operating cams D^1 D^1, carried by the disks or flanges F^1 F^1, and the double wire-operating cam E^1, for action in relation with the crank-shaft G, which operates the lay, substantially as specified.

4. The outer curved slide F^2 and inner straight slide E^2, arranged in front of the lay and below the shuttle-box, in combination with the wire-carriers C^2 D^2, all constructed to operate, in relation with each other, substantially as herein described.

5. The cam-piece G^2 on the breast-beam, in combination with the wire-carrier D^2, essentially as and for the purpose specified.

146,102.—Nut-Lock.—ALBERT C. SMITH, Fort Madison, assignor to himself, DAVID W. BLACKBURN, Keokuk, and SETH H. CRAIG, Fort Madison, Iowa. Application filed October 23, 1873.

A block of wood is interposed between two nuts and provided with projecting ends, that pass outside of the nuts and press against the threads of the bolts, which holds the device in place.

Claim.—The block or bar D, provided at each end with a shoulder or offset, *a*, to fit between the nuts C C, and the projecting parts *b b*, fitting between the bolts A A, substantially as and for the purposes herein set forth.

146,103.—Piano Pedal-Stool.—TRAUGOTT SPRINGER, Hunter's Point, N. Y., assignor to himself and GUSTAVE AUTENRIETH, same place. Application filed November 12, 1873.

Claim.—In a pedal-stool containing the treadle B, sliding rod D, and spring *d*, the guide-bar *f*, constructed and arranged substantially as shown and described.

146,104.—Drop-Light and Hanger.—WILLIAM STAEHLER, Brooklyn, E. D., N. Y., assignor to CHARLES F. A. HINRICHS, same place. Application filed October 11, 1873.

The tubular standard that slides in the fixed tube is provided externally with a notched groove, in which works the free end of a spring-coil, the other end of which is attached to the external tube. This spring-coil is so arranged that downward movement of the inner tube, which sustains the light, compresses the coil and increases the friction of its detached end in the groove, while a reverse movement allows the coil to expand, and the friction is diminished.

Claim.—1. The spring *n*, in combination with the grooved standard *d* and tube *a*, substantially as and for the purposes set forth.

2. The spring *n*, in combination with the grooved standard *d*, with depressions, the tube *a*, and packing *c*, substantially as set forth.

146,105.—Coating Oakum with Tar, &c.—JOHN F. STAIRS, Halifax, Canada. Application filed December 3, 1873.

Claim.—The means described for tarring tow or oakum, consisting of the rollers *a*, trough *b*, concentrating-tube *h*, and squeezing-rollers *k l*, in combination with the tar-kettle *c* and a pair of rollers in such tar-kettle, substantially as set forth.

146,106.—Nut-Lock.—JEROME B. SWEETLAND, Pontiac, Mich. Application filed November 26, 1873.

Claim.—The pivoted latch D, provided with the hook *i* and lugs *d d*, substantially as and for the purposes herein set forth.

146,107.—Flour-Packer.—SAMUEL TAGGART, Indianapolis, Ind. Application filed December 4, 1873.

The truncated cone-shaped mouth of the receiver incloses the spiral blades of the packing-auger, made in sections, and provided with upwardly-deflected circumferential packing-rims.

Claim.—1. In a packer for flour and other materials, the packing-blades D and E thereof, provided with upwardly-dedected circumferential packing-rims F, for the purpose described.

2. The auger-lesaes, having the inner oppositely-curved portions *g*, and the outward oblique terminations A, as and for the purpose described.

3. The spiral blades D and E and hub *d e*, made in sections, joined, interlocked, and secured, substantially as described, and to obtain the advantages stated.

4. The packing-auger, consisting of the sectional hub *d e*, overlapping and dished sectional blades D and E, and the upwardly-dedected circumferential rim F, as and for the purpose specified.

5. The truncated cone-shaped mouth B of the receiver A, in combination with a packing-auger, as and for the purpose described.

146,108.—Ticket-Box for Railroad-Cars.—GEORGE C. THOMAS, Brooklyn, N. Y. Application filed May 14, 1873.

A series of ticket-boxes, arranged along the sides of railroad-cars, have doors which are locked by a single bar or rod secured by a single lock.

Claim.—1. A series of boxes having doors with locks, in combination with a bar, H, or its equivalent, whereby all the doors can be either locked or unlocked simultaneously, as set forth.

2. In combination with the door-bolts G of a series of ticket-boxes and the notched bar H, common to all the boxes, a lock at or near each end box of the series, for retaining and releasing the bar, all substantially as described.

146,109.—Illuminating Apparatus.—JAMES A. THOMPSON, Brooklyn, N. Y. Application filed June 14, 1873.

A ring, which is adjustable upon the gas-bracket, is adapted to hold a glass lens, and has arms for supporting a shade above the lens.

Claim.—The herein-described adjustable attachment for gas-fixtures and like purposes, consisting of the metallic rest or holder F, adapted to receive and hold the illuminator or lens A, and provided with standards S to support and hold the shade, and collar and set-screw D, all substantially as described, and for the purpose set forth.

146,110.—Frame for Holding Work on Sewing-Machines.—E. MALCOLM TURNER, Allegheny City, Pa. Application filed August 27, 1873.

A frame composed of two side bars, which are connected by lazy-tongs. These side bars are provided at one end with clamping devices, and at the other end are hinged to the side bars of another frame, which is also connected by lazy-tongs. The hinged frame is arranged so that it can be held at an angle to the main frame.

Claim.—The combination of the frame composed of the bars A A′ and lazy-tongs H, with suitable clamping devices, and the frame composed of the bars B B′ and lazy-tongs G, hinged to the former frame, and standing at an angle therewith, substantially as herein set forth.

146,111.—Glove-Turning Machine.—FREDRICK VANDERPOOL, Mayfield, N. Y., assignor to himself and JAMES E. WOOD, same place. Application filed November 15, 1873.

The glove is turned inside out by stretching the fingers over the tubes; then bringing the frame down till the ends of the rods and tubes meet; then drawing the glove up with the fingers over the rods.

Claim.—The combination, with the spring sliding frame B, provided with the pendent rods *f*, of the frame A A′ A, having the tubes C corresponding in number and placed opposite to the rods *f*, to enable the glove to be turned in the manner described.

146,112.—Car-Starter.—ISAAC C. WALLACE and JOHN W. ANDREWS, Detroit, Mich. Application filed November 4, 1873.

Claim.—1. In combination with the draw-bar G and the toothed disks M of the traction-wheels D′, the pivoted arms I, arranged to work at their rear ends upon or within the curved guide-bar K, and provided with the pawls L, substantially as and for the purpose specified.

2. In combination with the pawls L, pivoted to or upon the arms I, and arranged to engage with the toothed disks M, the tripping-lugs *k*, substantially as and for the purpose shown.

3. The draw-bar G, cross-bar H, pivoted arms I, guide-bars K, pawls L, and toothed disks M, combined and applied to a car-truck in the manner and for the purpose substantially as set forth.

146,113.—Nut-Lock.—CHARLES R. WATROUS, Mystic, Conn., assignor to himself and JAMES WATROUS, Jr., same place. Application filed April 29, 1872.

Claim.—1. The sharp-edged key *m*, combined, as shown, with the nut and bearing-surface, one of which is grooved and the other not grooved, so that after tightening the nut to its ect position the sharp key will cut a score or mark in the opposite surface in a position corresponding to the groove, as herein set forth.

2. A plurality of grooves in either the nut or the adjacent surface, in combination with a sharp-edged key and with the opposite plane surface, so as to allow the key *m* to be changed from one to the other, as herein specified.

146,114.—Roof-Truss.—PETER L. WEIMER, Lebanon, Pa. Application filed November 29, 1873.

A truss-frame for roofs in which the thrust of the compressive members is received by the tie-beam at only two points, and is transmitted to the junction of the principal rafters by only two tie-bolts, while each of the principal rafters is supported by the compression-pieces at two or more points.

Claim.—The truss consisting of main rafters B B, tie-beam A, diagonal rods D D′, and supporting compression-pieces E E′ F F′, the whole so constructed that each rafter has two or more supports, while the whole thrust or weight upon the truss is conveyed and supported at two points on the tie-beam, substantially as described.

146,115.—Suction-Tube for Planing-Machines, &c.—GEORGE C. WESTOVER, Vernon, Ind., assignor of one-third his right to JAMES A. MCCLELLAND, same place. Application filed October 27, 1873.

The inlet-tube near the exhaust-fan is branched, serving as bearings for the fan-shaft. A hooded catch-box, with a hopper-bottom, is used for heavier fragments; also, a sloping grating, with catch-spout and gate, intercepts and precipitates any large fragments not otherwise arrested.

Claim.—1. The suction-tube B, constructed with branches C C′ reunited in a single central passage, B′, and serving to support fan-shaft bearings D D′ external to the dust-passage, as herein set forth.

2. In combination with the suction-fan A and tube B, the tube enlargement H, catch-spout I, and gate J, substantially as herein described, for the purpose specified.

3. In combination with the elements H I J, the oblique grating K, whether hinged or otherwise.

4. In combination with the suction-fan A and tube B, the hooded and hoppered catch-box F G, constructed and operating as described, for the purpose specified.

146,116.—Car-Axle Box.—JOSEPH WHITAKER and SIMEON S. COOK, Woonsocket, R. I.; said WHITAKER assignor to said COOK. Application filed November 21, 1873.

Claim.—1. The combination of a grooved disk or collar, E, with the journal C and car-box A, provided with the rear chamber between the flanges F F, said chamber having suitable openings, at or near its lowest point, communicating with the main body of the box, all substantially as described.

2. The combination of a journal, a bell-shaped or conical collar, and a grooved disk or collar with an oil-reservoir beneath, substantially as described.

146,117.—Apparatus for Raising, Emptying, and Filling Sacks.—SAMUEL WILKERSON, Jr., Bassingbourn, England. Application filed November 7, 1873.

By means of an elevator and a tilting-frame a full sack placed upon said elevator is discharged into an empty sack placed upon tilting-frame.

Claim.—1. an apparatus for raising, emptying, and filling sacks, in which an elevator, A, is combined with a tilting-frame, B, substantially as herein set forth.

2. The combination, substantially as described, of the shaft F, the elevator A, the tilting-frame B, the cords or chains A′ and *r*, and intermediate devices, whereby the within-described movements may be transmitted simultaneously from the shaft to the said elevator and frame.

3. The combination of the lever G at the base of the elevator with the stay-frame E, or other fixed portion of the apparatus, for the purpose specified.

4. The shears I, consisting of blades *i* and *i*¹, rod or other support *j*, and connecting-link *i*², the whole being combined with the bag-elevating device, and operating substantially as herein described.

5. The frame B, pivoted to arms K K, having a limited movement, determined by stops *l l*′ on the fixed portion of the apparatus, all substantially as specified.

6. The combination, with the frame B and its projection *s*, of the sliding bar P, operated by the shaft F through the medium of a cord or chain, *r*, all substantially as specified.

7. The combination of the rounded projection *t* of the frame B with the stay E, or other fixed portion of the apparatus, for the purpose specified.

8. The combination of the rock-shafts L L′, their hooks, the arms *m m*, link *n*, handle *m*′, and spring *w*, all substantially as and for the purpose specified.

146,118.—Scroll-Saw.—JOSEPH B. WRIGHT, Jersey City, N. J. Application filed March 27, 1873.

The sawing devices are arranged to receive their movement from the foot of the operator. A boring-tool is also so arranged as to bore the holes for the insertion of the saw in inside work.

Claim.—A sawing-machine having its various parts constructed and arranged for joint operation, in the manner and for the purpose herein set forth.

146,119.—Earth-Closet.—JOHN L. YOUNG, New York, N. Y. Application filed October 19, 1872.

A movable service-pan and shutters are connected with levers in such manner that by the action of the cover the shutters are opened at the same time the pan is brought underneath the seat.

Claim.—1. The combination of the shutters F F and service-pan D, as and for the purposes described.

2. The arrangement of the bail V and cranks Y Y, in combination with the service-pan and shutters, substantially as shown and described.

REISSUE PATENTS.

5,708.—Lamp.—CHARLES F. A. HINRICHS, Brooklyn, N. Y., assignee of KATHARINA KLEEMANN, executrix of CARL A. KLEEMANN, deceased.—Patent No. 37,867, dated March 10, 1863; reissue No. 3,068, dated August 4, 1868; reissue No. 3,900, dated March 29, 1870. Application filed December 10, 1873.

Claim.—1. An argand lamp-burner in which the following instrumentalities are combined: An argand-wick, a central air-tube, a chimney-holder, a draft-regulator to determine the quantity of air passing up outside the flame, and a chimney with a contracted neck sufficiently above the wick to direct the air upon the flame independent of any metallic deflector, substantially as set forth.

2. The argand-burner, made with a spring chimney-holder below the upper end of the wick-tube and around the base of the cone, for receiving the cylindrical base of the glass chimney, the said cone being provided with openings through the same, substantially as and for the purposes set forth.

5,709.—Stove.—ELIHU SMITH, Albany, N. Y.—Patent No. 98,986 dated April 13, 1869. Application filed November 20, 1873.

The products of combustion are conducted in an annular flue around the upper part of the fire-pot, and then down to an annular sub-base flue, which makes a circuit of the stove-base. It incloses a hot-air space underneath the stove, which opens into a flue extending vertically through the fire-pot and magazine to the top of the stove. This flue has a branch flue just above the fire-pot, opening at the side.

Claim.—1. In a base-burning coal-reservoir heating stove or furnace, a flue below the ash-chamber and bottom plate of the stove, conducting the heated and escaping gaseous products of combustion in an annular circuit from the point of entrance to the point of exit therefrom, and passing them underneath the front edge or front portion of said bottom plate, in combination with an extended descending-flue for conducting said products into said base-flue, and an exit-flue for their escape after traversing said base-flue, the said descending and exit flues being arranged in proximity to each other, whereby the gaseous products conducted into the said base-flue are made to perform the entire circuit thereof, substantially as set forth.

2. In a base-burning coal-reservoir heating stove or furnace, the combination, in communication, of an annular flue surrounding an annular section of the fire-pot, a base-flue entirely below the bottom plate of the stove, and an intermediate flue connecting the said base and annular flues, substantially as set forth.

3. In a base-burning coal-reservoir heating-stove an ascending air-flue, open at the top and bottom of the stove, extending through the fire-pot, combustion-chamber, and reservoir, in combination with a branch flue, *c*, communicating with the outer air through the combustion-chamber and outer casing of the stove, said ascending flue being provided with a damper, located at a point above the point of junction of the two flues, substantially as and for the purpose set forth.

4. In a base-burning coal-reservoir heating stove or furnace, a flue for conducting air to be heated, extending up through the fire-pot into the combustion-chamber, in which latter it is exposed directly to the heat therein, and communicating with the air without the stove, through the outer casing thereof, at a point within the circumference of said chamber, substantially as set forth.

5. In a base-burning coal-reservoir heating stove or furnace, an annular arch-top combustion-chamber, in which the inwardly-inclined side of the arch forming the top of said chamber extends without the magazine-chamber, and forms a portion of the outer casing or radiating-surface of the stove, and the opposite or outwardly-inclined side of said arch reflects its incident heat-rays to the side first described, or the outer casing of the stove, substantially as and for the purpose set forth.

5,710.—Breech-Loading and Repeating Fire-Arm.—HORACE SMITH and DANIEL B. WESSON, Springfield, Mass., assignors, by mesne assignments, to WINCHESTER REPEATING-ARMS COMPANY, New Haven, Conn.—Patent No. 10,535, dated February 14, 1854; reissue No. 279, dated October 16, 1854; extended seven years. Application filed November 21, 1873.

The breech is opened, the cartridge-shell retracted and ejected, a new cartridge brought into position to be inserted into the barrel, and the piece cocked through the medium of the guard-lever.

Claim.—1. The combination of the percussion-hammer, the sliding breech-piece, and the barrel, substantially as described, whereby the breech-piece H shall serve both as a breech to hold the cartridge in the barrel, and as a means of conveying the force of the blow of the hammer to the cartridge, substantially as set forth.

2. In combination with an extractor for drawing the shell out of the chamber, a device arranged to strike the shell or cartridge and expel the same from the arm, substantially as described.

3. The combination of the sliding breech-piece H and the carrier D, constructed substantially as described, whereby the carrier can be operated while the breech is closed, and also be made to expel the shell while being raised, as set forth.

4. The combination of the hammer and the breech-piece H with the operating-lever G, whereby the hammer may be cocked by the movement of the operating-lever, substantially as described.

5. A reciprocating breech-piece arranged to move in line with the bore of the barrel, in combination with an extractor which advances from behind the cartridge to engage therewith, for the purpose of withdrawing the shell from the barrel when the breech is opened.

6. The combination, in a breech-loading arm, of a hammer, a reciprocating breech-piece, and an extractor with an operating-lever, the said parts being arranged to operate substantially as described, whereby the movement of said lever shall open the breech, cock the hammer, and withdraw the shell, as set forth.

7. The combination, substantially as described, of a barrel open at its rear end with a reciprocating breech-piece moving in line with the bore of the barrel, and an extractor arranged to advance from behind the cartridge, to engage with and extract the shell.

8. In combination with a barrel open at the rear, a device arranged to operate on the shell as it is withdrawn from its chamber, and expel it from the arm, the combination being substantially such as described.

9. The combination, substantially as described, of an operating-lever, an extractor, and a device arranged to operate on the shell after the breech is opened and expel it from the arm, substantially as set forth.

10. The combination, substantially as described, of an operating-lever with a hammer, breech-piece, and extractor, whereby the movement of the lever once forward and back will open and close the breech, cock the gun, and withdraw the cartridge-shell.

11. The combination, substantially as described, of an operating-lever with a hammer, closing breech-piece, extractor, and a device for throwing out the shell, whereby the motion forward and back of the lever will open and close the breech, cock the gun, withdraw the shell, and expel it from the arm.

5,711.—Middlings-Purifier.—EDMUND N. LACROIX, Minneapolis, Minn.—Patent No. 139,585, dated June 3, 1873. Application filed October 31, 1873.

Moving air tube or tubes, connected by flexible tubes with a blow-fan, are arranged under a screw or screws so as to concentrate a narrow blast of air upon the cloth, which keeps the meshes clean and raises the light substances to the top of the material, where they are operated upon by a suction-blast.

Claim.—1. The combination of traveling or moving air tube or tubes E E with the separator or separators B B, the said tube or tubes situated beneath the said separators.

2. In combination with the traveling air tube or tubes E E, the pipe or pipes L L, and a blower, fan, or other device for forcing air through the pipes, as herein set forth and shown, and for the purpose specified.

3. The combination, with the screws G G and with the clutch-coupling, of the rod P provided with the stops *s s*, the elbow N and lever M provided with the stops *k p*, the whole arranged and operating as herein described.

4. The combination, with a screen that has a suction-fan over it, of mechanism, substantially as described, whereby the blast from a blower-fan is made to move or travel beneath the screen, and direct the blast successively against different portions of the under side thereof.

5,712.—Heating-Stove.—EDWARD MINOAY, Boston, Mass.—Design No. 5,930, dated June 11, 1872. Application filed August 20, 1873.

Claim.—1. The design of the urn, as shown and described.

2. The design of the cast-iron top, formed and ornamented as shown and described.

3. The design of the cast-iron base, formed and ornamented as shown and described.

4. The design of the doors B and C C, formed and ornamented as shown and described.

5. The design of the top, base, cylinder, doors B and C C, and fender D, formed and ornamented as hereinbefore shown and described, in combination, as shown and described.

5,713.—Device for Clamping Whip-Sockets to Vehicles.—CHARLES B. MOREHOUSE, Newcastle, Ind., assignor, by mesne assignments, to EDWIN CHAMBERLIN and JOHN O. MERRIAM.—Patent No. 43,858, dated August 16, 1864; reissue No. 5,235, dated January 14, 1873. Application filed October 13, 1873.

Claim.—1. In combination with a whip-socket, a fastening device, having a support or bearing, E, and a movable jaw, between which the dash-rail or other part of the vehicle is received and securely clamped, for the purpose specified.

2. In combination with a whip-socket, a clamp or fastening for securing the same to the dash-rail, the parts which form said clamp being concave upon their contiguous or facing sides, and adapted by means of a screw to receive and be secured to rails of different sizes, as set forth.

5,714.—Harvester.—JAMES PIKE, Troy, N. Y.—Patent No. 33,557, dated October 22, 1861. Application filed July 13, 1872.

The front and side pieces of the main frame are constructed in one piece with the rigid cross-bar in the rear end, to which the cutter and gear-frame are pivoted.

Claim.—1. The main frame C of a harvester, having the front and sides constructed in one piece, and projecting in front and rear of the main axle, which has its bearings in holes in the frame, substantially as specified.

2. The arrangement of attached wheel and pinion G H loosely upon a prolongation of the fixed cross-bar E of main frame C, as and for the purpose set forth.

3. The gear-frame F, pivoted to fixed cross-bar E of main frame C, having finger-bar pivoted thereto, combined with a brace, I, extending from said cross-bar E, as described.

5,715.—Steam Water-Elevator.—WILLIAM E. PRALL, Washington, D. C.—Patent No. 121,962, dated December 19, 1871; reissue No. 5,138, dated November 5, 1872. Application filed November 21, 1873.

A movable partition interposed in a way or passage communicating with the interior of each chamber actuates upon an exhaust of steam from, or its condensation in, either chamber, the valve controlling the admission of steam to the two chambers.

Claim.—1. The method, substantially as herein described, of controlling the admission of steam to a double-acting steam vacuum-pump, by combining, with the steam-induction ports of the pump, a movable partition, placed in a channel of communication between its chambers, and actuated by means of an exhaust of steam through or its condensation at or within the discharge-port of either chamber, substantially as set forth.

2. A movable partition placed in a channel of communication between the chambers or cylinders of a double-acting steam vacuum-pump, and combined with a valve or valves, to control the admission of steam to said chambers, substantially as herein set forth.

5,716.—Casting Car-Wheels.—JOHN K. SAX, Pittston, Pa. Patent No. 122,536, dated January 9, 1872. Application filed April 15, 1873.

Claim.—The process of simultaneously casting the body of a car or engine wheel of one kind or quality of metal, and the tread of another kind or quality of metal, by means of a circumferential partition-band in the mold, which keeps the two metals apart while being poured, which band is left in the mold, and becomes firmly united with the metals upon both sides of it, the whole being done substantially in the manner and for the purpose described.

INDEX OF INVENTIONS PATENTED DEC. 30, 1873.

	Class No.	Whole No.
Air compressing apparatus, J. Ericsson	12	146,055
Alarm, burglar, J. J. Kane	24	146,006
Bale tie, cotton, L. Weil	7	146,037
Barrels, machine for forcing hoops on, J. Greenwood	40	145,942
Bed bottom, spring, H. A. Hight, Sr	62	146,072
Bevel rest, J. E. Seavey	29	146,027
Bit stock, L. Feely	29	146,056
Blade for agricultural implements, W. Scott	141	146,026
Boiler connection, sectional steam, J. B. Root	148	146,007
Boiler, steam, O. W. Allison	148	146,039
Boiler, wash, H. Rees	136	146,022
Boot and shoe spring shank, W. J. Neill	16	145,963
Boot and shoe uppers, machinery for crimping, C. Glantz	16	145,940
Boots and shoes, machinery for lasting, A. C. Carey	16	145,943
Bottles, tool for holding glass, T. B. Hewitt	68	145,945
Bottles, valvular stopper for, C. Patterson	1	146,018
Bridge, J. Valleiy	21	146,034
Button or stud, shirt, T. J. Holmes	23	145,948
Can for transporting oil, &c., J. E. Pimley	107	146,020
Can, oil, W. E. Hallock	107	145,999
Cane, F. Eckstein	165	146,054
Car axle box, Whitaker and Cook	122	146,116
Car coupling, T. R. Land	122	146,008
Car starter, Wallace and Andrews	122	146,112
Car ticket box, railroad, G. C. Thomas	42	146,108
Car wheels, casting, J. K. Sax, (reissue)	122	5,716
Car window screen, J. E. Earle	121	146,053
Car window shield, H. S. Hale	121	146,066
Carburetor, J. B. Lyman	27	146,082
Carpet sweeper, Palmer and Spencer	62	146,016
Carriage iron, H. K. Porter	31	146,093
Carriage top prop, W. P. Elam	31	145,935
Chair, H. S. Hale	62	146,065
Churn dasher, D. Boyd	45	145,965
Clamp for splicing broom handles, &c., C. L. W. Baker	62	146,041
Clothes frame, J. C. Miller	91	146,087
Cock with safety plugs, apparatus or, P. A. Chambeaux	64	146,045
Collar and tag cutting machine, S. S. Gray	109	145,941
Collar fastening, shirt, G. Strasser	38	145,974
Cooker, steam, J. Bentz	154	145,981
Cooler for preserving beer and wine, F. Loesch	19	145,955
Cooler, milk, R. P. Main	45	146,084
Cooler, water, W. F. Rutter	58	146,099
Copper, &c., process for the reduction of, H. Stull	99	146,031
Cotton chopper, J. M. Garrett	143	146,061
Cradle, portable, W. S. Harris	62	146,069
Cuff, E. E. Mack	38	145,957
Cultivator, wheel, W. H. Strong	43	146,030
Cultivators, insect destroying attachment for, C. T. Hurd	63	145,949
Cutter, candy, J. W. Kaskel	155	146,076
Cutter, sausage, J. Knopp	25	146,007
Desks, seat for school, J. Cooley	62	145,930
Drop light and hanger, W. Staehlen	90	146,104
Earth closet, J. L. Young	8	146,119
Eaves trough support, T. F. Morrison	126	146,014
Egg carrier, W. Wels	116	146,038
Elevator and dumper, portable, W. H. Herriott	79	146,002
Elevator, steam water, W. E. Prall, (reissue)	118	5,715
Elevator, water, D. J. McMillen	118	146,096
Engine, rotary, W. R. Manley	150	146,010
Equalizer, draft, E. H. Blake	31	145,963
Equalizer, draft, W. McClelland	31	146,011
Fats, treating animal, H. Mége	45	146,012
Fence machine, J. H. Evans	58	145,996
Ferrule, S. E. Jeralds	163	145,950
Fifth wheel to vehicles, J. R. McGuire	31	145,959
Fire arm, breech loading, G. Gundersen	18	145,998
Fire arm, breech loading, A. Henry	18	145,944
Fire arm, breech loading and repeating, Smith and Wesson, (reissue)	18	5,710
Fire bar and connecting bearing, tubular, R. J. Ellis	149	145,935
Flour packer, S. Taggart	57	146,107
Furnace, hot air, D. R. Morris	154	146,089
Furnace, portable, H. J. Lingenfelter	154	145,954
Gage, joiner's, Jennings and Arnold	29	146,075
Garden implement, J. M. Lunguest	141	146,083
Gate, farm, D. A. Neidig	52	146,015
Glove turning machine, F. Vanderpool	38	146,111
Gold leaf for bookbinders' use, manufacture of, R. E. Hastings	15	146,001
Grain cradle, D. Duecker	75	145,933
Harvester, J. Pine, (reissue)	74	5,714
Hats, machine for ironing, R. Eickemeyer	76	145,934
Heater, feed water, W. Sambrook	148	146,024
Heels, &c., machine for burnishing, G. C. Hawkins	16	145,943
Hinge for safe doors, &c., W. F. Stevens	94	145,973
Hoisting apparatus, C. R. Otis	79	146,090
Hoop lock cutter, Loggins and Wilkins	40	145,956
Illuminating apparatus, J. A. Thompson	90	146,109
Injector, S. Rue	118	145,969
Iron, &c., into ingots, working scrap, D. D. Parmelee	99	146,092
Jewelers' use, manufacture of catches for, G. H. Fuller	86	145,938
Jewelry ornaments, pin for, J. P. Courtney	86	145,990
Journal box, lubricating, J. Morin	87	146,013
Ladder, A. P. Smith	79	146,029
Lamp, C. A. Kleeman, (reissue)	90	5,708
Lantern, J. Kintz	90	146,079
Leather, composition for preserving, J. Lamplugh	92	146,080
Leather, device for trimming, W. F. Foley	92	145,937
Leather washer, annular, P. L. Gibbs	92	146,062
Lid lifter, W. Van Gaasbeek	154	146,035
Loom for weaving piled fabrics, H. Skinner	95	146,101
Loom shuttle guide, J. B. Bancroft	95	145,925
Malt drier, J. G. Schiffer	19	146,025
Marble, &c., cleaning, J. Sawyer	153	145,971
Mill spindle, J. A. Hafner	57	146,063
Mop head, Marston and Skinner	91	145,958
Mortising tool, H. K. Forbis	173	146,038
Motion, converting, W. M. Cox	67	145,931
Mug, beer, W. C. King	88	146,078
Nail extractor, G. C. Taft	84	145,975
Needle threading hook, H. Wells	104	145,978
Nubia and veil combined, J. W. Tuttle	38	145,977
Nut lock, L. Leeds	14	146,081
Nut lock, A. C. Smith	14	146,102
Nut lock, J. B. Sweetland	14	146,106
Nut lock, C. R. Watrous	14	146,113
Oakum with tar, &c., coating, J. F. Stairs	35	146,105
Oils for paints, &c., treating, D. D. Cattanach	107	146,044
Paste, broom corn seed flour for the manufacture of, J. W. Tallmadge	11	146,032
Pavement, wood, E. W. Perrin	110	146,019
Photographic monocular glass, Dallemagne and Triboulet	111	146,052
Piano pedal stool, T. Springer	109	146,103
Picker, cranberry, J. Weston	63	145,979
Picture frames, wooden mat for, H. S. Hale	54	146,067
Pin for jewelry ornaments, J. P. Courtney	86	145,990
Pipe tongs, J. R. Brown	100	145,929
Piping for buildings, system of steam and water, J. H. Mills	147	145,962
Pitman, Holly and Robertson	67	145,947
Plane, combination, A. Johnson	29	146,004
Planing machines, suction tube for, G. C. Westover	12	146,115
Planter, corn, E. C. Gage	133	146,060
Planter, corn, J. Klar	133	145,952
Plow, J. J. Mitchell	114	146,088
Press, baling, J. B. Root	7	146,096
Press, wagon hay, H. Brocksmith	7	145,986
Printing presses, apparatus for delivering sheets from, T. J. Mayall	117	146,085
Propulsion of vessels, C. P. Macowitzky	139	146,009
Pump, Barker and Mack	12	145,926
Pump, steam vacuum, Prall and Burr	118	146,095
Purifier, middlings, E. N. Lacroix, (reissue)	57	5,711
Radiator, indirect steam, J. H. Mills	147	145,961
Railway rail chair, S. Ferris	120	145,936
Railway tie, H. L. De Zeng	120	145,991
Refrigerator for slaughter houses, H. A. Roberts	58	145,968
Roof truss, P. L. Weimer	4	146,114
Rubber, hand, W. H. Blye	91	145,927
Sacks, apparatus for raising, emptying, and filling, S. Wilkerson, Jr	57	146,117
Safe and vault, J. Crump	128	146,047
Safe and vault, J. Crump	128	146,048
Sash fastener, J. D. Shewell	24	145,972
Sash holder, S. Chard	24	145,998
Saw filing machine, W. W. Parsons	131	146,017
Saw, scroll, J. B. Wright	130	146,118
Sawing machine, D. R. Pratt	130	146,021
Sawing machine, scroll, T. W. Dowling	130	145,993
Screw, wood, I. S. Russell	171	146,023
Sewing machine attachment for making button holes, J. F. Haskins	134	146,000
Sewing machine gathering and ruffling attachment, A. Johnston	134	146,005
Sewing machine tuck creaser, E. Powell	134	146,094
Sewing machines, frame for holding work on, E. M. Turner	134	146,110
Sharpening machine, J. H. Curran	70	146,050
Sharpening machine, H. B. Rorke	70	146,098
Shutter fastener, P. Keffer	24	145,951
Shutter fastening, H. A. Skinner	24	146,028
Shuttle and crochet needle, combined tatting, E. P. Kellogg	104	146,077
Sickle sections, apparatus for tempering, F. Meyer	85	145,960
Sole edge trimmer, W. Webster	16	146,038
Spinning machines, spindle whirl for, M. A. Furbush	142	146,059
Spoon, J. Hart	136	146,070
Spring, vehicle, C. W. Saladee	31	146,100
Spring for vehicle seats, C. Duecker	31	145,994
Stock feeder, U. Borel	144	145,964
Stone tool, I. Curtner	153	146,051
Stove, E. Smith, (reissue)	154	5,709
Stove damper, E. F. Cook	154	145,989
Stove, design for heating, E. Mingay, (reissue)	154	5,712
Stove leg, W. Doyle	154	145,932
Stump extractor, F. Plant	79	145,966
Sugar manufacture, H. M. Aschenbrenner	155	146,040
Teeth, filling for decayed, C. E. Blake	46	145,982
Telegraph insulator, Fox and Heston	50	145,997
Tool, compound, J. Dillon	99	145,992
Tramway plate, S. D. Tillman	120	146,031
Trap, mole, R. I. Huggins	143	146,003
Truck, Pratt and Munhall	31	145,967
Valve, B. Fitts	152	146,057
Valve, J. A. Nichols	152	145,962
Valve for steam pipes, J. W. Hodges	152	146,073
Vault cover, illuminating, J. K. Ingalls	110	146,074
Vehicle, Parmiter and Bradley	31	145,985
Vehicle holdback, Burdick and Flanders	31	146,049
Washing machine, P. Hibbs	91	146,071
Washing machine, L. Holderman	91	145,946
Washing machine, S. N. Page	91	146,091
Watch barrel, F. A. Giles	36	145,939
Water wheel, M. Chandler	168	145,947
Water wheel, J. B. Hamilton	168	146,068
Whip sockets to vehicles, device for clamping, C. B. Morehouse, (reissue)	31	5,713
Windmill, E. Crump	118	146,049
Windmill, E. Sanderson	118	145,970
Wines, manufacture of imitation medicated, V. Broseau	98	145,928
Winnower, rotary, J. H. Adamson	150	145,980
Wire stretcher, Congdon and House	52	146,046
Work holding device, F. E. Hahn	100	146,064
Wrench, J. Lee	38	145,953
Zinc, apparatus for collecting and condensing white, C. W. Trotter	35	145,976

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED DEC. 30, 1873.

	Whole No.
Adamson, J. H., Rotary winnower	145,980
Allison, O. W., Steam boiler	146,039
Andrews and Wallace	146,039
Arnold and Jennings	146,112
Aschenbrenner, H. M., Sugar manufacture	146,075
Autenrieth, G., assignee	146,040
Baker, C. L. W., Clamp for splicing broom handles, &c.	146,103
Bancroft, J. B., Loom shuttle guide	146,041
Barker, G. E., and S. F. Mack, Air pump	145,925
Belden, J. C., assignee	145,926
Bentz, J., Steam cooker	146,070
Blackburn, D. W., assignee	145,981
Blake, C. E., Filling for decayed teeth	146,102
Blake, E. H., Draft equalizer	145,982
Blye, W. H., Hand rubber	145,983
Bodine, J. F., assignee	145,927
Borel, U., Stock feeder	145,945
Boyd, D., Churn dasher	145,984
Bradley and Parmiter	145,985
Breed, G. F., assignee	145,965
Brocksmith, H., Wagon hay press	146,043
Broseau, V., Manufacture of imitation medicated wines	145,928
Brown, J. R., Pipe tongs	145,929
Brown, N. B., assignee	146,070
Burdick, H., and M. R. Flanders, Holdback for vehicles	146,049
Burr and Prall	146,047
Carey, A. C., Machinery for lasting boots and shoes	145,995
Cattanach, D. D., Treating oils for paints, &c	146,043
Chambeaux, P. A., Apparatus or cock with safety plug	146,044
Chamberlin, E., assignee, (reissue)	146,045
Chandler, M., Water wheel	5,713
Chard, S., Sash holder	145,967
Clark, P. J., assignee	145,988
Clute, P. R., assignee	146,079
Congdon, I. H., and J. E. House, Wire stretcher	145,937
Cook, E. F., Stove damper	146,046
Cook and Whitaker	145,989
Cooley, J., Seat for school desks	146,116
Courtney, J. P., Pin for jewelry or ornament	145,990
Cox, W. M., Converting motion	145,931
Craig, S. H., assignee	146,108
Crump, E., Windmill	146,049

Wright, J. B., Scroll saw 146,118
Young, J. L., Earth closet 146,119

The OFFICIAL GAZETTE of the United States Patent Office is published weekly by the Patent Office. It is printed by authority of an act of Congress, which provides for its gratuitous distribution to libraries at the rate of eight for each congressional district.

The GAZETTE contains the decisions of the Commissioner of Patents, and such decisions of the courts in patent causes as are believed to possess general interest to inventors and patentees.

During the past year a complete synopsis of foreign patent laws, prepared by members of the British Legation in foreign countries, has been printed in the GAZETTE. Also an epitome of the proceedings of the Vienna International Patent Congress, with the action of that body to perpetuate itself. Matters of this character will receive further attention in the GAZETTE.

The claims of all patents granted are printed in the GAZETTE, bearing the same date as the issue of the patent, accompanied by a brief synopsis of the invention and a portion of the drawing.

The illustrations are photographic reproductions on a reduced scale of the drawings accompanying the original application, and preserve their fidelity, which was sometimes lost undpr the old plan of drawing or tracing and engraving.

Applications for extension of patents, and the action of the Office in such cases, have their earliest publication in the GAZETTE. Disclaimers filed in the Office are nowhere else published.

Changes in the rules of practice of the Office are announced in the GAZETTE, which affords a much readier mode of communication with parties interested than to await a new edition of the Rules of Practice.

Finally, any matter believed to be of interest to inventors in their official intercourse with the Office, will receive in the GAZETTE the attention the subject warrants.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

DIGEST OF DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND

DECISIONS OF UNITED STATES COURTS

IN THE MATTER OF

PATENTS AND TRADE-MARKS.

OFFICIAL GAZETTE—July—December—1873.

DIGEST OF DECISIONS.

[The names of court cases are designated by an asterisk, (*.)]

ABANDONED EXPERIMENTS.

(See Abandonment, A 2; Priority of Invention, 3.)

ABANDONMENT.

(A) In general.

(B) Under the statute.

(A) *In general.*

1. The questions of abandonment and forfeiture, in an interference, are distinct questions; for abandonment of an invention operates in favor of the public, and forfeiture in favor of another inventor. [Hyatt *vs.* French, 609.

2. The invention described in an application for a patent which has been filed and acted on by the Office must be presumed to be complete, and cannot afterward be treated as an abandoned experiment. [R. A. Stewart, 665.

3. Mere delay in prosecuting an application which had been erroneously rejected once would not work abandonment previous to the act of 1870. [R. A. Stewart, 665.

(B) *Under the Statute.*

1. A mere agreement to transfer an invention for the joint use of the inventor and of those who advance means for working it, which was entered into more than two years before the patent was applied for, but was not consummated till within that time, will not affect the validity of the patent. [*Elm City Co. *vs.* Wooster, 83.

2. Although a single actual use of an invention for two years will work an abandonment, if it cannot be considered experimental, yet to have that effect such use must be somewhat extensive, and for the purpose of gain. [C. W. Jenkins, 351.

3. The use of an invention may be found experimental, although it was continued for six years and no alteration was made in it. [C. W. Jenkins, 351.

4. It is not a bar to an application for a patent that more than two years before it was filed other parties had obtained a patent for the same invention, and had sold it publicly, if the applicant did not know of it nor assent to it. [C. W. Jenkins, 351.

5. An invention will not be held forfeited in consequence of its having been on sale more than two years before the application was filed on which the patent issued, if within the two years the inventor had filed a previous application which described the invention, and was intended to cover it, although it was not specified in the claim in express terms. The second application will be considered a continuation of the first. [*Smith *vs.* O'Connor, 633.

AMENDMENTS.

1. The oath filed with the application refers only to the specification and drawings, and the claims cannot be amended so as to embrace a feature not shown in either of them, though contained in the model, without filing a supplemental oath. [Eaton, Bledgett, and Mills, 525.

2. Whatever is embraced in the statement of the invention, or the claims, may be claimed without renewing the oath. [Eaton, Bledgett, and Mills, 525.

APPEALS.

(See Practice, A, 2.)

ARTICLE OF MANUFACTURE.

1. A grindstone severed from the quarry by sawing instead of splitting, and afterward finished, is not distinguishable from one manufactured in the usual way, nor patentable as a new article of manufacture. [G. Hibbard, 54.

2. An article of manufacture must be new in itself in order to be patentable; it is immaterial by what art or process it is produced. [Thos. J. Mayall, 210.

ASSIGNMENTS.

1. An assignment of the full and exclusive right to all the improvements made by an inventor, as set forth in the specification of a patent, does not convey his interest in the extension of the patent. [Holmes and Spaulding, 581.

2. An assignment of all the right, title, and interest in a patent does not convey the extended term. The conveyance of it must be in express terms, and the intention to transfer it must appear from the language. [Holmes and Spaulding, 581.

(See Parties to Actions, 1, 2.)

CASES COMMENTED ON.

Ex parte Bartholomew, Commissioner's D., 1871, p. 298. [Alois Kohler, 53.

Ex parte Collender, 2 Off. G., 360. [Alois Kohler, 53.

Marble Co. *vs.* Ripley, 10 Wall, 339. [*The Singer M. Co. *vs.* Union Button Hole, &c., Co., 553.

The Nicholson Pavement Co. *vs.* Jenkins, 1 Off. Gaz., 465. [Holmes and Spaulding, 581.

R. R. Co. *vs.* Trimble, 10 Wall, 367. [Holmes and Spaulding, 581.

Eynon's case, Commissioner's Decisions, 1871, p. 229. [Lones, Vernon, and Holden, 592.

CHANGE OF MATERIAL.

(See Novelty, C.)

CHANGE OF STRUCTURE.

(See Novelty, D.)

CLAIMS.

1. An alternative claim to only one or the other of two things, but to neither positively, is void; but a claim to each of two things, whichever is used, is valid. [*The Union Paper Bag Co, *vs.* Nixon, 31.

2. Every claim in an application must in one sense cover an independent invention, yet all the claims must pertain to one common subject. [Robert M. Franklin, 165.

3. Devices exclusively adapted to operate in a given machine may be claimed by themselves in a patent for the machine. [Robert M. Franklin, 165.

4. Mechanical movements which are applicable to general use cannot be claimed, though new, in the same patent with any particular apparatus in connection with which they may be shown in operation. [Robert M. Franklin, 165.

5. A mechanism through which any rectilinear motion may be made to give rotation to two shafts in opposite directions, cannot be claimed in the same application with other new devices in a propeller in which it is employed, though claimed in combination with the parts of the propeller with which it co-operates, and with the propeller itself.

[Robert M. Franklin, 105.

6. To recite in a claim for a product the means by which it is formed is but a circuitous way of specifying its nature. It renders the claim obscure, and should not be allowed.

[Thos. J. Mayall, 210.

7. The inventor who has first discovered the advantages of employing upon wringers a well-known roll formed of fibrous material embedded in india-rubber, in which the fibers stand out in radial directions, and has reduced it to practice in one form, is not for that reason entitled to monopolize all rolls fabricated of such materials, in which the fibers stand out radially, however they may be attached, or though constructed in a different way.

[*Forsyth *vs.* Clapp, 527.

8. The word "equivalent" is eminently ambiguous in its import, and the introduction of it in a claim will seldom be otherwise than useless or mischievous.

[D. F. Haasz, 610.

9. In a claim for "a fare-box in which a channel for the downward passage of a coin or check is bounded by converging rows of independent spring-rods, or their equivalents," &c., the words "or their equivalents" refer rather to the converging rows than the spring-rods; and the examiner was sustained in requiring them to be struck out.

[D. F. Haasz, 610.

10. A patent covers only the devices which are claimed, although others are described by way of explaining them or illustrating the way in which they operate.

[*Wheeler *vs.* McCormick, 602.

11. When a patent is reissued in several divisions no one of them is void on the ground that it describes all the mechanism shown in the original, provided the claim in each is for a different device, which is clearly described, and there is no conflict between them.

[*Wheeler *vs.* McCormick, 602.

12. An inventor may claim in one patent a combination of devices when they are so connected as to operate in a certain way; and in another he may claim in combination with some of those devices another one by means of which especially the operation so described is produced.

[*Wheeler *vs.* McCormick, 602.

(See Construction of Claims.)

COMBINATIONS.

1. Where two devices, each of which has previously been used to effect a certain purpose, are combined to effect the same purpose, the combination is patentable if it is operative and new, even though it constitutes little or no improvement.

[J. M. Stone, 54.

2. To secure together by bolts the two parts of a coupling which inclosses and unites the ends of two shafts, and to place bands over the coupling which retain the bolts in their place, and give the whole a smooth exterior, while the connection is strengthened, is patentable, although the bolts and the bands have each been used before for the purpose of uniting the shafts.

[J. M. Stone, 54.

3. A combination which includes machinery and the subject upon which it operates is not patentable.

[Robert M. Franklin, 105.

4. It is no infringement of a patent for a combination which is in itself impracticable and worthless, to add to the combination an element which renders it useful and valuable.

[*Robertson *vs.* Hill, 132.

5. There is no legitimate combination between the reservoir of a fire-extinguisher and the fluid it is intended to contain, unless they are especially adapted to each other.

[Barker and Mack, 155.

6. A claim should not be allowed for a combination of elements, no one of which is novel in itself, or produces any new effect upon the action of either of the others.

[B. S. Baker, 156.

7. To render a combination legitimate the constituent parts must produce some new operation in consequence of their being so arranged together, or some one of them must be novel in itself, and render the whole capable of producing a new result.

[B. S. Baker, 156.

8. A claim for saw-filing clamps and saw-setting tools, arranged independently upon a portable bench, held not to cover a combination of tools or machines.

[B. S. Castle, 179.

9. Such an assemblage of parts also held not to constitute a single patentable article or "kit," because the mere convenient assemblage of different and independent devices upon the same platform does not constitute invention.

[B. S. Castle, 179.

10. An assemblage of distinctive individual parts which is less than a combination of them falls short of invention.

[B. S. Castle, 179.

11. The relative functions of parts are to be kept in view in questions of this nature.

[B. S. Castle, 179.

12. The difference between a mere unpatentable assemblage of parts and a combination of them, in a legal sense, illustrated.

[B. S. Castle, 179.

13. Machinery for forming and completing a carriage-axle, and distinct machinery for polishing it after it is completed, cannot be treated as a combination nor considered under one application.

[Lones, Vernon, and Holden, 582.

14. Where two machines produce a result when they operate in conjunction, which they could not accomplish by their independent and disconnected action, they may be embraced in one patent as a combination.

[Lones, Vernon, and Holden, 582.

15. A combination may be patentable on account of the novelty of the arrangement, although all the elements are old.

[*Westlake *vs.* Carter, 636.

16. A patent for a combination is not infringed unless all the elements enumerated are used, or the equivalents of those which are omitted are substituted for them.

[*Westlake *vs.* Carter, 636.

17. To show that the parts omitted by the defendant from a patented combination are unessential will not render him liable as an infringer for the use of the rest.

[*Westlake *vs.* Carter, 636.

(See Construction of Claims, 4; Infringements, 6, 14; Novelty, B, 4.)

COMMISSIONER.

The authority of the Commissioner to require applications to be divided, so as to conform to the classification of subjects adopted by the Office, does not extend to all cases.

[Robert M. Franklin, 105.

CONSTRUCTION OF CLAIMS.

1. A claim for "a rotary blowing-case having concave arcs, in combination with end plates arranged so as to admit of the abutments being introduced or removed without requiring the case to be taken apart," held to mean so much of the case as incloses the operative parts, and that it was infringed by a case cast in two parts, of which one included only the legs and such portions as performed none of the functions of the machine, and on removing it the abutments could be introduced or removed.

[*Roots *vs.* Hyndman, 29.

2. Claims which can be construed to embrace meritorious combinations and devices will not be construed to embrace a principle, and to be therefore void, though they are capable of being so interpreted.

[*The Union Paper Bag Co. *vs.* Nixon, 31.

3. Where the bar on which the tube is supported in a paper-bag machine has the lower side extended beyond the upper, so that the lower side of the tube will be cut off with a lap to form the bottom of the bag, a claim for a combination of several of the devices employed, which enumerates among the rest "machinery for cutting the tube slantwise, as specified, while it is on the former or holder, and machinery for pasting or cementing the said tube near its front end, and bending or lapping the end of the tube on the cemented part so as to form the bottom of the bag," was held to embrace the extension of the lower side of the bar.

[*The Union Paper Bag Co. *vs.* Nixon, 31.

4. A claim for "arranging the pitch-line of the feeding-gear in, or about in, the prolongation of the axis of the shaft of its crank, whereby we obtain intermittent and variable motions of the paper, as described," held to be a combination claim, and to include the roller which works in the supporting-bar and the devices for carrying forward the paper, and giving it tension while it is severed, though they are not specified.

[*The Union Paper Bag Co. *vs.* Nixon, 31.

5. Although the claim, in a patent in which a roll formed of fibrous material embedded in india-rubber with the fibers standing out in radial directions is described, may be expressed in terms so broad as to cover all such rolls with radial fibers, the court will look into the specification and restrict the claim to what is there shown; and if the patent be a reissued one, they will also look into the original specification for the same purpose.

[*Forsyth *vs.* Clapp, 527.

6. A claim for "a receiver for pan water-closets formed and constructed so that the side A D, into which the pan C swings for emptying, will conform to the shape of the pan," &c., held, on comparing it with the specification, to be a claim not merely for a conformity, but for a conformity attained by specified means, and to be valid.

[*Smith *vs.* O'Connor, 633.

7. Held, also, on a like comparison with the specification, that the claim was not too broad.

[*Smith *vs.* O'Connor, 633.

(See Claims, 8; Combinations, 8.)

CONSTRUCTION OF SPECIFICATIONS.

(See Construction of Claims.)

CONTINUING APPLICATIONS.

(See Abandonment, B, 5.)

CORPORATIONS.

A corporation may maintain a suit in the district where its rights are infringed, although it was created under the laws of a State without the district.

[*Elm City Co. *vs.* Wooster, 83.

COSTS.

(See Infringements, 17; Pleadings and Practice, 3.)

DAMAGES.

If the patentee is engaged in manufacturing the patented article for sale, his damages will be manufacturer's profits.

[*Westlake *vs.* Carter, 636.

DESIGNS.

1. A patent will not be granted for a design which is shown in the drawings annexed to a patent already issued for a machine, although the machine or design may either of them be used without the other.

[Alois Kohler, 53.

2. Although the grantee of the machine patent is the applicant for the design patent, he should be denied in such a case.

[Alois Kohler, 53.

3. If the patentee of a machine discloses in his specification his intention of obtaining a patent for the design shown in his drawings, it seems that he might then obtain such a patent.

[Alois Kohler, 53.

4. A single design patent should not be granted for two articles which are not ordinarily used together.

[Bloomfield Brower, 450.

5. Nor where their relative positions are liable to be varied when used together.

[Bloomfield Brower, 450.

6. An inkstand and its stopper do not together form a legitimate subject for a design patent.

[Bloomfield Brower, 450.

7. The law authorizing the granting of patents for designs contemplates such articles only as are intended for ornament or decoration.

[C. A. Seaman, 691.

8. The utility of an article may constitute a claim for a design patent, but not unless its utility is that of ornamental form and appearance, and it is employed merely for decoration.

[C. A. Seaman, 691.

9. If the only merit which can be attributed to the form of an article is due to its mechanical operation it can be patented only as a mechanical invention.

[C. A. Seaman, 691.

DILIGENCE IN PROSECUTING INVENTIONS.

(See Priority of Invention, 3.)

DIVISION OF PATENTS.

(See Joinder of Inventions.)

DRAWINGS.

(See Reissues, 5.)

DOUBLE USE.

(See Novelty, B.)

EQUIVALENTS.

(See Infringements, 1, 3, 4, 15; Novelty, D, 5.)

EVIDENCE.

(See Pleadings and Practice, 4, 5, 6, 7; Priority of Invention, 6.)

EXAMINER OF INTERFERENCES.

1. The Examiner of Interferences has no authority to decide upon the novelty of the devices in controversy before him. The primary examiner and the appellate tribunals alone possess that jurisdiction.

[Neubocker *vs.* Schafhaus, 319.

2. If it appears to the Examiner of Interferences that the novelty of the devices in interference has not been sufficiently investigated, or when a new reference has been discovered, he should suspend the interference.

[Neubocker *vs.* Schafhaus, 319.

EXPERIMENTAL USE.

(See Abandonment, B, 2, 3.)

EXTENSIONS.

(A) In general.
(B) As to novelty and utility.
(C) As to value and importance.
(D) As to remuneration.
(E) As to diligence.

(A) *In general.*

(See Assignments, 1, 2; Joint Inventors, 5, 6; Practice, B.)

(B) *As to novelty and utility.*

1. An applicant for an extension will not be required to erase from his specification the description of an invention, which he uses but does not claim, at the demand of a remonstrant who has a patent for the invention, and who apprehends that the applicant may set up a title to it on a reissue. The applicant has a right to apply for a reissue, and to have the question tried on an interference.

[M. P. Norton, 156.

2. A patent granted December 6, 1859, upon an application filed February 27, 1851, is a bar to the extension of a patent for the same device granted January 11, 1859.

[R. A. Stewart, 665.

(C) *As to value and importance.*

In an application for the extension of a patent it is not sufficient, in order to establish the value or importance of the invention, to show that of a more extensive process and a larger machine in which the invention was embodied.

[F. P. E. Carré, 180.

(D) *As to remuneration.*

If an invention is an obvious one and sure to be devised in a short time, the first one to produce it does not seem to be entitled to the same remuneration for it, however great the benefits resulting from it, as the inventor of an improvement less likely to be discovered.

[M. P. Norton, 156.

(E) *As to diligence.*

If neither the patentee nor any one else has ever employed the materials designated in his patent for the purpose intended, yet

if his assignees have employed the equivalents of them he cannot be charged with want of diligence.

[T. J. Mayall, 582.

FORFEITURE.

(See Abandonment, A, B; Priority of Invention, 7, 8, 9.)

INFRINGEMENTS.

1. A patent for a rotary blower-case, of which the interior and certain specified parts are rendered true by means of plaster-of-paris "or its described equivalent," and which describes as an equivalent such materials as are capable of being made plastic when applied, and becoming hard in a suitable time, is infringed by the use of litharge and glycerine for the same purpose.

[*Root *vs.* Hyndman, 29.

2. A claim for a combination of several devices employed in a paper-bag machine, including a bar on which the paper tube was supported, having the lower side extended beyond the upper, so that the lower side of the tube will be cut off with a lap to form the bottom of the bag, and also machinery for cutting the tube slantwise, as specified, and machinery for pasting or cementing the tube, &c., is infringed by the use of such a supporting-bar, although turned upside down, and made with its rear end smaller than the rest, and without the cutting-edges or the rollers that carry forward and paste the paper.

[*The Union Paper Bag Co. *vs.* Nixon, 31.

3. A patent for making the frame of a paper-bag machine adjustable upon its bed by means of a slot and screw, is infringed by making the frame so heavy as to be held in place by its weight.

[*The Union Paper Bag Co. *vs.* Nixon, 31.

4. A claim for creasing-rollers in a paper-bag machine, in combination with other devices, is infringed by rounded bars or hooks working in a similar combination with the same effect.

[*The Union Paper Bag Co. *vs.* Nixon, 31.

5. Paint-cans with one end made wholly of tin, which can be easily cut through, held to be an infringement of a patent for a paint-can, the top of which is extended and united to the sides by a disk-ring of brass, and which can be readily opened by cutting through the brass.

[*Masury *vs.* Anderson, 55.

6. The unauthorized use of a combination which operates upon the same principle with one that is patented is an infringement of the patent, although in the place of some of the constituent devices others are substituted which were known to be the equivalents of them when the patent was issued.

[*King *vs.* The Louisville Cement Co., 481.

7. Although the patent in suit contains nothing inconsistent with the claims set up in a later patent, yet a machine constructed in accordance with the later patent may be an infringement of the former.

[*Bachelder *vs.* Moulton, 501.

8. The defendant's sewing-machine being found to contain several devices embraced in the plaintiff's patent was held to be an infringement, although the feeding is always effected by the same part of his feeding-bar, while different portions of the plaintiff's feeding-cylinder operate at different times.

[*Bachelder *vs.* Moulton, 501.

9. It was also held to be an infringement although the defendant's feeding device is always in contact with the material, and that in the patented machine is not.

[*Bachelder *vs.* Moulton, 501.

10. Neither will the substitution of a roughened surface on the feed for holding the material in lieu of impaling-pins relieve from the charge of infringement, although the change allows the material to be turned, and a curved seam to be produced.

[*Bachelder *vs.* Moulton, 501.

11. A roll for a wringer consisting of fibrous material, of which the fibers are looped about a wire wound tightly around the shaft, and the ends stand out from the shaft in a radial direction, the whole being embedded in india-rubber, which is thereby attached to the shaft, is not an infringement of a patent for a similar roll, in which the fibers also stand out radially, but in curved directions, and are attached to the shaft only by means of the rubber in which they are embedded.

[*Forsyth *vs.* Clapp, 527.

12. Where two patents have been granted for articles which resemble each other a presumption arises from the action of the Office that there is such a difference between them that the use of one constitutes no infringement of the patent for the other.

[*Smith *vs.* Woodruff, 635.

13. If one paper-file holds the paper better than another which is patented, and has driven it out of market, that is *prima-facie* evidence that the mechanism is different, and is a new invention, and that the use of it does not violate the patentee's monopoly.

[*Smith *vs.* Woodruff, 635.

14. A patented combination may be used without infringing the patent if one of the elements of the combination is omitted, although another is substituted in its place which is new, or performs a substantially different function, or if it was not known as a proper substitute when the patent was issued.

[*Smith *vs.* Woodruff, 635.

15. A device is the equivalent of one that is patented if it performs substantially the same function in the same way, and produces the same result, though it may be of a different form and bear a different name; and the use of it will be an infringement.

[*Westlake *vs.* Carter, 636.

16. A patent for a carriage-wheel in which the spokes have tenons inserted in the hubs, and are sustained against pressure endwise by the shoulders of the tenons, and laterally by collars on each side bolted together, is infringed by a similar wheel in which the spokes are made tapering without shoulders, and enter into corresponding mortises in a solid collar and in the hub, and are sustained endwise on the inclined sides of the mortises.

[*Sarven *vs.* Hall, 666.

17. The defendants were led into adopting this form in consequence of their employment of the shoulders having been urged by the patentee's counsel in a former suit as constituting the breach of the patent; and though an injunction was ordered against them, it was without costs.

[*Sarven *vs.* Hall, 666.

18. Although a patent has expired and the device covered by it can be used only in connection with other devices embraced in a patent still in life, the latter devices cannot be used without the consent of the patentee, even in connection with the first.

[*Wheeler *vs.* McCormick, 692.

(See Combinations, 4, 16, 17; Construction of claims, 1; Parties to Action, 4.)

INJUNCTIONS.

1. The Court will seldom hear any evidence, except on the question of infringement, upon a motion for a preliminary injunction, if the patent has been sustained in three previous cases, especially when the defendant was interested in the defense of one of them.

[*Robertson *vs.* Hill, 132.

2. The complainant having been long in the enjoyment of his patent, a preliminary injunction was ordered restraining the defendants from infringing it, notwithstanding affidavits were filed showing that articles embodying the alleged invention had been in use before the complainant made it, there being evidence to the contrary, and none of the articles being produced.

[*Chase *vs.* Wesson, 476.

3. Although courts of equity will not ordinarily, even where the title is clear, disturb the existing order of things by an injunction, they will interfere to preserve them in that condition until the rights of the parties are ascertained, notwithstanding some doubts may rest upon them, provided they are in the course of being judicially determined.

[*The Singer M. Co. *vs.* Union Button Hole, &c., Co., 553.

4. While the courts will not enjoin the specific performance of a contract when they can exercise no supervision over it, or when it would force upon an employer a servant personally objectionable to him, they will nevertheless restrain the parties from any action infringing the contract.

[*The Singer M. Co. *vs.* Union Button Hole, &c., Co., 553.

5. An injunction against trespassing upon an exclusive license to sell a patented article may be granted against parties who are not bound by the contract, or who have no notice of it.

[*The Singer M. Co. *vs.* Union Button Hole, &c., Co., 553.

6. Where one party to a contract has already received a benefit from the performance of it by the other, he will be restrained from violating it, although the other is not bound by it.

[*The Singer M. Co. *vs.* Union Button Hole, &c., Co., 553.

7. Where a corporate body had given the plaintiffs an exclusive license to sell machines embodying inventions of which it held the patents, and had agreed to furnish the machines at a stipulated price, it was prohibited from taking measures to dissolve its organization, and its assignee of the patents in trust for a new association was prohibited from disposing of them.

[*The Singer M. Co. *vs.* Union Button Hole, &c., Co., 553.

8. But the corporation was not decreed to perform the contract.

[*The Singer M. Co. *vs.* Union Button Hole, &c., Co., 553.

INTERFERENCES.

(See Practice, C.)

INVENTION.

(See Invention and Skill; Subjects of Patents.)

INVENTION AND SKILL.

1. Stone has usually been quarried by sawing or cutting, or by splitting where the texture permitted and the stone was of little value, and it is a mere matter of judgment which mode shall be adopted.

[G. Hibbard, 54.

2. It is not patentable, therefore, to sever grindstones from the quarry by sawing, and then to finish them by turning and eyeing them, instead of first splitting them out as usual.

[G. Hibbard, 54.

3. An ordinary paper bag used for sacking brooms cannot be claimed as an invention independent of the process of sacking.

[Charles H. Toll, 500.

4. Although an inventor is ignorant of the practice and operation of the ingredients by which he accomplishes his object, yet if he discovered them while endeavoring to accomplish it, his achievement is not to be reckoned an accident to the prejudice of his patent.

[T. J. Mayall, 582.

(See Combinations, 9, 10; Novelty C, 3, 4; Novelty D, 10, 11.)

JOINDER OF INVENTIONS.

1. A claim for a peculiar fluid to be used in a fire-extinguisher cannot be embraced in a patent for the instrument, but it must be covered by a separate patent.

[Barker and Mack, 155.

2. An inventor may have distinct patents for several distinct devices, although he might have included them all in one, making a separate claim for each device.

[Wheeler *vs.* McCormick, 692.

(See Combinations, 13; Commissioner; Patents, 1, 2; Reissues, 3, 4.)

JOINT INVENTORS.

1. Where two persons have taken out a patent as joint inventors each of them seems to be estopped from setting up a claim that he is the sole inventor, so long as the other denies it.

[Chase *et al.* *vs.* Chase, 4.

2. If such a claim can be entertained at all it must be established by conclusive proof.

[Chase *et al.* *vs.* Chase, 4.

3. If one originates the general idea of an improvement, and another aids him in developing it and reducing it to a practical form, they may be considered joint inventors.

[Chase *et al.* *vs.* Chase, 4.

4. Where one person invented one part of a machine and perfected another part after a second person had suggested it, and both united in elaborating the whole and reducing it to form, the second was held not to be the sole inventor.

[Chase *et al.* *vs.* Chase, 4.

5. The extension of a patent issued to two joint inventors will be denied if one of them has since deceased, and his representative not only refuses to join in the application, but protests against its being allowed.

[J. B. Wickersham, 155.

6. A patent issued to two joint inventors cannot, it seems, be extended upon the several application of one of them.

[J. B. Wickersham, 155.

JURISDICTION.

(See Commissioner; Examiner of Interferences, 1.)

MANUFACTURES.

(See Articles of Manufacture.)

MODELS.

(See Amendments, 1; Reissues, 7.)

NOTICE OF DEFENSE.

1. It is not sufficient to give notice of special matter of defence in an action upon a patent thirty days before the trial; it must be given thirty days before the first day of the term.

[*Westlake *vs.* Carter, 636.

2. Such notice need not specify the particular portion of the plaintiff's patent to which the evidence applies.

[*Westlake *vs.* Carter, 636.

3. Patents may be given in evidence to show the state of the art without such notice; but printed publications cannot be.

[*Westlake *vs.* Carter, 636.

(See Pleadings and Practice, 2.)

NOVELTY.

(A) In general.

(B) In the application.

(C) In the material.

(D) In the structure or process.

(A) *In general.*

1. The results accomplished by an invention are more to be relied upon in determining the question of its novelty than a consideration of the steps by which it was arrived at, although it is well to take them also into account.

[T. N. Foster, 377.

2. If better results are obtained through the use of different means, it is a sure test of invention when neither the results nor means are frivolous or insignificant.

[Orison Underwood, 449.

(See Designs, 1, 2, 3; Infringements, 12, 13; Novelty, D, 8; Priority of Invention, 2.)

(B) *In the application.*

1. Although a combination of an endless apron and a delivery-head composed of three rollers has been employed in preparing cotton for spinning, it is patentable to employ a like combination in preparing wool for spinning, since it required a special adaptation of the drawing-head for that purpose.

[J. and J. Dobson, 499.

2. It is common to adjust the height of parts of machinery by providing holes into which the bolts may be inserted by which they are suspended, and to adjust the height of the pressing-box in a machine for sacking brooms by these means is not patentable.

[Charles H. Toll, 500.

3. If a tube has been formerly prepared from fibrous material and india-rubber in a certain manner, and cut into rings for stuffing-boxes, to use similar tubes upon shafts for the rolls in a wringing-machine does not entitle any one to monopolize them as his invention.

[*Forsyth *vs.* Clapp, 527.

4. But he may have a patent for the combination of a tube thus constructed with the shaft, although united in the same way that tubes and shafts have been before united for the same purpose, provided new results have been thereby effected.

[*Forsyth *vs.* Clapp, 527.

(See Novelty, C, 2.)

(C) *In the material.*

1. A patent for a rotary blower-case of which the interior and certain other parts are rendered true by means of plaster-of-paris, &c., is not impeached for want of novelty because a pump lined with molten metal was before known.

[*Roots *vs.* Hyndman, 29.

2. Nor because others have, by means somewhat similar, made the abutments in such a machine true, those not being specified in the claims.

[*Roots *vs.* Hyndman, 29.

3. When material advantages have resulted from the substitution of paper for metal in the fabrication of any article, there arises a presumption, in view of the different qualities of the two materials, that invention has been exercised.

[P. M. J. Chamblant, 106.

4. But spools having been previously manufactured from paper, it is not patentable to make bobbins from that material in the same form in which bobbins have been made from metal.

[P. M. J. Chamblant, 106.

(D) *In the structure or process.*

1. An application claiming the rolling of tubes without a mandrel from a hollow fagot composed of layers of bars riveted together, is answered by a patent describing the same process, except that it does not mention how the bars are attached together, that being a requisite which every mechanic would supply without its being specified.

[E. Wheeler, 3.

2. A patent for a paint-can, the top piece of which is extended and united to the sides by a disk-ring of brass, and which can be

opened readily by cutting through the brass, is not void for want of novelty, because milk-cans have been known with their sides carried up and united to the top by a tube-ring of lead, capable of being easily severed for the same purpose.

[*Masury *vs.* Anderson, 55.

3. Nor on account of cans for holding potash made of tagger's iron, nor of such cans made with heads and bottoms of tin not intended to be opened by cutting.

[*Masury *vs.* Anderson, 55.

4. A seal-lock in which the bow and seal must be locked by separate movements has merit as an improvement, although a lock has been patented in which both were locked by one movement, but the seal might be released in locking the bow.

[Thos. Slaight, 82.

5. A screw which is rotated in a stationary nut by means of a spur-wheel upon the screw gearing with another, and which is thereby made to move longitudinally, is but the equivalent of one to which, while it is prevented from turning, a like movement is imparted by a nut made to rotate upon it by means of a pulley placed upon the nut and belted to a drum.

[*King *vs.* The Louisville Cement Co., 181.

6. A mowing-machine with "an independently-vibrating cutter-frame" which is raised by a chain that obviates the side draft, yet still allows the cutter-bar to vibrate, is not anticipated by one in which the cutter-frame is rigidly attached to the tongue-frame, and when raised by a similar chain the driving-wheel is also raised from the ground, and is no longer operative.

[T. N. Foster, 377.

7. If a syringe has been previously known having a bulb with a screw upon it, by which a flexible tube could be attached to it, it is fatal to a patent which claims "so forming the connection between the bulb and its flexible tube that the bulb can be used separately with a jet-pipe, as well as with its flexible tube, thus adapting the syringe to all the various operations for which it may be required, as described."

[*Richardson *vs.* Lockwood, 398.

8. Even if those who made the prior syringe never thought of attaching a jet-pipe to the bulb, that will not avail to save the patent.

[*Richardson *vs.* Lockwood, 398.

9. To extend the outsole of a boot into the heel, instead of having it terminate at the heel, and to place the heel-plate between it and the insole, constitutes an invention.

[Orison Underwood, 449.

10. A railway-conductor's ticket-book having been prepared with symbols which when punched out indicated certain facts, adding more symbols of the same kind to indicate, when punched out, further facts, requires no invention.

[Samuel S. McNaughton, 525.

11. Where the book had been prepared with duplicate leaves, which were to be punched together, and were so attached at one side and one end that one was detachable, to prepare such a book, with the duplicate leaves thus attached at both ends, merits no reward.

[Samuel S. McNaughton, 525.

12. A metallic button-hole for suspenders formed with a link to hold the strap, and an aperture at right angles to it through which the button is inserted, with enlargements on the sides for passing the eye, is not now or patentable, in view of a like device before known, having an aperture for inserting the button parallel to the link, with an enlargement on the under side for passing the eye.

[*B. J. Greeley, 612.

13. Such merely structural modifications which do not change the operation of a device are not patentable, though they produce a better result, if the result be of the same kind.

[*B. J. Greeley, 612.

(See Combinations, 1, 2.)

PARTIES TO ACTIONS.

1. A patentee may maintain a suit at law upon his patent in his own name, although he is under a contract to assign it to others, if the contract has not been executed.

[*Wheeler *vs.* McCormick, 692.

2. But equity regards that as already done which the patentee has agreed to do, and requires that the proposed assignees be made parties to a bill in chancery brought against infringers.

[*Wheeler *vs.* McCormick, 692.

3. If the other parties to such a contract release to the patentee all their interest in the patent, he may maintain a bill in his own name for all subsequent infringements, but not for those committed previous to the release.

[*Wheeler *vs.* McCormick, 692.

4. Neither can he recover damages for any infringements committed after he has sold and assigned the patent.

[*Wheeler *vs.* McCormick, 692.

PATENTABILITY.

(See Patents, 3.)

PATENTS.

1. The exclusive privilege of fabricating out of sheet metal nails corrugated lengthwise may be secured to the inventor by a single patent.

[Barak T. Nichols, 105.

2. He need not divide his application, and apply for a separate patent for each form of nail which he shows by way of illustration in his specification.

[Barak T. Nichols, 105.

3. Other forms of such nails, if they possess the necessary requisites, may also be protected by subsequent patents, but they will be subordinate to the one first obtained.

[Barak T. Nichols, 105.

(See Claims, 10, 11, 12; Joinder of Inventions.)

PLEADINGS AND PRACTICE.

1. Testimony as to the prior knowledge and use of the invention by persons not named in the answer will be considered on the hearing, if no motion is then made to strike it out, although it was objected to when it was taken.

[*Elm City Co. *vs.* Wooster, 83.

2. Evidence of the prior use of the patentee's invention given by a witness who was not referred to in the answer, excluded from consideration, although it might be said that it showed the state of the art.

[*Richardson *vs.* Lockwood, 398.

3 Although a bill for restraining the infringement of a patent is dismissed, the defendant will be allowed no costs if the rights of the parties are thereby settled, and a benefit consequently results to him as well as the public.

[*Smith *vs.* Woodruff, 635.

4. The proceedings in the Patent Office upon the plaintiff's application for the patent are not admissible for the purpose of giving it a different construction.

[*Westlake *vs.* Carter, 636.

5. If the defendant claims that the patent is void for uncertainty it rests with him to establish the charge.

[*Westlake *vs.* Carter, 636.

6. If the defendant has a patent it is evidence of the opinion of official experts that it does not conflict with the plaintiff's patent, and that in working under it he is guilty of no infringement.

[*Westlake *vs.* Carter, 636.

7. Such evidence will be submitted to the jury; the court will not compare the patents.

[*Westlake *vs.* Carter, 636.

8. The pendency of a suit upon a patent in one district is no bar to the prosecution of a suit upon it in another, whatever may be the effect of a recovery in such foreign suit.

[*Wheeler *vs.* McCormick, 692.

(See Damages; Injunctions; Notice of Defense; Parties to Action.)

PRACTICE.

(A) In general.

(B) In extensions.

(C) In interferences.

(A) *In general.*

1. It is incumbent on the Examiners-in-Chief and the Commissioner, as well as on the Examiner, to communicate to an applicant the grounds upon which he has been rejected.

[P. M. J. Chamblant, 106.

2. Unless the Examiner in charge has acted upon an amendment, no appeal can be taken from him to the Commissioner under the 44th rule.

[Barker and Mack, 155.

3. Before determining whether an application shall be divided, the claims should be couched in such terms as to place their meaning beyond all doubt.

[Thos. J. Mayall, 210.

(See Amendments 1, 2; Commissioner.)

(B) *In extensions.*

1. It has become an established practice to grant extensions where there are no other objections to it except defects in the patent, which may be corrected on a reissue.

[T. J. Mayall, 562.

(See Extensions B, 1, C; Joint Inventors, 5, 6.)

(C) *In interferences.*

1. Where two conflicting applications are pending in the Office at the same time, and a patent is issued upon one by mistake without declaring an interference between them, the rights of the parties will be determined on the same ground as if both were applicants; the one who has obtained a patent will derive no advantage from it in the controversy, neither will the other be prejudiced by it.

[Brookfield and Hemingray *vs.* Brooke, 81.

2. Where anything is developed on an interference which renders it doubtful whether the invention is novel, the case will be remanded to the Examiner in charge, in order that, with the further light thus obtained, he may investigate the question anew.

[Wood *vs.* Morris, 131.

3. Upon a declaration of interference between an application and a patent, the applicant amended his specification by withdrawing several claims which were not in conflict with the claims set up in the patent, but were confessedly subordinate to them, and filed another application embracing them, and obtained a patent for them: *Held*, that, although he described the disputed inventions in his patent, it was not necessary that he should ask for a reissue claiming them, nor that the interference should be dissolved to be renewed with the application for a reissue when filed.

[Lacroix *vs.* Welch, 526.

4. *Held*, that a disclaimer should be filed of the devices so described but not claimed, with the statement that they were embraced in another application.

[Lacroix *vs.* Welch.

(See Examiner of Interferences, 1, 2.)

PRIORITY OF INVENTION.

1. The party who first conceived an invention, and made drawings of it, and endeavored to induce manufacturers to adopt it and introduce it, without whose aid it could not be done, held to be the prior inventor, although his competitor, being a manufacturer himself, was enabled thereby to anticipate him in introducing it into use.

[Brookfield and Hemingray *vs.* Brooke, 81.

2. Priority awarded to an applicant who claimed a block of wood fastened between a stationary frog and the adjacent rails, and who had reduced the invention to practice, over the patentee of a special form of block to be placed between the frog and the rails, which he said incidentally in his specification might be of iron or wood, but who made no allusion to the superior qualities of wood for the purpose, and who had never used it.

[Wood *vs.* Morris, 131.

3. If an inventor, after making two secret experiments, takes no further steps with his improvement for five years, when he applies for a patent, and another has meanwhile reduced it to practice and put it in the market, what the first has done will be regarded as abandoned experiments, and the other party will be adjudged the prior inventor.

[Lippman *vs.* Marchant, 390.

4. The applicant who first produced a perfect-working specimen of the invention in dispute, adjudged the prior inventor, although another had conceived it before him and made a drawing of it, which he had explained to another person, but had shown no diligence in reducing it to practice.

[Davis *vs.* Edson, 500.

5. The patent for extinguishing fire in oil-tanks by covering the oil with carbonic-acid gas, introduced beneath and allowed to rise to the surface, awarded to the party who first effected it by mixing in the tank under water the chemical re-agents for forming the gas, although his competitor afterward anticipated him in the better method of forcing the gas from a reservoir outside into the oil.

[Stanton *vs.* Perley, 500.

6. Upon an interference between an application and patent there is a *prima facie* presumption that the patentee is the prior inventor.

[Paul *vs.* Dorland, 552.

7. An inventor, through want of diligence in the reduction of his invention to practice, may forfeit whatever right he may have thereto to another independent and more diligent inventor of the same thing.

[Hyatt *vs.* French, 609.

8. In a controversy between two independent inventors, where it appeared that one was first to conceive an invention and construct a device embodying it, but rested for twelve years before attempting to use the invention or apply for a patent for it, and in the interim the other invented, perfected, patented, and largely introduced the invention: *Held*, that the latter was, in contemplation of law, the prior inventor.

[Hyatt *vs.* French, 609.

9. Although a third party had conceived of the invention before the plaintiff, and had made some progress toward completing a model, yet, if he then suspended his labors, and, before he resumed them, the plaintiff had perfected the invention and had embodied it in a practical working machine, his patent will be sustained.

[*Smith *vs.* O'Connor, 633.

(See Joint Inventors, 4.)

REDUCING TO PRACTICE.

(See Priority of Invention, 1.)

REISSUES.

1. In the reissue of a patent for a medical inhaler, it is proper to specify in what parts of it two medicated liquids shall be placed when two are used, although it was not mentioned in the original.

[N. I. Donaldson, 4.

2. Such an explanation is in fact required by section 26 of the act of 1870.

[N. I. Donaldson, 4.

3. Such combinations of the parts shown in a patented machine as are operative in themselves, and constitute distinct and separate parts of the thing patented, may be embraced in separate divisions upon a reissue of the patent.

[Wheeler and Wheeler, 5.

4. But several parts of a patented machine which will together constitute a new invention not hinted at in the original, cannot be selected and claimed by themselves on a reissue.

[Wheeler and Wheeler, 5.

5. Drawings of bags, the forms of which were indicated in the patent of a paper-bag machine by which they are produced, may be annexed to a reissue of the patent, although they were not to the original.

[*The Union Paper Bag Company *vs.* Nixon, 31.

6. Upon an application for the reissue of a patent for a fire-extinguisher no amendment should be allowed which introduces the formulas for preparing the fluid to be used when there was no indication of the formulas in the original.

[Barker and Mack, 155.

7. A specimen of carbolised hose accompanying an application is not such a model as will, upon a reissue of a patent for a process for producing such hose, prevent inserting the description of an antiseptic which was not named in the original, but is shown to have been embraced in the invention.

[T. J. Mayall, 562.

(See Claims, 11; Practice, B.)

RENEWING OATH.

(See Amendments.)

SKILL AND INVENTION.

(See Invention and Skill.)

SPECIFIC PERFORMANCE.

(See Injunctions, 4, 8.)

SPECIFICATIONS.

1. A specification is not fatally defective because it does not mention such modifications as practical use would readily suggest in order to render the machine efficient, such as employing a weight or a spring, or changing the dimensions of the parts.

[*The Union Paper Bag Company *vs.* Nixon, 31.

2. Nor because it does not mention a cam on the main shaft, and the arms and connecting-rod, which are all necessary to give the proper reciprocating movement to the pasting-rollers on a paper-bag machine, they being devices which any mechanic would introduce of his own accord.

[*The Union Paper-Bag Co. *vs.* Nixon, 31.

3. Nor because the office of giving motion to the pasting-rollers is assigned to another cam on the shaft, which is incapable of performing it, since any mechanic would know that another cam is necessary for the purpose, as well as its form, and where it should be placed.

[*The Union Paper-Bag Co. *vs.* Nixon, 31.

4. A patent for a hand-stamp is not to be impeached on the ground that the stamp cannot be made to operate successfully

without an inking-ribbon, which is not noticed, if it mentions that the stamp may be used with any suitable inking device, and such inking-ribbons were well known at the time.

[*Robertson *vs.* Hill, 132.

5. There is no particular word or phrase of which the Office will prohibit the use in a specification; yet it will not allow the employment of one that is equivocal in such a connection as to render the meaning ambiguous.

[D. F. Haas, 610.

(See Novelty, D, 1; Pleadings and Practice, 4.)

SUBJECTS OF PATENTS.

1. The use or employment of a thing is neither an art nor a manufacture, and it cannot be made the subject of a claim or patented.

[Thos. J. Mayall, 210.

2. An invention must be either an improvement in an art or in a manufacture, and every claim should indicate clearly for which it is intended.

[Thos. J. Mayall, 210.

3. A patent will not be granted for a proposed method of pumping water to a given height through the mere power produced by the same current of water falling back through the same distance, such a result being impossible.

[Wm. L. Smith, 349.

4. Such a method should also be condemned as not sufficiently useful or important, although this objection should be interposed with great caution, and not merely because an alleged invention is considered trivial, or shows little ingenuity.

[Wm. L. Smith, 349.

5. The construction and arrangement of dwellings and other buildings may well afford occasion for the exercise of invention, and improvements in architecture may therefore be justly held to come within the provisions of the patent law.

[Wm. Ward, 350.

6. It is a common right to place an advertisement wherever it may be eligibly displayed, and the mere idea of placing one on an anchored balloon, a thing which has been largely in use for miscellaneous purposes, cannot be monopolised.

[H. W. Gould, 611.

7. If any special adaptation of the balloon to such a purpose is resorted to, that may be the subject of a patent.

[H. W. Gould, 611.

(See Designs, 7; Invention and Skill; Priority of Invention, 5.)

SUBORDINATE PATENTS.

(See Patents, 3.)

UTILITY.

1. A patent held not to be void for want of utility in the invention upon its appearing that it possessed certain advantages over others.

[*Smith *vs.* O'Connor, 633.

2. The patent is not void for want of utility if the invention possesses it in any measure, however slight.

[*Westlake *vs.* Carter, 636.
